decomposing organic matter. Earths, nevertheless, retain the water, and supply it to the roots; they also afford the means of distributing the proper nutriment; supply, as they are wanted, those parts which are soluble, and prevent the too hasty decomposition. Notwithstanding soils are the genial aliment and support of plants, yet, from their numerous variety of roots, they require a corresponding variety of soil. Roots that are bulbous require a loose soil; such as are fibrous, one more solid, and those possessing short fibrous radicles, a soil considerably more compact and firm than those that have extensive lateral roots. Finely divided matters not only give tenacity and coherence to the soil, but greatly promote vegetation, a small quantity being sufficient to fit the soil for the production of barley or turnips. The latter have been produced upon a soil, eleven parts out of twelve of which, have been sand, and the remainder of vegetable or animal matters. Impalpable matters, however, must not be in too great a proportion. In order to promote the growth of vegetables friability and a looseness of texture are requisite in the soil; so that the water, not lying in the soil in a state of aggregation, but being suspended in it, as water in a sponge, may have free access to the fibres of the root, communicated by capillary attraction. And since alumina possesses the properties of adhesiveness, and silex those of friability, in an eminent degree, it is evident that a due mixture of both is requisite to adapt the soil to the common purposes of cultivation. The absorbent power of soil by cohesive attraction, depends in some degree upon the division of its parts, and is highly necessary to fertility, because moisture absorbed from the atmosphere, counteracts the effect of daily evaporation, and supplies the plant with moisture in the dryest seasons.—Stiff clays, which, like pipe-clays, take up the greatest quantity of water when poured upon them in a fluid form, are not the soils that in dry weather absorb the most from the atmosphere, because they cake, and present only a surface containing the absorbent power. To answer this purpose, a due mixture of sand, clay, carbonate of lime, and organized matter, are necessary to give that looseness and lightness that shall render it permeable to the atmospheric air. Regard is, however, to be had to the site and climate in which the soil is situate; the nature and contiguity of the inferior strata, declivity of position, frequency of showers, moisture of climates, &c. exerting considerable influence.

77. The division of soils into cold and hot is extremely natural: some are more heated by the sun than others; and others, though equally heated, cool in different times. Clayey soils, being clammy and moist, are heated with difficulty, and some cool chalks are difficultly heated, but retain it longer. The soils most heated by exterior causes, are perhaps black, containing much soft organized matter; coloured soils, under the same circumstances, absorb a greater degree of caloric than those of a pale complexion, especially those possessing a considerable proportion of carbonaceous or ferruginous matter. In dry soils, those that are heated with the greatest facility, cool the most rapidly; but the deepest

coloured dry soil, containing a considerable mixture of decomposed matter, cools much more slowly than a clammy, pale, earthy soil. Besides, the above soils are often characterized from the relative proportion of chemical agency which they contain, earths and earthy carbonates having a degree of attraction for many of the principles of vegetable and animal substances. If an acid solution of alumina be mixed with a solution of soap, the oily matter and alumina will unite, and forming a white powder, will sink to the bottom of the fluid. On the same principle, the extract from decomposing vegetable matter, boiled with pipe-clay or chalk, forms a combination by which vegetable matter is rendered more difficult of decomposition. Soils which contain considerable alumina and carbonate of lime, have considerable action of this kind, and from this chemical energy in the preservation of manures and other vegetable nourishment, are denominated rich soils. With siliceous sands, it is quite the reverse. The vegetable and animal matters they contain, not subject to attraction as above, are more liable to decomposative evaporation. In the case of black and brown moulds, the earth is combined with an extractive matter, which, derived from the decomposition of vegetables, is of primary importance in vegetation.

78. The quality of the subsoil is often of as much importance as that of the soil itself: it may be classed under two heads; first, when it is of the same description as the upper soil, but differing from it only in not having been loosened by ploughing, &c. and enriched by manure; secondly, where it differs in its nature from the upper soil: in this case, it is almost always of inferior quality. The much-agitated question—whether deep ploughing, or ploughing beyond the usual depth, is beneficial or not, must depend for its solution on the nature of the subsoil, and of the climate. The immediate effect of deep ploughing in all cases, must be injurious; but the injury will soon pass away, where the subsoil is of the same nature as the upper soil; whereas, if the subsoil differs materially in quality from the upper soil, especially where, as is generally the case, when it does differ, it is impregnated with the oxyde of iron; there is great hazard in deep ploughing; and the mischief can be eradicated only by much labour and expence, by frequent exposure to the air, the application of lime, &c. and by draining.

79. SOILS, IMPROVEMENT OF.—For the improvement of soils numerous methods have been devised. 1. Pulverization; this is needful in the best of soils, to facilitate the admission of air, rain, and the warmth of the atmosphere, &c. The first object of this is to give scope to the roots of vegetables, on the numerous fibres of which the prosperity of every plant in a great measure depends; and also to increase the capillary attraction of the soil by which its moisture is more uniformly applied. Water being essential to the growth of plants, not only by its immediate application as a fluid, but by that operation by which it facilitates the extraction of vegetable matters, the soil, if not naturally so, should be so constituted artificially, as to retain a requisite portion; for the want of water will impede

the germinating principle, and render even manure an ineffective auxiliary. The different species of earths being among the worst conductors of heat, it is necessary to lay the land open, and by the free ingress of the warm air, and tepid rains of spring, artificially increase its temperature. Pulverization also contributes to the increase of vegetable food, conveys water, and with it carbonic acid gas, to the roots of vegetables; accelerates the putrefaction of vegetable and animal substances by the combined action of heat, light air, and moisture; buries a portion of the atmospheric air in the soil: in short, so numerous are its advantages, that Tull and others conceived no other assistance to be necessary. No principles, however, admit of indiscriminate application; for while the pulverization of some lands contributes to their improvement, there are others that require consolidation.

80. The practice of fallowing is attended with numerous advantages to soils; the weather has free admission to their interior parts; the soil is thus heated to a degree which would be impossible, while covered with foliage: weeds are in a great measure eradicated, and the top, bottom, and middle of the soil more effectually blended. Where fallows are judiciously applied, and the land, by frequent ploughing and harrowing, left for twelve months in a state of constant tillage and movement, the profits will amply repay both the trouble and expence. Soils are to be altered by the addition of those ingredients in which they are deficient; and the subtraction of those in which they abound. Thus, a soil strongly impregnated with sulphate of iron, will be sterile; but it is to be improved by the application of quick lime: also a soil containing too great a proportion of peat, drifted sand, gravel, &c. is to be improved by taking them away, as the most simple and effectual mode.

81. The soils improved by the burning process, are those which contain too much dead vegetable fibre; and which, in consequence, lose from one third to one half their weight by torrefaction; and those which contain a super-abundance of stiff clays and marls; but poor sandy soils are injured by this process. The common advantages of incineration are, that it renders the soil not only less compact, but less tenacious, and retentive of moisture; affording considerable improvement to such as are cold and damp. It diminishes the coherence, and tenacity of clays, and destroys useless vegetable matter, converting it to manure. The water of the soil should be withdrawn when abundant, and when deficient should be supplied. Stagnant water is exceedingly pernicious to all classes of useful plants. Springs are more injurious than surface water, as being colder and generally permanent. Hence the propriety of under-draining, &c. as well as removing every obstacle that would prevent the percolation of water to the strata below. See HYDRAULICS.

82. The great art of irrigation is to imitate nature in all her various modes of communicating moisture; observing especially, to apply water in the morning and evening, at moderate intervals, and under a clouded sky. It may be applied by surface or subterraneous irrigation. Employed too often, it would have the same

effects as attend stagnant water, land springs, or aquatic soils, and administered after hot sunshine, or after violent heats, would check evaporation, and destroy life. That water which breeds the best fish, is in general the best for watering meadows; and often the imitation of the overflowing of alluvial lands, may be in many cases successfully employed to manure and enrich the soil. Shading, sheltering, &c. whether by walls, hedges, or plantations; changing the condition of lands, with respect to solar influence, by erecting mounds, forming slopes, so that the surface may be more or less at right angles with the plane of the sun's rays, have frequently a very beneficial influence upon the quality of the soil.

83. PRINCIPLES OF ROTATION. Growing different crops in succession approves itself to the practical cultivator, however much its propriety may be questioned by the pertinacity of chemical refinement. The principles of this rotation, as laid down by the most eminent agriculturists, are: First. That every plant exhausts the soil. Second. That all plants do not exhaust the soil equally. Third. Plants of different kinds do not exhaust the soil in the same manner. Fourth. All plants do not restore to the soil the same quality or quantity of manure. From these principles the following inferences have been drawn. 1. That no soil, however well it may be prepared, can long nourish crops of the same kind in succession. 2. Every crop exhausts the soil more or less, as more or less is restored by the plant cultivated. 3. Such plants as root perpendicularly, and such as root horizontally ought to succeed each other. 4. Those plants favourable to the growth of weeds, ought not to succeed each other; nor should plants of the same kind return too speedily in rotation. 5. Plants remarkable for exhausting the soil, as the grains and oil-plants, should be sown only when the land is in a proper state. 6. In proportion as a soil exhausts itself by successive crops, it should be sown with such plants as exhaust but little. The application of these principles to practical farming will be given under the article Husbandry. A few general observations, however, on the two grand divisions of crops cultivated by the farmer may be added, as the due alternation of these, forms the most simple and fundamental principles on which every rotation ought to proceed. The crops raised by the farmer are of two kinds, culmiferous and leguminous, differing widely from each other. Wheat, rye, barley, oats, rye-grass, are of the first kind; of the other kind are, peas, beans, clover, cabbage, and many others.

84. Culmiferous plants, says Bonnet, have three sets of roots. The first issue from the seed, and push to the surface an upright stem; the second set issue from a knot in that stem; and a third from another knot, nearer the surface. Hence the advantage of laying seed so deep in the ground as to afford space for all the sets. Leguminous plants form their roots differently. Peas, beans, and cabbage, have sets of small roots, all lifting from the seed, like the outermost sets of culmiferous roots; and they have no other roots. A potatoe and a turnip

have bulbous roots. Red clover has a strong tap root. Some plants rob the soil, others are genial to it. Culmiferous plants, having small leaves and few in number, depend mostly on the soil for nourishment, and little on the air. During the ripening of the seed they draw their nourishment from the soil, as the leaves, by this time being dry and withered, must have lost their power of drawing nourishment from the air. Culmiferous plants are chiefly cultivated for their seed, and are not cut down till the seed be fully ripe. But such plants, while young, are all leaves; and in that state draw most of their nourishment from the air. And the foggage, excluding the frost by covering the ground, keeps the roots warm. A leguminous plant, by its broad leaves, draws much of its nourishment from the air. A cabbage, which has very broad leaves, and a multitude of them, owes its growth more to the air than to the soil. A cabbage cut and hung up in a damp place, preserves its verdure longer than other plants. A seed is that part of a plant which requires the most nourishment; and for that nourishment a culmiferous plant must be indebted entirely to the soil. A leguminous crop, on the contrary, when cut green for food, must be very gentle to the ground. Peas and beans are leguminous plants; but being cultivated for seed, they seem to occupy a middle station; their seed makes them more severe than other leguminous crops cut green; their leaves, which grow till reaping, make them less severe than a culmiferous plant left to ripen.

85. These plants are distinguished no less remarkably by the following circumstance: All the seeds of a culmiferous plant ripen at the same time. When they begin to form, the plant becomes stationary, the leaves wither, the roots cease to push, and the plant when cut down is blanched and sapless. The seeds of a leguminous plant are formed successively; flowers and fruit appear at the same time in different parts of the plant. This plant accordingly is continually growing, and pushing its roots. Hence the value of bean or peas straw above that of wheat or oats; the latter is withered and dry when the crop is cut; the former green and succulent. The difference therefore, with respect to the soil, between a culmiferous and leguminous crop, is great. The latter, growing till cut down, keeps the ground in constant motion, and leaves it to the plough loose and mellow. The former gives over growing long before reaping; and the ground by want of motion, turns compact and hard. Nor is this all. Dew falling on a culmiferous crop after the ground begins to harden, rests on the surface, and is sucked up by the next sun. Dew that falls on a leguminous crop, is shaded from the sun by the broad leaves, and sinks at leisure into the ground. The ground accordingly, after a culmiferous crop, is not only hard, but dry; after a leguminous crop, it is not only loose, but soft and unctuous.

86. Of all culmiferous plants, wheat is the most severe, by the long time it occupies the ground without admitting a plough. And as the grain is heavier than that of barley or oats, it probably requires more nourishment. Culmiferous crops

are not robbers when cut green; the soil, far from hardening, is kept in constant motion by the pushing of the roots, and is left more tender than if it had been left at rest without any bearing crop. Bulbous-rooted plants are peculiarly useful in dividing and pulverizing the soil. Potatoe roots grow six, eight, or ten inches under the surface; and by the size and number, they divide and pulverize the soil better than the plough; consequently, whatever be the natural colour of the soil, it is black when a potatoe crop is taken up. The potatoe, however, with respect to its quality of dividing the soil, must yield to a carrot or parsnip; which are large roots, and pierce often to the depth of eighteen inches. The turnip, by its tap-root, divides the soil more than can be done by a fibrous-rooted plant; but as its bulbous root grows mostly above ground, it divides the soil less than the potatoe, the carrot, or the parsnip. Red clover, in that respect, may be put in the same class with turnips.

87. Whether potatoes or turnips be the more gentle crop, is a puzzling question. The former bears seeds, and probably draws more nourishment from the soil; potatoes divide the soil more than turnips, and leave it more loose and friable. It appears no less puzzling, to determine between cabbage and turnip; the former draws more of its nourishment from the air, the latter leaves the soil more free and open. The result of the whole is that culmiferous plants are robbers; some more, some less; they at the same time bind the soil; some more, some less. Leguminous plants in both respects are opposite; if any of them rob the soil, it is in a very slight degree; and all of them without exception loosen the soil. A culmiferous crop, however, is generally the more profitable; but few soils can long bear the burden of such crops, unless relieved by interjected leguminous crops. These, on the other hand, without a mixture of culmiferous crops, would soon render the soil too loose.

88. These preliminaries will carry the farmer some length in directing a proper rotation of crops. Where dung, lime, or other manure can be procured in plenty to recruit after severe cropping, no rotation is more proper or profitable in a strong soil than wheat, peas or beans, barley, oats, fallow. The whole farm may be brought under this rotation, except so far as hay is wanted. But as such command of manure is rare, it is of more importance to determine what should be the rotation when no manure can be procured but the dung collected in the farm. Considering that culmiferous crops are the more profitable in rich land, it would be proper to make them more frequent than the other kind; but as there are few soils in Scotland that will admit such frequent culmiferous crops without suffering, it may be laid down as a general rule, that alternate crops, culmiferous and leguminous, ought to form the rotation. Nor are there many soils that will stand good, even with this favourable rotation, unless relieved from time to time by pasturing a few years. If such extended rotation be artfully carried on, crops without end may be obtained in a tolerably good soil, without any manure but what is produced in the farm. Clay answers best

for wheat, moist clay for beans, loam for barley and peas, light soil for turnip, sandy soil for rye and buck-wheat; and oats thrive better in coarse soil than any other grain. Now, in directing a rotation it is not sufficient that a culmiferous crop be always succeeded by a leguminous: attention must always be given that no crop be introduced that is unfit for the soil. Wheat, being a great binder, requires, more than any other crop, a leguminous crop to follow. But every such crop is not proper; potatoes are the greatest openers of soil; but they are improper in a wheat soil, neither will turnips answer, because they require a light soil. A very loose soil, after a crop of rye, requires rye grass to bind it, or the treading of cattle in pasturing; but to bind the soil, wheat must not be ventured; for it succeeds ill in loose soil.

89. Another consideration of moment in directing the rotation, is to avoid crops that encourage weeds. Peas are the fittest of all crops for succeeding to wheat, because it renders the ground loose and mellow, and the same soil agrees with both. But peas are improper, unless the soil be left by the wheat perfectly free from weeds; because peas, if not an extraordinary crop, foster weeds. Barley may be ventured after wheat, if the farmer be unwilling to lose a crop. It is indeed a robber; better, however, any crop, than run hazard of poisoning the soil with weeds. But to prevent the necessity of barley after wheat, the land ought to be fallowed before the wheat; it cleans the ground thoroughly, and makes peas a secure crop after wheat. And after a good crop of peas, barley never fails. A horse-hoed crop of turnips is equal to fallow for rooting out weeds; but turnips do not suit land that is proper for wheat. Cabbage does well in wheat soil; and a horse-hoed crop of cabbage which eradicates weeds, is a good preparation for wheat to be succeeded by peas; and a crop of beans, diligently hand-hoed, is in that view little inferior. As red clover requires the ground to be perfectly clean, a good crop of it ensures wheat and next peas. In loam, a drilled crop of turnips or potatoes prepares the ground, equal to a fallow, for the same succession.

90. Another rule is, to avoid a frequent repetition of the same species; for to produce good crops, change of species is no less necessary than change of seed. The same species returning every second or third year, will infallibly degenerate, and be a scanty crop. This is remarkably the case with red clover. Nor will our fields bear pleasantly perpetual crops of wheat after fallow, which is the practice of some English farmers. Hitherto we have treated of rotation in the same field; which is, to avoid crowding crops one after another in point of time; but to choose such as admit intervals sufficient for leisure dressing, which gives opportunity to manage all with the same hands, and with the same cattle; e. g. beans in January or February, peas and oats in March, barley and potatoes in April, turnips in June or July, wheat and rye in October.

91. It is of capital importance to have the whole of the manure employed, so that those parts which are not fitted for one crop may remain

as nourishment for another. If turnip is introduced upon a soil, this crop, recently manured, finds the soil kindly disposed towards germination. If barley, with grass seeds, be the next in succession, the land having been little exhausted by the turnips, finds sufficient nourishment for the grain, while the grasses or clover, requiring little aliment, probably derive the gypsum which would be useless to other crops. The roots and leaves of those plants ploughed in at the end of two years, afford manure for the wheat crop; and as soon as the most exhausting crop is taken, recent manure is applied. Peas and beans always seem adapted to prepare the ground for wheat; and in rich lands are sometimes raised in alternate crops for years together. On the whole, nothing can be more evident than that, though the general composition of plants is analogous, their specific difference in their products, must be derived from different materials in the soil. Hence lands in a course of years cease to give good grasses; and strawberries and potatoes, although they flourish exceedingly in virgin mould, degenerate in a few years and require fresh mould. The influence of rotation of crops in destroying insects, is too important to be passed over in silence. The myriads of these creatures that live upon the collar or crown of the cereal grasses, are chiefly tipule, and musce, which, when the soil presents the same crop for several years in succession, multiply themselves without end; but when a crop intervenes in which these insects cannot live, the whole race perish from the field.

92. MANURES. Our consideration will now be directed to the subject and proper use of manure, including every species of matter capable of promoting the growth of vegetables. Since vegetables are composed of oxygen, hydrogen, nitrogen, or azote, and carbon, with a portion of saline bodies, vegetable aliment requires to be composed of the same elements. Hence decaying animal and vegetable substances form the most important class of manures; and when deposited in the soil are consumed during the process of vegetation. The great object in the application of manure is to make it afford as much soluble matter as possible to the roots of the plant, in a manner so slow and gradual that it may be entirely consumed in forming its sap and organization. Whenever manures consist principally of matter, soluble in water, as is the case with organic manures generally, their fermentation or putrefaction should be prevented as much as possible, by preserving them dry, defending them from the contact of air, and keeping them as cool as possible. The different species of manures are extremely various; containing different proportions of the requisite elements of vegetation, and requiring a different treatment in their practical application. Plants which are green and succulent contain saccharine or mucilaginous matter; and like sea-weed, when intended for manure, should be used as fresh as possible. Rape-cake, malt-dust, and linseed-cake make excellent manure when judiciously applied. Dry straw of wheat, barley,

oats, beans, peas, &c. are used with advantage, although, perhaps, too indiscriminately, they are made to ferment before they are employed. It may be doubted whether any vegetable substance except woody fibres and inert peaty matter, which is of much the same nature, requires this process. In general vegetable manures ought, as much as possible, to be applied to the nourishment of plants of their own species. Animal substances used as manure require no chemical preparation to fit them for the soil; and the only care requisite is, to blend them with earthy constituents, and prevent their too rapid decomposition. Fish make excellent and powerful manure, though it cannot be ploughed in too fresh. The effects of the refuse pilchards, thus employed in Cornwall, were perceived for several years. Oily substances, as blubber, have been applied with success. The powerful effects of bones, when properly ground, are well known; and horn, as it contains a large quantity of decomposable acrid matter, is a still more powerful manure than even bone. Hair, woollen rags, feathers, the refuse of skins, and leather chippings, putrid urine, and in short all the excrementitious animal substances, form excellent manures. Soot is also well fitted to be used in the dry state.

93. Organic manures, it is to be feared, are generally suffered to decompose too much before they are applied. An incipient fermentation is favourable; but rather than it should be carried too far, better if there were no fermentation at all. Manure to be preserved, should be kept under sheds, or at least be defended from the sun. This, though it would be an additional care and little more expence, would increase the harvest and enrich the farm. Animal substances decompose rapidly by being buried in the soil, and care should be taken in their proper application to the field. Organized forms are in the earth resolved into their chemical constituents; and after having lived their day fall into dust, and become the food of others. From their fermentation and putrefaction forms of beauty and usefulness emerge; the fetid gas constitutes the aroma of the flower; and what might be poison, distilled over again, is formed into nourishment. See CHEMISTRY.

94. MINERAL MANURES.—Mineral manures are of more recent invention and uncertain application than those of which we have already treated; yet the propriety of their use depends not only upon laws of chemistry, but just inductions from facts. It seems a fair conclusion, that the different earths and saline substances found in the organs of plants, are supplied by soils in which they grow. Thus compound forms are produced by the combination and chemistry of simple air; and the elements of the soil, the atmosphere and the earth absorbed, and made to form themselves in different proportions, into the most diversified and beautiful structures. Alkaline earths unmixed with the remains of any matter of organized beings, are the only substances which can, with propriety, be called mineral manures; and of those, though potassa and soda, the two fixed alkalies, are used occasionally in some of their chemical compounds; lime and mag-

nesia are the only ones that have been employed in their proper state. The most common form in which lime is found on the territorial surface, is in a state of combination with fixed air or carbonic acid; and if thrown into a fluid acid, will cause an effervescence by the emission of its carbonic acid gas. Quick lime, when first made, is caustic and burning to the tongue, is soluble in water, and renders vegetable blues green; but when combined with carbonic acid gas, it loses these properties, regains its powers of effervescing, and becomes chemically the same as chalk and lime-stone. Few limestones or chalks consist entirely of lime and carbonic acid; but are mingled with alumine, or aluminoous earth, oxide of iron, magnesia, &c. But all its different ingredients variously modify their properties, when limestone is used as manure. Quick-lime is injurious to plants, when administered in its pure state; but in its state of combination with carbonic acid, becomes a useful ingredient in the soil; and falling in contact with fibrous vegetable matter, forms a compost of which a part is soluble in water; thus rendering that matter nutritive which was before inert. Mild limes, marls, chalks, or powdered limestone, have no action of this kind. They have no tendency to form soluble matters; but prevent the too rapid decomposition of substances already dissolved. Hence the operation of these differs from that of quick-lime, being useful only to improve the texture of soils in its power of absorption; whereas the former converts hard vegetable matter into proper nutriment, by bringing it into a state of more rapid decomposition and solution. From these general principles, it follows that the propriety or impropriety of applying quick-lime to a soil, depends upon the quantity of inert vegetable matter that it contains. The propriety of employing marl, mild lime, or powdered limestone, depends upon the quantity of calcareous matter already in the soil. One capital rule to be observed is, that all soils which do not effervesce with acids, and sands more than clays, are improved by the application of lime, and ultimately by quick-lime. Lime should never be applied with animal manures, except they are too rich; or for the purpose of preventing noxious effluvia. It possesses, however, two great advantages for vegetable nutrition. It forms certain insoluble bodies to soluble compounds, and also prolongs the nutritive action of substances beyond the term which they would retain them, independent of such combination. Magnesian limestone is used with good effect in application to peats. The Lizard, one of the most fertile parts of Cornwall, has mild magnesian earth mingled with the soil. Calcareous matter is also applied for agricultural purposes in other combinations, one of which is, gypsum or sulphate of lime. Plaster of Paris is of this nature. Gypsum was introduced into America with great success by Dr. Franklin, on his return from Paris. The ashes of sainfoin, clover, and rye-grass afford considerable quantities of gypsum, which in all probability, forms a necessary part of their woody fibre. Gypsum is contained in stable dung, and the dung of all cattle fed on grass. Hence, it is probable that gypsum might be suc-

cessfully employed in the cultivation of these substances, and form an efficacious species of manure. Sulphate of iron or green vitriol, are efficacious in calcareous soils; otherwise all vitriolic impregnations are injurious. Phosphate of lime, a combination of lime and phosphoric acid, is thought necessary to the cultivation of corn, and white crops in general. The saline compounds of magnesia and wood-ashes, are employed in some cases by eminent agriculturists. Soda, or mineral alkali, is found in the ashes of seaweed, and may be obtained from common salt; even salt itself being offensive to insects, and assisting the decomposition of animal or vegetable matter, may be applied in small quantities in the form of manure. In Cornwall, a refuse salt, mingled with some of the oil and exuviae of fish, makes excellent manure. Sulphate of potassa, nitre, muriate, and carbonate of ammonia, are strongly recommended as manure. Soot owes a great measure of its efficacy to the ammoniacal salt it contains.

95. AEROLOGY.—The other agents in vegetation are heat, light, electricity, water, &c.; to which we may add the atmosphere, with its elements and changes.

96. The heat radiated by the sun to the earth, would, if suffered to accumulate, speedily destroy its constitution; but its deleterious effects are prevented by the nocturnal radiation of heat to the heavens; when the surface of the terraqueous globe, having become colder than the contiguous fluid, condenses the watery vapour in the form of dews, falling where it is most wanted, on herbage and low plants. Dense clouds, near the earth's surface, reflect back again the heat they receive from it by radiation; but if they lie at considerable elevation from the atmosphere, by radiating to it less heat than they receive from it, they admit of bodies on its surface becoming considerably colder than the contiguous air. Islands and continental regions, bordering immediately upon the ocean, subject as they are to a cloudy sky, will, from the reasons assigned, be less cold in winter than regions that are more remote. Fogs proceed upon the same principle as clouds, and serve to corroborate the general rule, that, whatever impedes the passage of radiant heat, will tend to prevent bodies on the surface of the earth becoming colder than the contiguous atmosphere, the water deposited upon the earth during fogs at night, serving to bathe the vegetables, especially those that have the greatest attraction; for humidity arises from two sources, *viz.* a precipitation of moisture from the atmosphere by means of its cold, and a real formation of dew arising from the ordinary principle of condensation. Heat and cold, then, by reason of their mechanical effects produced upon the atmosphere, exert a necessary and powerful influence upon the principles and process of vegetation.

97. The hurtful effects of cold occur chiefly in hollows; and, in clear still nights, frosts are less severe upon the hills than in the plains. The tops of trees also are sometimes found dry when the grass upon the earth's surface is covered with dew, all which phenomena may be satisfactorily resolved into the philosophy of the before men-

tioned principles. Much cold is to be prevented by a slight covering, which Dr. Wells recommends to be placed at a little distance above tender plants and fruits which it is intended to shelter. He observed from experiments, that grass, slightly sheltered, was one night 8°, and another night 11°, warmer than grass fully exposed to the atmosphere, notwithstanding some disadvantages in the medium of experiment; and that grass, sheltered by a cambric handkerchief, raised a few inches in the air, was 3°, and on one occasion 4°, warmer than grass covered with a similar handkerchief, but actually in contact. Walls, in addition to other purposes which they subserve mechanically, have the advantage that they prevent the loss of heat which the contiguous plants, were they perfectly exposed, would sustain by radiation. From the same principle arises the utility of snow as a covering for vegetables in the winter. The influence of the different solar rays on vegetation, though not made perhaps so much as it ought to be the subject of study, is no doubt considerable. Plants kept in darkness, however supplied with air, heat, moisture, and every requisite species of aliment, never obtain their natural colours; nor acquire any other juices than such as are watery and saccharine.

98. Electricity has been thought to have a much greater influence on the germination of seeds than we are commonly aware; although, in the opinion of Dr. Darwin, no profitable application of it to this purpose has ever yet been discovered. Compound bodies are capable of being decomposed by it, and corn has been found to sprout much more rapidly in water negatively electrified, than when positively so. Experiments have already evinced that the clouds are usually negative, the probable conclusion is that the earth is positive. This circumstance, with the electrical changes constantly taking place in the atmosphere, and upon the terraqueous surface, demands a greater degree of attention than it has at present received.

99. The influence of the atmosphere is too well known to require any elaborate discussion. Composed of water, carbonic acid gas, azote, and oxygen, it forms a chemical compound which envelopes the earth, varies the weather, and is essential to the support and continuance of life. Its action on plants differs at different periods of their growth and development. In the exhausted receiver seeds moisten and swell, but shew no further signs of vegetation; and, if kept there, lose their living powers, and undergo putrefaction. The process is the same in pure azote, or carbonic acid. But if a healthy seed be moistened, and exposed to air of 45° temperature, germination commences, the radicle descends, and a plume is shot upward in the atmosphere. A seed examined before germination will be found to be more or less insipid; but after germination it is sweet, its coagulated mucilage being converted into sugar. It is this, which rendered soluble, and carried through the cells or vessels of the cotyledons, forms the nourishment of the infant plant. The process is evidently effected by the direct action of the atmosphere, and hence germination, unless so conducted as to leave the

deposit exposed to the influence of the air, can never produce a vigorous and healthy plant.

100. Besides the above immediate action upon vegetables, the atmosphere is subject to numerous changes, all of which exert a nearer or more remote influence upon the general business of agriculture. The first of these variations is that of temperature, considered exclusive of the different seasons and climates. The rays of the sun concentrated, have no kind of effect on air; but communicating the heat to the surface of our globe, the warmth is communicated to the atmosphere. Hence the temperature decreases in proportion to the height of the air from the earth's surface, varies according to the season, and becomes highest where the place is so situated as to receive the rays of the sun with most effect. The air and the earth, which are most heated at the equator, where the rays fall perpendicularly, gradually diminish in temperature as they approach the poles, allowing for differences of geographical position, qualities of surface, &c.; continents being colder than islands.

101. The ascent and descent of water, may be considered under the form of vapour or water, evaporated by means of rarefaction from the surface of the earth, and afterwards formed into clouds. When water is made to boil, evaporation flies off in the form of visible steam. The same process is observed, only on a much lower scale, in the daily evaporation that ascend the atmosphere. In the maritime countries this is more considerable than in those which are inland; and is greater in the warmth of summer than in the cold of winter. Dew is moisture deposited by the atmosphere on the earth, and is precipitated in proportion to the humidity contained in the atmosphere, by means of the cold of the body on which it is seen. Dr. Wells lays down the principle, on the authority of numerous facts, reasonings, and experiments, that bodies must of necessity become colder than the neighbouring air before they are bedewed. Rain is consequent upon evaporation, by which the clouds are charged with vapour. Dalton accounts for its phenomena in the following manner: 'If two masses of air, of unequal temperatures, by the ordinary currents of the winds, are intermixed when saturated with vapour, a precipitation ensues.' In proportion as the masses are under saturation, is the extent and density of the shower; and in warm air a greater quantity of vapour is precipitated under the same degree of saturation. Hail is considered as frozen rain, differing however in this respect, that hail stones are not formed of single pieces of ice, but of many little spherules, of different degrees of consistence, agglutinated together. Frost proceeding from the atmosphere commences upon the surface; and extends its influence downwards, into earths, waters, &c. Snow consists of the frozen vapours of the atmosphere, the particles of which proceeding down to the earth, are joined by numerous others of their own species, which form constant additions to their bulk. Its whiteness is the consequence of its division into an exceeding variety of little particles, as will appear from the fact, that ice when finely

powdered will exhibit the same appearance. Ice is water in a state of congelation, increased one eighth part of its bulk by the process of transmutation. It remains at the temperament of thirty-two degrees of Fahrenheit, and acquires its increased dimensions with a force which would burst the strongest vessels, and even pieces of artillery. It freezes more rapidly than it thaws.

102. Wind is air in motion. It is necessary to carry off putrid exhalations, to purify the air and preserve it fit for respiration. The prevailing winds in our own country, as stated by the Royal Society of London, are

	At Glasgow.
North . . .	16 days.
South . . .	18
East . . .	26
South East .	32
West . . .	53
North West .	50
North East .	58
South West .	112

103. As the winds carry the clouds along with them, much depends on them with regard to the local and more general diffusion of rains. For proper acquaintance with their prevailing directions, for the phenomena of thunder, as also for curious and interesting information relative to the prognosticating of weather, &c. See METEOROLOGY AEROMANCY, &c.

104. We must now be allowed to offer, as supplementary to the general information contained in this section, a slight sketch of those general views and principles of the animal system, with which the scientific farmer should certainly be acquainted. This system has much less engaged the attention of naturalists than botany. In describing animals they have followed the same rules as those commonly observed in the naming of plants; but the classification of them is by no means established on so firm and philosophical a basis. The system of Linnæus is founded on a particular system of organs. Another system has been founded on the joint consideration of all the systems of organs external and internal. On the basis of this has been established several natural methods, particularly that of Cuvier. But several naturalists have adopted a mixed method, as being, in their opinion, the most convenient. The male is understood in all cases to be the representative of the species; and the female, although greatly differing in appearance from the male, presents, with the exception of the re-productive organs, a perfect agreement in structure. So long as the internal structure was entirely or partially overlooked, the classification of female individuals was a work of great difficulty; but by attending to the internal peculiarities, the arrangement is comparatively easy.

105. ANATOMY.—From these considerations the anatomy of animals becomes a primary object of consideration, and may be regarded as external and internal.

106. EXTERNAL ANATOMY.—That which is exterior, relates to the covering or skin of animals, which includes the cuticle, the corpus mucosum, the corium, the panniculus, and the cellular web. The cuticle is destitute of nerves, fibres,

and blood vessels, and consists of a thin transparent membrane, in many cases so soft and delicate, that it appears like mucus. The corpus mucosum lies beneath the cuticle, and the true skin below. The corium, or true skin, is entirely destitute of colour, and in some animals consists of solid fibres, which cross one another in every possible direction, forming an extensible elastic substance, penetrated by a delicate net-work of blood-vessels and nerves. The muscular web consists of a layer of muscles, the extremities of whose fibres are externally inserted in the corium. The use of this layer of the integument is to congeate the skin; and may be observed in the human species in the upper parts, moving the skin of the face, cheeks, and head. The cellular web forms the innermost layer of the common integuments, and rests immediately on the flesh of the body. The appendices of the skin are hairs, feathers, horns, scales, shells, and crusts. Hair is the most permanent of all the substances consisting of animal matter, and resists putrefaction the longest. It grows by a root in the form of a bulb, taking its rise in the cellular web, from which it passes through the corium, inucus web, and cuticle. In some species the hair falls off, and is reproduced annually. Hairs are generally round, but sometimes flat, two-edged, and thickest in the middle. Sometimes they are long and straight, at others curled and crooked. When crisped they are called wool; when stiff, they are called bristles; and when inflexible, they are called spines. Feathers are of different colours, depending in some birds upon seasons, food, &c. They are readily reproduced, and renewed periodically. The parts of the feathers are, the quill, which takes its rise in the cellular membrane; the central portion, a shaft of a texture resembling cork, and the web which clothes the sides, composed of barbes, each of which is again clothed with barbulæ. Horns are considered as hairs so agglutinated as to form a hollow cone; and at the base where it unites with the skin, its fibrous texture may in many animals be seen. The apex of the cone is in this part pushed out in proportion to the increase originating at the root. There is, however, this difference between horn and hair, that the former has its central cavity filled by a bony or other solid projection from the body; whereas the central part of the latter is composed of medulla or pith. The different markings of horns, particularly the transverse ridges, indicate the different layers of growth, and correspond in some cases with the years which the animal has lived. They do not experience those periodical renovations which are common to hairs and feathers; and the case of the stag forms no real exception, inasmuch as the deciduous parts are not true horns. Various appendices of the skin are included under this general denomination; as beaks, which cover the maxillary bones of birds; hoofs, which are peculiar to certain herbivorous quadrupeds; claws, having a bony centre and covering the extremities of the feet in animals; nails, covering the fingers and toes of the human species, and differing from horns in the circumstance of their not being tubular, but consisting of a plate, convex on the exterior; and spurs occurring upon the

legs of gallinaceous birds. The use of horns in every modification of them is to prevent the parts that are particularly tender from being injured by coming into immediate contact with hard bodies. From the skin arise three different kinds of secretions; one lubricates the skin itself, another regulates the temperature of the body, and a third carries off superfluous carbon. Unctuous secretions are peculiar to warm-blooded animals, whose cellular web is filled with fat. Viscous secretions are peculiar to animals of cold blood, but answer the same purpose of defending the skin from the action of the surrounding element.

107. INTERNAL ANATOMY.—The internal anatomy of animals, includes the entire structure, osseous, muscular, and nervous. The structure of the bones is the first consideration with respect to the strength and locomotion of animals. Bones are composed of the periosteum; the texture of which is obviously fibrous, serving the same purpose to the bone as the skin with respect to the body; the cartilaginous basis consisting of gelatine, and coagulated albumen; earthy matter, which is chiefly phosphate of lime, and fat, resembling fixed oils. Bones increase in size by the expansion of the cartilaginous basis; which, when saturated with earthy matter, is capable of further extension. Bones are readily reproduced, especially in youth, as in case of fracture. In animals of the deer kind, the horns which are the true bones, are shed annually, and reproduced. The articulation of bones exhibit numerous varieties in respect to surface, connection, and motion. The only two which we shall introduce into the present article, are motionless junctions, and joints. In the former, the connecting surfaces of bones come into immediate contact, as in the serrated edges of the bones of the human skull; or when a pit in one bone receives the extremity of another, like a wedge, as in the case of the human teeth. Sometimes one bone has a cavity with a protuberance at its centre, which receives another bone, as in the claws of cats, seals, &c. In the osseous structure of the human species, the ribs are united with the breast-bone by means of cartilage, as are the two sides of the lower jaw, with each other in vertebral animals. In joints, the articular surfaces are enveloped with cartilage, intimately united to the bone which they protect. Muscles are the organs by which motion is executed. They appear in the form of large bundles, consisting of cords, which again are divided into smaller threads, capable of a still further subdivision with their primary filaments. The muscles with their component cords and filaments, are individually enveloped by a covering of cellular membrane, supplied by nerves and blood-vessels; whilst at the extremities of the muscular fibres lie the sinews, of a silvery colour, possessing great tenacity, and exhibiting a firm, though fibrous texture, which forms a passive link from the muscle to the bone. The muscles possess the power of irritability, execute all the motions of the body, and are the most active members of the frame. Standing, walking, leaping, flying, in short, every species of action being attributed to their instrumentality. The nervous system is that which contains the organs of sen-

sation or volition. It includes the brain, spinal marrow, and the nerves. The brain exhibits a slightly viscous mass. The spinal marrow originates in the brain, and consists of four cords, united in one body. The nerves also originate in the brain, or spinal marrow, from different parts of which arise several filaments; uniting, they form the trunk of a nerve, which subdivides in various ways, spreading its ramifications over the whole system, under the form of plexus or net-work; between the different parts of which, a perfect connection is maintained.

108. DIGESTIVE ORGANS.—Of the digestive system of animals, it will be necessary to take some notice. Animal appetite originates from the activity of the organs of the stomach, and is prompted by cold air applied to the skin; by exercise; or by cold, acid, or astringent fluids introduced into the system. Thirst is occasioned by the excessive expenditure of the fluids, and originates in a variety of causes. Of hunger and thirst, there are many remarkable varieties. Sometimes they are directed after the objects of the animal kingdom, when the subject of the sensation is said to be carnivorous; piscivorous, when directed towards fishes; insectivorous, when directed towards insects; if directed towards seeds, granivorous; if towards grasses, graminivorous, &c. &c. For the process of digestion and circulation, see ANATOMY.

109. REPRODUCTIVE SYSTEM.—In the reproductive system of animals, it is the business of the female to prepare the germ, or ovum, and bring it to maturity; whilst the office of the male is to impregnate the germ, by means of the spermatic fluid secreted in the testicles, and transmitted by its appropriate organs. The germ thus impregnated, is farther improved in the uterus, and eventually brought forth in the ordinary way of nature. In viviparous animals the reproductive organs are in general similar; but with the sexual organs of the oviparous tribes it is otherwise; and the manner in which the eggs of birds are impregnated by the male has never been properly determined.

110. PATHOLOGY.—Animal life is exposed to numerous accidents, diseases, and casualties. Health is precarious; which circumstance renders animal pathology an important subject to understand. The health and longevity of animals depend, in a great measure, upon the organs of respiration and digestion, and the manner in which they perform their various functions. In cases where the air of the atmosphere, or water contains noxious particles, it brings on epidemic and endemic diseases, as the epizooty, or the murrain, which attacks horses, sheep, and cows, called by some farmers, the distemper. Scarcity is exceedingly detrimental to animals. It engenders diseases; and for the diseases of cattle, we have few effectual antidotes. There is also a war maintained all over the animal kingdom; tribe is divided against tribe; so that few animals, comparatively, live to the period of natural death.

111. The most important uses of animals to the agriculturist are labour, clothing, and food. With these views they are reared, domesticated,

and form important and useful additions to the farm. The chief employed, or retained on British farms, are the horse, ox, sheep, swine, fowls, &c.

112. BREEDING.—In the breeding of animals, an object of primary importance is the selection of the parents. Two theories have, however, obtained with respect to this subject, viz. breeding from individuals of the same parentage, called the in-and-in system; and breeding from individuals of two different offspring, called cross-breeding. It is a common mistake, that the breed of animals is improved by the largest males; and cross-breeding has only succeeded, to any extent, in those instances where the females were larger than the usual proportion. The external form is to be studied only as an indication of internal structure. The lungs are of the first importance; since on their size and soundness depend, in a great measure, the health and strength of the animal. The chest, which indicates the size of the lungs, should approximate to the figure of a cone, having its apex situated between the shoulders, and its base towards the loins. The head should be small. This not only indicates a good breed, but facilitates the birth. The length of the neck should be proportioned to the height of the animal. The muscles should be large. Large bones generally indicate imperfection in the organs of nutrition. Of the external appearances, by which varieties of the same species are distinguished, those of the male parent most frequently predominate in the offspring: thus, if a hornless ram be put to horned ewes, almost all the lambs will be hornless. In Norfolk, crossing with the Ryeland rams would effectually remove the horns, enlarge the chest, and improve the quality of the wool. The same may be said of Devonshire cattle, with respect to Galloway bulls. The good effects of cross-breeding are evident in the improved state of English horses; by crossing with diminutive stallions, Barbs, and Arabians. But when it became fashionable in London to drive large bay horses, the farmers in Yorkshire, by putting their mares to very large horses, produced a race of small-chested, large-boned, long-legged, worthless animals, and thus exhibited the bad effects of cross-breeding, where injudiciously applied.

113. REARING.—Immediately after the birth of every animal, its immediate nourishment is supplied by the mother, for which reason, the latter, during her gestation and afterwards, should be carefully attended to and well supplied. As the animal increases in size and strength, it should have abundance of food, air, and exercise, to lay the foundation of a firm and vigorous constitution. Food, however, though supplied in abundance, ought not to be given to satiety: even animals feeding on a rich pasture have been found to improve by being taken from it once a day, and put into a fold on inferior pasture. If rich food is supplied to young growing animals, and exercise withheld, diseases are generated, and growth is impeded. Good air and water are necessary to feeding all species of animals with success. Tranquillity, comfort, and cleanliness should be attended to; and where, in addition to these, animals are sheltered in sheds and houses, so

as to moderate the different extremes of weather, a good state of health will be the natural consequence. The feeding of animals for extraordinary labour or for long journeys, should be effected by dry rich food; rubbing, cleansing, and warmth in the intervals between labour and rest, will be found very powerful auxilia-

114. SECT. III.—HISTORY OF AGRICULTURE, WITH A SKETCH OF ITS PRESENT STATE. We shall now conclude our observations with a brief abstract of the history of agriculture from the earliest periods, and a rapid sketch of its present state. Chronologically, the science of agriculture may be traced to the period immediately succeeding the deluge, when it formed the principal occupation of Noah and his descendants. The plains of Shinar, no doubt, witnessed the earliest improvements; Egypt, Greece, and Carthage, successively, the dawn, day-break, sunrise, and ascensional development of this interesting pursuit, whether viewed abstractedly as a theory of scientific principles, or in its application as a useful art. Through the above route agriculture has been conveyed to our part of the world, on the changing and crooked high-road of political revolution and emergency. In China and the eastern countries, whose antiquity is celebrated as so justly sublime, it was, perhaps, coeval with their early plantation and government, and has been retained through all the periods of time; has stood like the colossus of Rhodes, and lusted the hemisphere; while the rapid and more aggrandized improvements of military republics, shaken by the earthquakes to which warlike nations are liable, have fallen to ruin and decay. Of the agriculture of the ancients little is known. That which is distant is always partially obscured, and presents little else than a covering of clouds; and although books, like glasses, bring distant objects near, we have few glasses of sufficient focus to reach the stretch of time, not to say that through a glass vision is dark, and detail is not to be expected. The geographical situation of Egypt presented many advantages for cultivation. During the famines of Palestine there was corn in Egypt, to which Abraham and his descendants had frequent recourse. ‘The plain of Jordan was every where as the garden of the Lord.’ The aboriginal Greeks or Pelasgi, are supposed to have been taught the art in Egypt. Of the agriculture of the Phœnicians and Jews, little is known, except that it appears to have originated in the same source with that of other nations, viz. the family of Noah. Different nations have had their different productions and modes of culture: their traditions ascribe the invention to different personages, as Osiris, Ceres, Triptolemus, Janus, Chin-hong, &c. but this was the common origination;—this was the parent stream which came flowing out of even antediluvian antiquity; and which, dividing like the rivers of Paradise, began to advance over the earth, and beautify the face of nature; supplying innumerable myriads of creatures with the instruments and aliment of life; opening by mysterious development sources of the most rational enjoyment; and fulfilling, in an inferior sense, the sublime language of prophecy: ‘I will make the

wilderness like Eden, and the desert as the garden of the Lord.’

115. Agriculture amongst the Romans, in its different modes and stages, is capable of being ascertained with a much greater degree of certainty. Roman authors on this subject are numerous amongst whom may be enumerated the names of Cato, Varro, Virgil, Pliny, Palladius, and Columella. The peculiar manner in which agriculture was carried on at Rome, was the primary cause of that notable success which attended it. Romulus having conquered a small part of Italy, divided the land among his followers, allowing, by an agrarian law, two jugera, or $1\frac{1}{2}$ acre, to every citizen. Six centuries before the Christian era, at the expulsion of the kings, seven yoke, or $3\frac{1}{2}$ acres, were allotted. The same custom, with respect to the distribution of conquered lands, continued to be observed; and after every division, the remainder being sold in lots, any citizen might acquire as much land as he could purchase, till a new law passed by Stolo, the second plebeian consul, B. C. 377, enacted that no person should possess more than 500 jugera. In the first ages of the commonwealth, and for four or five centuries afterwards, the lands were cultivated by the proprietors themselves, whence corn became very abundant. But when Rome acquired an immense stretch of territory, and spread her conquests far and near, rich individuals were allowed to purchase large estates, and to cultivate them by means of bailiffs and farmers. In the time of Columella, land was cultivated by farmers and servants, the latter including free servants and slaves. It was cultivated by slaves in the time of Pliny the elder. This change in the managers of the soil, produced a corresponding effect upon agriculture. Varro complains, that in his days the degree of attention bestowed upon this useful art had very much declined; and Columella tells us, that in his time it was almost entirely neglected.

116. The surface of Italy is irregular, broken by prominent hills, which pass through its whole length, forming numerous interior valleys of different dimensions, watered by lakes and rivers. The climate is dry, clear, regular, and of warm temperament. The soil is various; as yellow marley clay, blue clay, containing sulphur and alum, volcanic earth, rich black loam, deep, soft, moist earth, &c. The artificial appearance of Italy greatly resembles what it was in the time of the Romans. The cultivated lands and open enclosures, are to be seen only near the villas; and the landscape, (as Daniel Malthus observes,) which Pliny mentions, as seen from his villas two thousand years ago, does not appear to have been different from what it is at present. “Romans selected those spots for their farms which were remarkable for their geographical advantages; and employed themselves in the cultivation of them from their youth. They built the villa in proportion to the size of the farm. The villa was divided into three parts. 1. The *urbana*, consisting of the apartments of the landlord. 2. The *rustica*, containing the kitchen, servants’ houses, stables, piggeries, &c. adjoining to which was commonly the aviary or apiary, a place for dormice, a warren for hares and rabbits, a place

for snails, and a large park for live deer, and beasts taken in the chase. 3. The *fructuaria*, containing oil and wine cellars; places for the oil and wine presses, barns, store-houses, repositories for fruit, corn-yards, granaries, &c. Particular directions have been given as to the relative situation and construction of these buildings, but nothing as to the materials of which they were composed. Pliny proportions the whole expence to the profits arising from the farm; so that if it were destroyed, one, or at most two years' rent, might be sufficient to rebuild it.

117. With respect to domestic management, a farmer fed and clothed his own servants; and bailiffs were appointed, whose office it was to see that they were fed on wholesome provisions, and made comfortable. The beasts employed were chiefly the ox, the ass, and mule; the horse but seldom. Oxen were most commonly employed in the field, and were worked in pairs, whether in the cart or plough. Asses were chiefly used for the burden, the mill, or for ploughing, where the land was light. Of mules, they had two descriptions; mules properly so called, and hinni, the first being the offspring of a mare and an ass, and the second of a horse and an ass. Both were commonly used for the road and the plough.

118. The implements used in Roman agriculture are very little known. Cato mentions two kinds of ploughs, one for strong, the other for light soils. Varro mentions one with two mould boards, for the purpose, he observes, of ridging when they plough after sowing the seed. 'They had ploughs,' says the Rev. A. Dickson, 'with mould boards, and without mould boards, with and without coulters, with and without wheels, with broad and narrow pointed shares, and with shares, not only with sharp sides and points, but with high raised cutting tops.'—*Illus. of An. Professor Martyn* has given the figure of a modern Italian plough to illustrate Virgil's description. Rosier gives a figure of a Roman plough, which corresponds with those still used in the south of France. That used from time immemorial in Valencia, is supposed to come nearest to the common implement of the Romans, and consists of the following parts: 1. the buris, or head; 2. the temo, or beam; 3. the stiva, or handle; 4. the dentales, or share head; 5. the vomer, or share. The aura or mould board, and the culler or coulter, formed no part of the simple Roman plough. The plough staff, or paddle, was also a detached part. The manicula, which the ploughman took hold of, was a short bar fixed across; and to the draught pole the oxen were attached. The plough described by Virgil had a mould board, and was used for covering seed and ridging; but the common plough described above, instead of the mould board, required either a stick inserted in the share-head, or to be held obliquely. Circumvolving furrows, as employed by us, were not practised among the Romans; but the cattle returned in the same furrow.

119. In the Greek monuments of antiquity are four or five examples of wheel ploughs. Lassalle has given figures of these implements from Caylus's *Collection of Antiquities*, and from a Sicilian medal. He indeed imagines them to

have been invented about the time of Pliny, and attributes the invention to the Cisalpine Gauls; but Virgil evidently refers to such ploughs in his Georgics. The ligo appears to have been a spade, and the pala a shovel; they were both made of oak, shod with iron, or a blade entirely of iron. The urpex or ripex, was a plank with several teeth, used as our brake or cultivator, to break rough ground, tear up roots, &c. The crates was a kind of harrow, the rastrum a rake, the sarculum a hand-hoe, the marra an inferior hoe, the bidens a two-pronged hoe, used in vineyards, with a hammer at the other end to break the clods. The securis was an axe, although the same term was applied to the crescent-like blade of the pruning knife. Besides reaping hooks which resembled modern ones, they had invented a reaping machine, which appears to have resembled that used in Suffolk, for cropping the heads of clover left for seeds. Their threshing implements, and some for striking off the ears of corn, are imperfectly known.

120. The Romans did not bind their corn into sheaves, as was customary amongst the Jews, Egyptians, and Greeks. Threshing, for the most part, was performed in the open air, in a circular threshing-floor of forty or sixty feet diameter; where the corn being spread to the depth of one or two feet, was either trod out by the hoofs of cattle, or by means of a dragging machine. That used in the Carthaginian territory, consisted of rollers, studded with iron knobs, and furnished with a seat for the driver. Rods or flails were also occasionally employed. Corn was winnowed by throwing it from one side of the floor to the other, in the wind, by means of a shovel called ventilarium; but when the wind was inconsiderable, the fan was employed, (probably a kind of sieve.) After the corn was deposited, the straw, when not laid aside for litter, was sprinkled with brine, then dried, and rolled up in bundles, as provision for the oxen. Pasturing and harrowing corn were practised, when too luxuriant, as soon as the blades equalled the furrow. Fencing was carried only to a limited extent, and their other agricultural operations differ little from those of the ancients on the one hand, and the moderns on the other.

121. A great part of the Roman harvest appeared to depend upon fruits; figs, pears, &c. were grown in gardens and orchards, and the vine was supported by a row of elms or poplars, &c.

122. Of animals reared by the Romans, the most common sort were the quadrupeds now in use; besides these, they reared snails, dormice, bees, and fish. To the farmer's or bailiff's wife was committed the care of the poultry; which, besides those common amongst the moderns, included thrushes, larks, turtle doves, and peacocks; but it was chiefly Rome and Naples that were remarkable for rearing extensively the more delicate birds. In the time of the Cæsars, when Rome was in the zenith of her splendour, fat birds, as thrushes, and blackbirds, sold at two shillings each, although 5000 of them were frequently sold in a year from one farm. Pea fowls were sold at £1. 13s. 4d.; an egg was sold at 3s. 4d. Var. lib. iii. c. 2. A pair

of fine doves were commonly of the same price as a peacock; but, if very handsome, often sold as high as £8. 6s. 8d. I. Anius, a Roman knight, refused to sell a pair under £13. 6s. 8d. *Var. lib. iii. c. 7.* Fishes of certain species in the time of Varro, were so valued by the Romans that his friend Hortensius would rather have parted with a pair of his best coach mules than with a bearded mullet, *Var. lib. iii. c. 17,* and according to Pliny, *Nat. Hist. lib. ix. c. 55.* Hierrius's fish-ponds, from the quantity they contained, were sold for £33,333. 6s. 8d. and those of Lucullus at the same price, *Idem. lib. ix. c. 54.* One capital principle in all Roman agriculture was, ‘to sow less and plough better,’ since there is more gained by cultivating a small spot well, than a larger one indifferently. This they illustrated by many short sayings and stories. Pliny mentions a freed-man who made his vineyard produce crops so much larger than those of his neighbours, that they accused him of witchcraft, and accordingly brought him to trial. When he appeared in the forum, he produced a stout daughter, and some excellent implements, as iron spades, shears, &c. and presenting these, together with his oxen to the Senate, said, ‘these, Romans, are my charms.’ He was acquitted with honour. *Nat. Hist. lib. xviii. c. 6.* The following fact was also frequently advanced in favour of the above maxim. ‘A vine dresser had two daughters, and a vineyard. When his eldest daughter was married, he gave her one third of his vineyard for a portion; notwithstanding which, he had the same quantity of fruit as formerly. When his younger daughter was married, he gave her the half of what remained, and still the produce of his vineyard was not diminished.’ *Col. lib. iv. c. 3.*

123. The profits of Roman agriculture are difficult to be ascertained. The returns of seed mentioned by the ancients, are remarkable. St. Mark the evangelist speaks of seed sown on good ground, bringing forth, some thirty, some sixty, and others an hundred fold. Varro informs us that an hundred fold was reaped about Grenada, in Syria; and Byzantium, in Africa. From the latter place, Pliny informs us, Augustus received from his factor nearly 400 stalks, all of which originated in one single grain; and to Nero were sent 340 stalks produced in the same manner. In Italy itself the returns were not so great; good land in the time of Varro not producing more than ten, and in some places fifteen, for one; or about twenty-one and thirty-two bushels to an English acre; which, considering the popular ignorance as to chemistry, physiology, and other branches of natural philosophy, will not be thought inconsiderable.

124. Agriculture, it has been thought, derived little improvement from the Romans, and it does not satisfactorily appear that they advanced in this science beyond the Egyptians, Jews, Babylonians, and Greeks. Even what they knew, appears to have declined from the time of Varro to Pliny. The corruption and luxury of the period immediately succeeding the Christian æra, the civil wars at the end of the second century, the tyranny of the emperors in the third, and the removal of the seat of empire to Constan-

tinople in the middle of the fourth, prepared the way for the invasion of the Goths in the beginning of the fifth, when agriculture received a civil blight; swarms of intruders gathering upon the leaves and foldings of every useful science, withered the intellectual face of the empire; and all the arts, useful and ornamental, sunk to decay. The Romans had carried agriculture to considerable perfection in the several provinces of the empire. In Carthaginia, part of Spain, the south-east part of France, it had advanced nearly as far as Italy; because the Greeks, who flourished before the Romans, had planted colonies in Carthage and Marseilles. In Helvetia, Britain, and Germany, its advance was not so considerable; but at the fall of the Roman empire it began to decline generally in Spain and Africa, by the invasion of the Moors; in France, from the incursions of the Germans; in Britain, from the Saxons, Picts, and Scots; and in Germany, and Helvetia, from the predatory excursions in pursuit of which the inhabitants left their lands to the wild hand of nature.

125. Agriculture, however, did not perish, but amid the darkness of the middle ages, began gradually to emerge, and was seen through the dense atmosphere, like the morning star, glimmering upon the world, the peaceful harbinger of wealth and comfort.

126. In our own country the natives depended chiefly for their support upon flocks and herds, which the Saxons seized and pastured for their own use. Where cultivation was followed, especially in Wales, the people were not suffered to plough with horses, mares, or cows, but only with oxen, *Leges Walliae*, p. 228. No man might guide a plough who could not make one; and the ropes with which it was drawn were to be made of twisted willows: it was usual for six or eight persons to form themselves into a society, for fitting out one of these ploughs. The Anglo-Saxons, esteeming agriculture too ignoble for a warlike people, committed the cultivation of the earth to their women and slaves. The division of landed property into inlands and outlands, originated with the Saxon princes, who, after the distribution of conquered lands, denominated those parts contiguous to their respective residences, inlands, and let the outlands, or those which were more remote, to ceorls, or farmers. The rents were established by law. According to the laws of Ina, king of the West Saxons, at the beginning of the eighth century, the rent of a farm, consisting of ten hides, or plough-lands, was, ‘ten casks of honey, three hundred loaves of bread, twelve casks of strong ale, thirty casks of small ale, two oxen, ten wethers, ten geese, twenty hens, ten cheeses, one cask of butter, five salmon, twenty pounds of forage, and one hundred eels.’ *Wilkins, Leges Saxon*, p. 25.

127. A curious picture of a ploughman is found in Strutt’s work, entitled *Saxon Rarities of the Eighth Century*, which shews the rude and imperfect state of agriculture during that period. The invasion of Britain by the Normans tended greatly to the improvement of agriculture, by bringing over many thousands of cultivators

from the fertile plains of France and Normandy, who introduced their own methods. Richard de Ros, lord of Brunne and Deeping, and chamberlain to William the Conqueror, was in this a very effective instrument. The Norman clergy also practised agriculture; and Thomas à Becket, archbishop of Canterbury, used to go out with the monks frequently, and assist them in hay-making, reaping, &c.

128. IMPLEMENTS.—The implements in use at that period were nearly the same as those employed at present. Of the two species of ploughs then in common use, one appears from ancient pictures, which yet remain, to have been used for strong lands, and attended by an instrument in the right hand of the ploughman, for breaking the clods, &c. The other, without wheels, was used in light soils. The husbandry operations of this period are not very distinctly known. In the thirteenth and fourteenth centuries, the *Legum Angliae* of Judge Fortescue shews, that agriculture was carried on with vigour. In the fifteenth century, England was engaged in civil wars, and agriculture declined. The prelates, barons, and other great proprietors, nevertheless, kept extensive tracts of land round their castles, called demesne lands, which they cultivated by means of their villeins and hired servants. The dearths of Henry VII still further evince the low state of agriculture; for, in 1437—1438, wheat rose from 4s. or 4s. 6d. per quarter, to £1 6s. 8d. equivalent to £13 6s. 8d. of our money. In Scotland, cultivation was at a low ebb. In 1424 a law was passed, enacting, that every labourer of a simple estate should dig every day a piece of ground equal to seven square feet; and in 1457, it was enacted, that every farmer who had eight oxen should sow as follows—one firlot, or bushel of wheat, half a firlot of peas, and forty of beans; and in default should pay ten shillings to the baron, who, should he be deficient in the same with respect to his own lands, should pay the same sum to the king.

129. From the period of the accession of Henry VIII. in 1485, to nearly the middle of the eighth century, cultivation began to pour upon the kingdom all its numerous advantages. The culture of hops was introduced, and the breeding of horses was much encouraged. After the beginning of the sixteenth century, agriculture partook of the general improvement that followed upon the invention of printing.—The first book upon this subject in England, was The Book of Husbandry, published in 1534, by Sir A. Fitzherbert, judge of the Common Pleas. After some excellent observations, the propriety of which posterity have seen, he describes the advantage of ‘quycksetynge, dychynge, and hedgynge,’ and lays down a line of conduct ‘for a yonge gentylman that intendeth to thyryve,’ he afterwards points out the duty of a farmer’s wife, distasteful, certainly, to the wives of modern farmers, but applicable no doubt to the times in which he lived. He observes, ‘she is to make clothes for her husband and herself; and she may have the lockes of the shewe either to make blankettes, or coverlettes, or both.’ ‘It is a wife’s occupation,’ still further ‘to wynowe all manner of cornes, to make malte, to washe and wryng, to make hey,

shere corn, and in time of nede, to help her husbande to fyll the muckewayne or dounge carte, drive the ploughe, to load heye, corne, and suche other; and to go or ride to the market to sel butter, chese, mylke, eggis, chekyngs, capons, hennes, pygges, gese, and all manner of cornes.’ Many parts of this book have not been improved upon.

130. The state of agriculture, at this period, also receives additional illustration from the *Book of Surveying*, by the same author, published in 1539. ‘Four manner of commens’ are described; several sorts of mills, for corn and other purposes; and also ‘quernes that goo with hand;’ tenants of different orders, down to the ‘boundmen,’ who, he tells us, in some places ‘continue as yet,—and many tymes by colose thereof there be many freemen taken as bondmen, and their lands and goods is taken from them.’ In the conclusion of his work he gives directions ‘how to make a township that is worth xx marke a yere worth xx li a yere,’ viz. by enclosing, and having the closes or fields alternately cropped with corn and ‘let lye’ for some time. In the reign of Elizabeth agriculture greatly advanced, but was, according to Tussier, best understood in Essex and Suffolk. Harrison observed, *Description of England*, p. 188, a farmer ‘will think his gaines very small towrdes the end of his terme if he have not six or seven years rent lieing by him, therewith to purchase a new lease; besides a fine garnish of pewter on his cupboard, with as much more in odd vessels going about the house; three or four feather beds; so many coverlets and carpets of tapestric; a silver salt; a bowle for wine, if not a whole neast; and a dozen of spoones to furnish oute the suite.’ The condition of a yeoman, at that period, is also exemplified in the following case of bishop Latimer’s father. ‘My father,’ says Hugh Latimer, ‘was a yeoman, and had no land of his own, only he had a farm of three or four pounds by the year at the utmost, and hereupon he tilled so much as kept half-a-dozen men. He had a walk for a hundred sheep, and my mother milked thirty kine, &c. He kept his son at school till he went to the university, and maintained him there; he married his daughters with five pounds or twenty nobles a piece: he kept hospitality with his neighbours; and some alms he gave to the poor; and all this he did out of the said farm.’—*Gilpin’s Latimer*. Cattle were not plentiful, as appears from the exordium of an act passed in 1563, enacting that no person should eat flesh on the Wednesday and Friday in every week, under pain of forfeiting three pounds, cases of sickness and special licence excepted, neither of which even then extended to beef or veal. Harrison complains of the number of parks kept in the kingdom, of which he says, ‘there are not less than one hundred in Essex alone, where almost nothing is kept but a sorte of wilde and savage beasts, cherished for pleasure and delight,’ and ‘that if the world last a while after this rate, wheat and rie will be no graine for poore men to feed on.’—*Description of Britain*, p. 168.

131. Great attention was still devoted to the breed of horses. Henry VIII. from his predilec-

tion for splendid tournaments, at this time the passion of the age, had greatly encouraged the promotion of a particular species, of great strength and stature; which were indeed required to bear the weight of the complicated panoply, with which the knight and his courser were invested. Statutes were enacted for allotting to all parks a certain proportion of breeding mares, and enjoining not only nobles and prelates, but all persons whose wives wore velvet bonnets, to have stallions of a certain size for their saddle. The legal standard was fifteen hands in horses, and thirteen for mares; but it now became necessary to lower this standard in the counties of Huntingdon, Northampton, Cambridge, Lincoln, Suffolk, and Norfolk, to thirteen hands for stallions, and no stallion of less stature might be turned out on commons and forests, for fear of diminishing the breed. The English draught horses were also very powerful and of great size; five or six of them according to Harrison, being capable of drawing three thousand weight of the greatest tale for a long journey. Horses at that time, were so numerous in the kingdom, that Elizabeth, when she removed her residence, demanded a quota of 24,000 from the country, in the neighbourhood of her palace. *Descrip. Brit.* p. 220.

132. In the mean time the civil dissensions of Scotland, which continued nearly the whole of the sixteenth century, had almost crushed agricultural improvement in the bud; when the ecclesiastical land-holders were totally expelled, the calamities of the farmers increased, and the nature of their misfortunes may be guessed at, from the statutes enacted in their favour. *Stat. 110, Parl. 7, Jac. VI.* The first of these was to the purport, that all ‘slayers and houchers (oughers) of horses and other cattel,’ with their employers and maintainers, had ‘incurred the paine of death, and confiscation of all their gudes movvabil.’ A second act denounced the same penalty on all who maimed horses, oxen, or other cattle; also on those who cut or destroyed ploughs, or plough-peers, (in time of tilling) injured trees, corn, &c. *Stat. 83, Parl. 7, Jac. VI.* Other acts were framed for the protection of the farmer against petulant and obnoxious tithe gatherers, &c. The Scots, like the English, used every effort to improve their breed of horses; but so great was the jealousy of the two kingdoms, that it was made felony to export horses thither from England, lest they should improve their breed by our stallions. The Scottish government, about this period, condescended to consider the proper period for horses to be turned out to grass, so as most effectually to prevent the waste of corn; and, were pleased to enact, that all horses should be put to grass from May 15th, till October 15th, on pain to the owner of forfeiting each horse, or its value, to the king; gentlemen of 1000 marks yearly rent excepted. *Stat. 122, Parl. 7, Jac. VI.*

133. In England, the vine which had been formerly cultivated for wine, declined with the suppression of the monasteries; and was superseded by the more general cultivation of barley. Potatoes were introduced in this reign from Santa Fé, by captain Hawkins, about the year 1565; although

they did not come into general use for nearly two centuries afterwards. Several agricultural authors also flourished in this reign, particularly Thomas Tusser, born at Rivenhall, in Essex, in 1527, whose ‘Five Hundred Points of Husbandry,’ published in 1562, were recommended by lord Molesworth to be taught in schools. Barnaby Googe, a Lincolnshire gentleman, and Sir Hugh Platt; the Rev. W. Harrison, contemporary of Platt, and chaplain to Baron Cobham. This latter gentleman translated ‘Boethius’s History of Scotland,’ and wrote ‘A Description of England,’ in which he asserts, that the Spanish and Merino sheep were derived originally from this country.

134. In the seventeenth century many important improvements were introduced, particularly the cultivation of clover and turnips; for the adoption of which we are indebted to Sir Richard Weston, although the latter is commonly attributed to lord Viscount Townsend. The potatoe, Houghton describes ‘as a bacciferous herb, with esculent roots, bearing winged leaves and a bell flower.’ He observes, it was brought from Virginia, by sir Walter Raleigh, who planted some first in Ireland; afterwards, they were introduced into Lancashire, whence they began to spread all over the kingdom. When boiled or roasted, and eaten with butter and sugar, they form, says this author, a pleasant food. A sort brought from Spain of a larger form, (*convolvulus batatas*), more luscious than ours, he adds, are much set by, and sold for sixpence or eight-pence the pound. The chief writers of the seventeenth century were Weston, Hartlib, Blythe, Evelyn, Norden, Gabriel Platten, &c. The embankments, drainage of morasses, &c. the enclosures of land by act of parliament, and otherwise, together with the establishment of tolls in 1663, are to the honour of the period; and have tended, greatly, to advance the agricultural interests of this kingdom.

135. The agriculture of Scotland, during the fifteenth and sixteenth centuries considerably languished; the reformation of religion having taken the husbandry out of the hands of the monks, by whom alone it was practised upon correct principles, and placed it in the hands of men unskilled in the art of cultivation. In the seventeenth century the grounds in the south eastern countries were improved; but even then appeared in a wretched condition. Ray, who made a tour along the eastern coast in 1660, observed that fallow grounds were few; that the men were lazy, and frequently ploughed in their cloaks. The accession of James V. to the crown of England, was unfavourable to the agriculture of Scotland. The soldiers of Cromwell, who lay in Scotland for many years, and being mostly English yeoman, raised the low country districts into a higher state of improvement than had been known at any former period. The large fines exacted during the reign of Charles II. and his brother James, tended greatly to impoverish the proprietors and cultivators. Still, however, the laws passed in the seventeenth century paved the way for the present improved system. A Persian wheel, made by Worlidge, author of *Systema Agricultura*, capable of con-

veying water more than twenty feet high, for the watering of meadows, throws a light upon the advancement of irrigation. On the whole, from the imperfect glimmerings of the science, in this dark but interesting period, we may mark the dawn of those vast improvements which have since been effected upon our island.

136. The general progress of agriculture, from the revolution to the middle of the eighteenth century, was not so considerable as might have been expected from the exportation of corn; but the increase of population, and the wealth derived from manufactures, has at length augmented capital, and called forth a race of ingenious and enterprising cultivators. The inventions that have been introduced for increasing produce, and economizing labour, the garden-like appearance of the country, together with the passing of more than three thousand bills of enclosure, during the late reign, more effectually illustrate the state of British agriculture, than any thing verbal that could be advanced on the subject.

137. The shock sustained by the agriculturists since the peace of 1815, by the fall of prices, originating in the diminished circulation of money, was so severe, that many farmers lost all their capital, whilst others retained just enough to enable them to emigrate to other countries. The replies sent to the circulars of the 'Board of Agriculture,' exhibit a melancholy picture of the distress of cultivators generally. Rents are now, however, greatly lowered; and things begin to assume a more promising appearance. The rapid improvement of agriculture is shown by nothing more clearly than the organization of agricultural societies, in nearly all the counties of the kingdom; among which the Bath and West of England Society, in 1777; and the Highland Society of Scotland, in 1784, are the most important. The benefits of these institutions have never been appreciated, whether we look to those which are nearer or more remote. In their own immediate firmaments, they are the most distinguished orbs—shining upon surrounding institutions, and pouring light, warmth, and fertility upon our native island. The Agricultural Board ceased in 1819, being thought no longer necessary; but the effects produced by these institutions yet remain, and shall remain, when the original founders of them are forgotten, to ameliorate the state of man—to fulfil the great command—to imitate the Father of Lights—to pour their broad blessings on the earth; and when the clouds which overcast the southern hemisphere shall have cleared away, their instructions, like the rays of the sun, shall travel over the blue ocean wave, and dawn upon the unenlightened Indian, and semi-civilized Hindostanee. Professorships of this science have been established in Edinburgh, and several continental universities; and are in contemplation for those of Oxford and Cambridge.

138. We cannot close the present article without a few observations on the general state and distresses of Ireland with regard to agriculture. The primary cause of suffering amongst the Irish is ascribed by Young, and other writers, to the redundancy of population, which in 1791 amounted to 4,200,000, and has been ever since increasing at

the rate of one forty-sixth part per annum. The state of the people generally, is certainly that of extreme indigence, as must be the case in every country where the increase of its inhabitants exceeds the progress of its wealth and industry. Their houses, furniture, clothing, provisions, in short, every thing relating to domestic economy, fully elucidate the above observation. The lower classes have no conception of the comforts of life, which even if they knew how to appreciate, they have not the means of obtaining. The absolute necessities of life are, however, supplied by the superabundant cultivation of potatoes, which except in years of extraordinary calamity, have rarely been known to fail. To this is, in a great measure, attributed that deep-rooted indolence, which forms the prominent characteristic of the people. Their wants limited to the mere sustenance of animal life without its comforts, destroy the sources of artificial desire; and the usual mode in which the labourers are paid, viz. by giving them a piece of potatoe land by the year, whilst it supplies the cravings of animal necessity, neutralizes every collateral principle which would propel them to exertion. After the plantation of the esculent vegetable above-nominated, the Irish peasant has little to do till the digging season approach; and during the apyrexia intervening between these troublesome seasons, acquires those idle habits which the subsequent transfer to a more regular employment is unable to eradicate. It is indeed remarkable, that Ireland, circumflowed by the same ocean whose warm vapours prove so refreshing to England—under the same genial diversity of climate—in the same average latitude—possessing a soil so singularly prolific, as to be able with little labour and manure to yield an alternate crop of wheat and potatoes for ever, combined with the natural advantages of mineralogy, and facilities for manufacture and commerce, should remain for so many centuries in a state of almost absolute barbarism, while the contiguous parent isle is increasing in wealth, advancing in magnificence, and flourishing in all the useful arts that civilize and polish human life.

139. We would, in conclusion, entreat our readers of other pursuits and professions, not to look with jealousy on the space now devoted, or which we shall continue to devote to the important topics of this paper. 'Though mines of gold and silver, (says Dr. Johnson in one of his minor pieces) should be exhausted, and the species made of them lost; though diamonds and pearls should remain concealed in the bowels of the earth, and the womb of the sea; though commerce with strangers be prohibited; though all arts, which have no other object than splendour and embellishment, should be abolished; yet the fertility of the earth alone would afford an abundant supply for the occasions of an industrious people, by furnishing subsistence for them, and such armies as should be mustered in their defence. We, therefore, ought not to be surprised that agriculture was in so much honour among the ancients; for it ought rather to seem wonderful that it should ever cease to be so, and that the most necessary and most indispensable of all professions should have

fallen into any contempt.' (*Works*, v. ii. p. 384, 5.) The same excellent writer has noticed the extraordinary demand for books on agriculture under the peaceful sway of James I. 'It deserves to be remarked,' he observes, 'because it is not generally known, that the treatises of husbandry and agriculture which were published about that time are so numerous, that it can scarcely be imagined by whom they were written, or to whom they were sold.' (*Origin and Importance of Fugitive Pieces, Johnson's Works*, v. xi. p. 191.) On which an able contemporary thus comments—'Nothing can illustrate more strongly the effects of a pacific system of policy, in encouraging a general taste for reading, as well as an active spirit of improvement. At all times, and in every

country, the extensive sale of books on agriculture, may be regarded as one of the most pleasing symptoms of mental cultivation in the body of the people.'

140. These (1826) are times of peace: statesmen are more willing to learn how to govern mankind in times of peace than formerly, and seem sincerely directing their attention to every commercial topic. Let *them* not neglect agriculture; let the laws connected with it engage that share of parliamentary and general consideration which their importance demands; let commercial men sympathize with the peculiar burdens of agriculturalists; and let the agriculturalist consider his own true interests best pursued in conjunction with those of the entire country.

AGRICULTURE, BOARDS and SOCIETIES, for the ENCOURAGEMENT of. The first society for the promotion of agriculture in the British isles, of whose history we have any account, was *The Society of Improvers in the Knowledge of Agriculture in Scotland*, instituted in 1723. This association exerted itself with considerable success, in introducing cultivated herbage and turnips, and improving on former modes of culture. The earl of Stair, one of its active early members, is said to have been the first who cultivated turnips in that country. But the example appeared to have little effect upon the practice of the common tenantry. Maxwell, who for one or two sessions, delivered lectures on agriculture, at Edinburgh, gives the first notice of a threshing machine, in his *Transactions of the Society of Improvers*. It appears to have been invented by Michael Menzies, advocate, who obtained a patent for it; and, according to the report of the above society, one man by the assistance of this machine, might do the work of six. One of the machines was 'moved by a great water-wheel and treddles'; and another, 'by a wheel of three feet diameter, moved by a small quantity of water.' See *Encyc. Brit. and Ed. Encyc. Art. Agr.* and Brown's *Rural Affairs*. Draining, inclosing, summer-fallowing, sowing flax, hemp, grass seeds, turnip and rape, planting cabbages after, and potatoes with, the plough, in large fields, were now introduced; and more corn was grown, where it was never known to grow before, by one sixth of the former produce of the kingdom. Hope, of Rankeillor, a member of this society, among other patriotic exertions, drained the morass, near Edinburgh, formerly known as Straiton's Loch; and projected the walks over the grounds now known as *the meadow walks*, for some time a fashionable place of resort. Cockburn, of Ormiston, was a principal member and founder of this institution; and, the dukes of Hamilton, and Athol, Hopeton, and Islay, exerted themselves to facilitate the objects of this society. At length, this excellent institution, at one time consisting of more than 300 members, became neglected, and was dissolved, after about twenty years of valuable services to Scotland.

The establishment of the Dublin Agricultural Society, in 1749, gave a stimulus to agriculture in Ireland. Its origin may be traced as early as 1731; when Prior, of Rathdowney, Queen's County, and a number of other gentlemen, associated themselves for the improvement of agriculture and husbandry. In 1749, Prior, by means of the lord lieutenant, procured a grant of £10,000 per annum, from the Irish government, in aid of so desirable an object. Miss Plumtree considers this the first association of the kind, formed within the British dominions; but, we have seen that the Agricultural Society of Edinburgh was organized in 1723.

COUNTY SOCIETIES, for the promotion of agriculture, which multiplied in every direction during the eighteenth century, evince the interest attached to that pursuit in England. Among them, the highest rank may certainly be claimed for the *Bath and West of England*, established in 1777, and the *Highland Society of Scotland*,

founded in 1793. The *Agricultural Reports* of the different counties, many of them surveyed a second time, exhibit great ability, and have been followed by a *General Report of the Agricultural State and Political circumstances of Scotland*, of considerable value. Many of these county societies were in operation prior to the existence of the *Board of Agriculture*, and contributed to prepare the public mind for that national institution.

THE LONDON BOARD OF AGRICULTURE, was established by act of Parliament, 17th May, 1793, and constituted by royal charter, 22d of August following, for the encouragement of Agriculture and Internal Improvement. 'The circumstances,' says Sir J. Sinclair, the president and founder of this excellent institution, 'which led to the establishment of a board, so likely to be of material service both to this country and to society at large, cannot fail to be interesting to the public.' 'In 1786,' this gentleman informs us, 'he undertook an extensive journey through the most interesting parts of Europe, to obtain political information, to ascertain the state of other countries, and to discover every means which had been sanctioned by the experience of other nations, that could be successfully introduced for the improvement of Great Britain.' that, 'in the course of that tour,' in which he travelled 7500 miles in seven months and a half, 'he became acquainted with the most distinguished authors, the ablest statesmen, and the most zealous patriots, that Europe could then boast.' and 'returned full of ardour, to establish, in his own country, the beneficial institutions, which were scattered over others; and to make this island the centre of the various improvements of which political society was capable, more especially those of an agricultural nature.' Circumstances, however, having occasioned a coldness with the minister, he found that any attempt, to carry such measures into effect, was not likely to be successful in parliament, and thence he was under the necessity of waiting for a more favourable opportunity.' Sir John Sinclair adds, that having published his History of the Revenue, which he had intended to have concluded with a chapter on the political circumstances of the country; he then saw the necessity of forming some institution for the express purpose of collecting statistical information, the public having felt the most serious inconveniences and losses, from information of that nature not being any where to be obtained. This suggested the idea of beginning that useful and extensive work, the Statistical account of Scotland, concluded in 21 vols. 8vo. and to the completion of which 900 individuals of intelligence and ability contributed their assistance. About the same time, Sir John, having received information respecting the celebrated wool of the Shetland isles, and of the dangers to which their flocks were exposed, was led to lay a statement of these facts before the Highland Society, who gave every assistance in their power, and to suggest the erection of a new Society, entitled the British Wool Society, for the special purpose of improving British wool. The business of that Society was carried on with such

energy and success, that in the summer of 1792, ‘the greater part of this island had been surveyed, by persons skilled in the management of sheep, whose observations were circulated over the kingdom.’ It was in the preface to an account published by that Society of one of these tours, that Sir John first hinted at the establishment of a Board of Agriculture. After stating that ‘they had established many important facts; that they had proved that the finest breeds of Spain or of England will thrive on the wildest of the Cheviot hills, and that very fine woollen breeds may be propagated in the most mountainous districts of Scotland,’ he adds, ‘but unless a Board of Agriculture be constituted, for the purpose of superintending the improvements of the sheep and wool of the country, and other objects connected, either with the cultivation or pasture of the soil, he should despair of any considerable success in those pursuits.’ Impressed with these ideas, Sir John Sinclair went to London in December 1792, resolving to attempt the establishment of such a Board.

On the 15th of May, 1793, this gentleman made his motion in parliament for this purpose, ‘It is supposed,’ said he, ‘that there are sixty-seven millions of acres in Britain, of which seven millions are occupied with houses, roads, rivers, lakes, &c. There remained sixty millions, of which five millions only were employed in raising grain; twenty-five millions were appropriated to pasture, and there remained thirty millions either completely waste, or under a very defective system of husbandry. That was an object of astonishing importance. Disgraceful, indeed it was, that nearly one half of the kingdom, which might furnish subsistence to above ten millions of people, should remain in such a state.’ By the efforts of the proposed institution, he considered the stock of the farmer might be rendered infinitely more valuable, without requiring a greater quantity of food, or any additional care or expense.’ The additional value of black cattle, of which it is supposed there are five millions in the island, he estimated, at 20s. a head, would add five millions per annum to the national wealth. There are at least twenty millions of sheep in Britain. By improving the fleece, 1s. per sheep might be added to the value of the wool, which would produce one million: the manufacturer of the wool can treble the value; hence an addition of other five millions per annum; and the profits arising from improving the carcase would be still more considerable. Great improvements might also be made in other kinds of stock. Great savings would arise by the use of improved instruments of husbandry, while by following judicious systems adapted to the different soils, ground would be cultivated at much less expence and with greater advantage. These improvements would furnish the means of healthful occupations to many thousands, almost millions of people, who, from the integrity of their private conduct, and the vigour of their constitutions, should as much as possible be multiplied.’ To secure these advantages a Board of Agriculture was absolutely necessary, 1. As a general magazine for agricultural knowledge. 2. As the best means of collecting

and circulating that knowledge, and exciting a spirit of experiment. 3. As the most certain method of establishing an extensive foreign correspondence, to procure the most speedy information of agricultural improvements and discoveries, in all quarters of the globe. 4. As a public body, capable of being entrusted with the privilege of franking, to render its correspondence less expensive. 5. As the only medium, through which any general improvement of stock could be expected, the authority and influence of a public board far surpassing the exertions of private societies, however active, in removing deep-rooted prejudices, and concentrating the knowledge of many individuals of different professions. And, 6. As the best means of obtaining a statistical account of England, and giving a view of the real state of that country; such as had already been nearly completed in Scotland, and which might soon be universally followed in other countries: ‘And thus the principles of political society, and the sources of national improvement, would be more completely ascertained, than in any former period of history.’ For when persons talked with raptures of the great wealth brought into this country by commerce, they did not consider that the nation lost as much by neglecting agriculture, as they gained by commerce. The Board was finally appointed to consist of a president, treasurer, secretary, under-secretary, two or more surveyors, one or more clerks, with such other officers as may be necessary, and thirty ordinary members: besides the archbishops of Canterbury and York, the lord chancellor, or lord keeper of the great seal, lord president, lord privy seal, lord treasurer, or first commissioner of the Treasury, lord high admiral, or first lord commissioner of the admiralty, the bishops of London and Durham, the two secretaries of state, the master of ordnance, the speaker of the house of commons, the president of the Royal Society, the surveyor general of woods and forests, and the surveyor of the crown lands, for the time being; who are all members *ex officio*. The annual election of officers and members was appointed for the 25th of March, when five of the ordinary members were to go out, and five others to be chosen. At all meetings of the Board, seven should be a quorum for doing business, the president or the deputy being always one: and the number of honorary members to be unlimited.

At first Sir J. Sinclair’s friends had little hopes of his success, and when he informed Mr A. Young, that he had an appointment with Mr Pitt to explain the advantages of the measure, Mr. Young wrote, ‘When you come from Mr. Pitt, I shall have won the wager, (that he would not succeed.) Pray don’t give ministers more credit than they deserve. In manufactures and commerce, you may bet securely, but they never did, and never will do any thing for the plough. Your board will be a Board in the Moon.’ Sir John, however, took every prudent measure to insure success. M. Dundas early promised his assistance, notwithstanding their political differences; and Mr. Pitt assured him, ‘that he would not oppose the measure, but that his support would depend on what he judged was the

sense of the house.' To satisfy the house of the beneficial tendency of such a measure, Sir John, previous to his motion in parliament, circulated a printed paper among the members, containing a plan of the board, its objects, advantages, and probable expenses. Still, however, a few members, suspecting some scheme of corruption or ministerial influence to be at the bottom, opposed it vehemently; but it was carried by a majority of seventy-five; 101 voting for it and twenty-six against it. Mr. Sheridan and others, who then opposed it, have since very handsomely expressed their conviction of the utility of the measure, and their wishes for its success. The board was established by Act of Parliament, on the 17th May 1793, £3000 per annum voted for its support, and the charter drawn up and ultimately sanctioned by the Great Seal, on the 23rd of August, although the high fees paid for it, which amounted to no less than £1189. 12s. 2d. might, one would think, have expedited the business more quickly. The board could not be assembled till the 4th of September, and the regular meetings did not commence till January 23rd, 1794. One of the first objects of their attention was to collect materials for a statistical account of England. Accordingly specimens of parochial reports were printed, with a view of rousing the clergy of the church of England to exertions similar to those of their brethren in Scotland. But it was afterwards thought proper on various accounts, to prefer general to particular enquiries, and to procure county instead of parochial reports. Accordingly surveys were made and reports printed of the state of agriculture, in all the counties of the United Kingdoms: and many gentlemen employed, executing their tasks gratis. The charge of collecting this mass of information, and surveying the whole island, did not exceed the sum of £2170. The expense of printing the reports, however, was great. As a specimen of the expedition with which the business of the board was carried on, it is worth mentioning, that no fewer than seventy-four of these reports were given in, and either printed or in the press, within little more than six months after its second meeting; that during the first session above 80,000 papers were printed and circulated, of which above 100 were returned with valuable hints and observations written in the margins, before the 29th of July, 1794; and that by the end of the second session, the survey of the whole kingdom had been nearly completed, and the reprinting of some of the reports had actually commenced. Such a quantity of important business, begun and executed within so short a period, we are persuaded is not to be found paralleled in the annals of any public society. Nor were these the only exertions made by the board within that period. Through their recommendation and influence extraordinary merit was rewarded, £1000 being granted by parliament, to Mr. Joseph Elkington, who had carried the art of draining land to a degree of perfection hitherto unknown; and the interests of a most useful class of the community, viz. the common labourers, had been attended to, by introducing and passing the 'act for the more effectual prevention of the use of

defective weights, and false and unequal balances.' And there is every reason to believe, that in consequence of the recommendations of the board, in January, 1795, 50,000 additional acres were planted with potatoes, and a famine, consequently, prevented by thus providing six months provisions for about a million of people. The crop of wheat in 1795, however, proving defective, the president recommended to the board, an extra cultivation of that necessary grain, in a letter which was sent to all the members, and to the quarter sessions of the counties, as well as inserted in fifty different newspapers, in consequence whereof a greater quantity of wheat was sown, and, with the advantage of a favourable season, a more productive and plentiful crop was reaped in autumn 1796, than perhaps at any former period in the annals of British agriculture.

We should protract this article beyond all bounds, were we to enumerate all the objects of this truly patriotic institution. We shall, therefore, after giving the great outlines of investigation, as stated by Sir J. Sinclair to the board, in his 'General View of the Inquiries essential for the internal improvement of the kingdom,' only mention one or two important objects of their attention. The former are thus ranked by the president. 1. The riches to be obtained from the surface of the national territory. 2. The mineral or subterraneous treasures of which the country is possessed. 3. The wealth to be derived from its streams, rivers, canals, inland navigations, coasts and fisheries; and 4. The means of promoting the improvement of the people in regard to their health, industry, and morals, founded on a statistical survey of every parochial district in the kingdom, and the circumstances of its inhabitants. Under one or other of these heads, every point of real importance, that can tend to promote the general happiness of a great nation, seems to be included. Three objects of attention were pointed out—

1. To ameliorate the condition of the lower orders of the people, by promoting improvements in the construction of cottages, and ascertaining the means of lessening the consumption of fuel.
2. To recommend the annexing of a large garden to each cottage; and,
3. To encourage the extension of friendly societies. Another important object of the board was, to procure an act for the enclosure and cultivation of the waste lands in Great Britain: and thus to

—Cut off those legal bars

Which crush the culture of our fruitful isle.

In a word, the great objects of the board were to collect and condense every particle of information, that could be interesting either to individuals or society.

In his address to the board, 24th of May, 1796, Sir John Sinclair justly observes, 'that a single additional acre, cultivated at home, is more truly valuable than the most extensive possessions acquired abroad, at an enormous expense of treasure and of blood, and retained with difficulty and danger.' And in a former address, on the 29th July, 1794, after stating that the probable addition to the national capital by the improvement of 22,351,000 acres of waste lands

would amount at thirty years purchase to £905,215,500; besides £30,193,850 of additional national income. He allows an objection may be urged, that the improvement of these 22,351,000 acres at £4 per acre would occasion an expense of £89,404,000. To this, after replying, that 'in a national account this expense is no object;—that the public, instead of losing, gains by the expenditure; and that the money thus laid out might have lain dormant; might have been wasted, or destined for the cultivation of distant territories, with all the risk of being taken by an enemy, &c.', he adds—'That here it is impossible not to advert to the astonishing difference between spending eighty-nine millions in improvements at home, or in foreign conquest. After the expenditure of that sum in war, it would be accounted a most fortunate means of reimbursement, if we could secure any territory, by a commercial intercourse with which, five millions per annum could be gained; whilst, at the same time, it would be necessary to pay at least five millions of additional taxes. But if that money were laid out at home, or rather, if individuals were encouraged to expend a part of their wealth, in the internal improvement of the country, instead of new taxes being necessary, the old ones would become lighter and more easily paid; and instead of dragging £5,000,000 per ann. from an enormous distance, with much risk and expense, thirty millions would be produced within our own domain, and always at our command.' Sir John Sinclair closes his account of the board, with this philanthropic proposal, that a 'Plan of an agreement be entered into among the powers of Europe and the United States of America, for rewarding discoveries of general benefit to society.' The general outlines are, 'that each power should agree to pay a sum according to its revenue, for rewarding those who make any useful discovery in rural economy, medicine, or the arts; and that such discoveries should be rapidly extended to the different countries; and brought to their ultimate state of perfection. The attention of mankind being thus directed to such objects, it is impossible to say, to what perfection the arts necessary for their comfort and sustenance might be carried. The desire for fame and emolument, and the emulation of many nations rivalling each other in such arts, would produce discoveries, the importance of which can hardly be estimated. And such an undertaking might have the effect of rendering wars less frequent and ferocious.' He concludes, 'If the measures above hinted at were adopted, a new scene in politics might be the happy consequence, and rulers of nations might in future boast,—not of their numerous fleets,—not of their gallant armies,—not of extended commerce,—of splendid or luxurious arts, or acquisitions by intrigue or conquest,—but of this,—that within their respective dominions, a greater number of human beings enjoyed all the blessings of political society, in greater perfection, than hitherto they had ever been enabled to attain in any former period of history.'

We have dwelt thus long on the formation and history of a society, now in fact, extinct, (for in 1819, the usual parliamentary vote for its

support, was withdrawn,) because, with some little prolixity, important agricultural details are included in it: and as a tribute of respect to the unwearied and public-spirited exertions of more than one excellent individual.

AGRIEL/EA, in botany, the wild olive.

AGRIFOLIUM, or **AQUIFOLIUM**, in botany. See **ILEX** and **HOLLY**.

AGRIGAN. See **AGRIGNAN**.

AGRIGENTUM, **AGRAGAS**, or **ACRAGAS**, in ancient geography, a celebrated city on the southern shore of Sicily, the site of which is now partially occupied by the town of Girgenti. The ancient name (Acragas) was also that of a neighbouring stream; and both, according to Polybius, were so called (*αργαν*) from the fertility of the surrounding country. The situation of this city was peculiarly strong and imposing, chiefly standing on a bare and precipitous rock, elevated 1100 feet above the level of the sea. Mr. Swinburne and M. Houelle contend that a considerable part of the ruins reach into the vale. It was protected on the southern side by the river Acragas, and on the western, by the Hypsas. A strong wall was erected along the margin of the rock, and in the eastern part of the town, on the site now occupied by Girgenti, was placed the citadel of Cocalus, so environed by a deep gulph, as to be approachable only by a single narrow path.

Dedalus, the most famous mechanic of fabulous antiquity, fled to this spot for protection against Minos, and built many splendid edifices for Cocalus, king of the island. Long after his flight, A. A. C. 600, the people of Gela sent a colony hither. These Greeks converted the ancient abode of the Siculi into a citadel, to guard the magnificent city, which they erected on the hillocks below. An advantageous situation, a free government, with all its happy effects, exalted their commonwealth to a degree of riches and power, unknown to the Greek settlements, Syracuse alone excepted.

To its advantages as a place of great strength, the city added others of a commercial nature being within two miles and a half of the sea, by which an easy intercourse was afforded with the ports of Africa, and the south of Europe. The soil about Agrigentum being very fertile, was laid out chiefly in olive yards, the products of which were carried to Carthage, and brought immense wealth to the cultivators. This enabled them so splendidly to adorn the city with temples and other public works, that Polybius, l. ix. says, it surpassed in grandeur of appearance most of its contemporaries. Among the more important of its buildings, were the temples of Minerva, and of Jupiter Atabyris, (who was worshipped under this appellation in the island of Rhodes,) built on the highest ground in the city; and the temples of Jupiter Olympius, and of Hercules.

The temple of Jupiter Olympius, which vied, in size and grandeur of design, with the finest edifices of Greece, is said by Diodorus Sic. l. xiii. to have been 340 feet long, sixty broad, and 120 high, the foundation not being included, which was itself remarkable for the immense arches

upon which it stood ; the walls of the building had half-columns let into them, measuring twenty feet round on the outside, and flutings of depth sufficient to allow a man to stand in them. The porticos were very grand ; the eastern representing, in admirable sculpture, the battles of the giants ; and the western the siege of Troy. A war prevented the completion of this temple, when the roof only remained unfinished. There was also an artificial lake, cut out of the solid rock, near the city, of about a mile in circuit, and thirty feet deep, from which fish were obtained in abundance for the public feasts, and which was rendered an object of pleasure to the citizens, by the number of swans and other water-fowl which frequented it. But the mud being suffered to accumulate in this basin, it was at length filled up, and vines being planted, it became a remarkably fruitful spot. This lake, and the temple just described, were the work of a number of Carthaginian captives, by whose labour were also built the public sewers, which were objects of admiration for their strength and size.

The inhabitants of Agrigentum were enfeebled by luxury and pleasure. Empedocles, as Diogenes Laertius informs us, l. 8. seg. 63. tome i. p. 532. ed. *Meibom*, reproached them ‘with devoting themselves every day to pleasure as if they were to die on the morrow, and yet building houses as if they were to live for ever.’ They are, however, commended for their hospitality. Gellias, a rich citizen, is particularized by historians for his practice of setting porters at his gate for the purpose of inviting strangers to refresh themselves in his house. On one occasion, when 590 horsemen applied to him for a lodging, they were all liberally entertained, and furnished during their stay with garments from his wardrobe. The Agrigentines were famous for their attention to the breeding of horses, *Virgil*, *AEn.* l. iii. v. 705 ; and as an instance of their possessions in this way, Diodorus relates, that when a native had been crowned victor at the Olympic games, he was brought into the city with great pomp, attended by 300 chariots, each drawn by a pair of white horses, the property of the citizens.

With respect to the early history of this ancient city, and even its founders, much obscurity prevails. Strabo calls it an Ionian colony. Polybius says its first inhabitants were Rhodians. Thucydides, in his sixth book, relates that the Geloi, who were of Rhodian origin, built this city after having been about 100 years in Sicily. Some fabulous accounts even assign its erection to Daedalus, whose flight to this place we have already noticed.

In the early period of their history the Agrigentines were formidable for their military enterprizes. In the fifty-second Olympiad, B. C. 571, the cruel Phalaris, whose name and brazen bull are familiar to most of our readers, usurped the sovereignty ; but after a reign of sixteen years shared the common fate of tyrants, and is supposed to have been put to death in his own bull. After his death, the people are said to have enjoyed their liberty about fifty years ; when Thero, a second usurper, ascended the throne ; who, by his justice, moderation, and valour, re-

conciled the people to the obscurity of his origin. He joined his son-in-law Gelo, king of Syracuse, in a war against the Carthaginians ; in the course of which, victory attended all his steps, and Sicily saw herself for a time delivered from her African oppressors. Soon after his decease, his son Thrasydeus was deposed, and the old democratical government restored. Ducetius next disturbed the general tranquillity. He was a chief of the mountaineers, descendants of the Siculi ; and was an overmatch for the Agrigentines, while they were unsupported by alliances, but sank under the weight of their union with the Syracusans. Some trifling differences dissolved this union, and produced a war, in which the Agrigentines were worsted, and compelled to submit to humiliating terms of peace. Resentment led them to embrace with joy the proposals of the Athenians, then meditating an attack upon Syracuse. Their new friends, however, soon made them feel, that the sacrifice of liberty and fortune would be the price of their protection ; and this consideration brought them speedily back to their old connections. But this reconciliation and its effects drew upon them the anger of the Carthaginians, by whom their armies were routed, their city taken, their race almost extirpated, and scarce a vestige of magnificence was left. Hannibal opened his campaign with the siege of this city, which lasted eight months. Many of the inhabitants removed during its continuance, and went to Gela ; those who remained were, by the orders of Himilcon, committed to the sword, and the riches of a city, containing 200,000 inhabitants, plundered by the conquerors.

Agrigentum lay fifty years buried under its own ruins ; when Timoleon, after triumphing over the Carthaginians, and restoring liberty to Sicily, collected the descendants of the Agrigentines, and sent them to re-establish the dwellings of their forefathers. Their exertions were rewarded with astonishing success ; for Agrigentum rose from its ashes with such a renewal of vigour, that in a very short time we find it seizing a happy moment, when Agathocles and Carthage had reduced Syracuse to the lowest ebb, and arrogating to itself supremacy over all the Sicilian republics. Xenodicus was appointed the leader of this arduous enterprise ; and had his latter operations been as fortunate as his first campaign, Agrigentum would have acquired such a preponderance of reputation and power, that the rival states would not even have dared to attack it. But a few brilliant exploits were succeeded by a severe overthrow, and the Agrigentines were obliged to sue for peace to Agathocles. This commonwealth afterwards took part with Pyrrhus, king of Epirus, in his attempt upon Italy ; and when he left Sicily to the mercy of her enemies, threw itself into the arms of Carthage. During the first Punic war, Agrigentum was the head-quarters of the Carthaginians, and was besieged by the Roman consuls, who after eight months’ blockade, took it by storm, about the year B. C. 198. The chiefs of the Agrigentines were, by order of the consul Lævinius, first scourged with rods, and then beheaded. The common people were made slaves, and sold to

the best bidder. The spoils of the city were put up to sale, and the money returned to the public treasury. *Livy*, lib. xxvi. c. 40. tom. iii. p. 1138. ed. Drakenb. *Polybius*, lib. i. p. 15—19. After this period, Agrigentum is seldom mentioned in history; nor is it easy to ascertain the precise time of the destruction of the old city, and the building of the new one.

The further history of this famous place, may be reduced within a very short compass. From the best information, it appears that the inhabitants, or at least all that escaped the Roman severity, still adhered to their noble walls. The citadel still remained upon the mountain of Cocalus; every requisite for defence, pleasure, and comfort of life still surrounded them; a natural wall, formed by abrupt rocks, presented a strong barrier against assailants; pleasant hills sheltered them on three sides without impeding the circulation of air; before them a broad plain, watered by the Acrages, gave admittance to the sea-breeze, and to a fine prospect of that element; the port, Emporium Agrigentinorum, lay in view at the mouth of the river, and probably the road across the flat was lined with populous suburbs. Often, by means of its commerce, the commonwealth was long able to resist the shocks of adversity, and to rise again with fresh splendour. It was, however, crushed in the general fall of Grecian liberty; and the feeble remnants of its population were at length driven out of its walls by the Saracens.

The present town of Girgenti occupies the mountain on which the ancient citadel stood. At the north-east angle of the old limits, upon some foundations of large regular stones, a church has been erected; a road appears hewn in the solid rock for the convenience of the votaries that visited this temple in ancient days. It was then dedicated to Ceres and her daughter Proserpine, the peculiar patronesses of Sicily. Bishop Blaise has succeeded to their honours.—At the south-east corner, where the ground, rising gradually, ends in a bold eminence, which is crowned with majestic columns, are the ruins of a temple said to have been consecrated to Juno. To the west of this, stands the building commonly called the Temple of Concord; the stone of which, and the other buildings, is the same as that of the neighbouring mountains and cliffs, a conglutination of sea-sand and shells, full of perforations, of a hard and durable texture, and a deep reddish brown colour. The Doric temple has many of its columns, entablature, pediments, and walls, entire; only part of the roof is wanting. It owes its preservation to the piety of some Christians, who have covered half the nave, and converted it into a church, consecrated under the invocation of St. Gregory, bishop of Girgenti. In the same direction are rows of sepulchres cut in the rock. Some masses of it are hewn into the shape of coffins; others drilled full of small square holes employed in a different mode of interment, and serving as receptacles of urns. One ponderous piece of it lies in an extraordinary position; by the failure of its foundation, or the shock of an earthquake it has been loosened from the general quarry, and rolled down the declivity,

VOL. I.

where it remains supine, with the cavities turned upwards. Only a single column marks the confused heap of moss-grown ruins belonging to the temple of Hercules. It stood on a projecting rock above a chasm in the ridge, which was cut through for a passage to the port. In the same tract over some hills, is situated the Tomb of Thero. It is surrounded by aged olive-trees, which cast a wild irregular shade over the ruin. The edifice inclines to the pyramidal shape, and consists at present of a triple plinth, and a base supporting a square pedestal: upon this plain solid foundation is raised a second order, having a window in each front, and at each angle two Ionic pilasters crowned with an entablature of the Doric order. Its inside is divided into a vault, a ground room, and one in the Ionic story, communicating with each other by means of a small internal staircase. In the plain are seen the fragments of the temple of Æsculapius; part of two columns, and two pilasters, with an intermediate wall, support the end of a farm house, and were probably the front of the cells. Towards the west, are the gigantic remains of the temple of Jupiter Olympus, minutely described by Diodorus Siculus. It may literally be said that it has not one stone left upon another; and it is barely possible, with the help of much conjecture, to discover the traces of its plan and dimensions. Diodorus calls it the largest temple in the whole island: but adds, that the calamities of war caused the work to be abandoned before the roof could be put on; and, that the Agrigentines were ever after reduced to such a state of poverty and dependence, that they never had it in their power to finish this superb monument of the taste and opulence of their ancestors. The length of this temple was 370 Greek feet; its breadth, sixty; and its height 120, exclusive of the foundations: the extent and solidity of its vaults and underworks, its spacious porticoes, and exquisite sculpture, were suited to the grandeur of the whole.—The next ruin belongs to the temple of Castor and Pollux; vegetation has covered the lower parts of the building, and only a few fragments of columns appear between the vines. This was the point of the hill where the wall stopt on the brink of a large fish pond, spoken of by Diodorus: it was cut in the solid rock thirty feet deep, and water was conveyed to it from the hills. In it were bred a great quantity of fish, for the use of public entertainments; swans, and various other kinds of wild fowl, swam along its surface, for the amusement of the citizens; and the great depth of water prevented an enemy from surprising the town on that side. It is now dry, and used as a garden. On the opposite bank are two tapering columns, without their capitals, placed in a tuft of carob trees. Monte Toro, where Hanno encamped with the Carthaginian army, before the Roman consuls drew him into an engagement that ruined his defensive plan, is a noble back ground to this picturesque group of objects.—The whole space, comprehended within the walls of this ancient city, abounds with traces of antiquity; foundations, brick arches, and little channels for the conveyance of water; but in no part are any

2 A

ruins that can be presumed to have belonged to places of public entertainment. This is the more extraordinary, as the Agrigentines were fond of shows and dramatic performances; and the Romans never dwelt in any place long without introducing their savage games. See GIRGENTI.

AGRINTINE SALT, in natural history, a kind of salt famous among the ancients for its not crackling in the fire as the common salt does.

AGRIGNAN, one of the Ladronc islands. It is mountainous, has a volcano, and is 50 miles in circumference. N. lat. 19° 4'. E. long. 146°.

AGRII, in ancient geography, a people of Ethiopia, called by the Greeks Cynamolgi.

AGRILIUM, in ancient geography, a town of Asia Minor, in Bithynia, to the south-east of Nicæa.

AGRIMONIA, **AGRIMONY**, in botany, a genus of the dodecadriis digynia class and order, of the natural order of scenticosa, and of the rosaceæ of Jussieu. CAL. one-leaved, five cleft, acute, small, superior: PERIANTH. permanent, fenced with an outer calyx: COR. five, flat, emarginate petals, with the claws narrow, inserted into the calyx; STAM. capillary filaments, shorter than the corolla, inserted into the calyx; ANTH. small, twin, and compressed; PIST. germ. inferior; STYLES, simple, of the length of the stamina; STIGMAS, obtuse, no pericarpium; CAL. contracted at the neck, and hardened; the seeds are two and roundish. The number of stamina is very uncertain, twelve, ten, seven. The agrimonia of Tournefort has the outer calyx growing to the inner; two seeds; stamina twelve to twenty; fruit fenced with bristles. The agrimonoides T. has the outer calyx detached; one seed; stamina about seven. Of this genus there are five species.

AGRIMONOIDES, in botany, a species of agrimony. This plant flowers in April, and comes to perfection in May. It grows in some mountainous parts of Italy; and is sometimes called pimpinella solio agrimonie.

AGRIMONY, **HEMP**. See EUPATORIUM.

AGRIMONY, **WATER HEMP**. See BIDENS.

AGRIOCARDAMUM, in botany, CARDAMINE, which see.

AGRIOCASTANUM, earth nut, pig nut.

AGRIOCINARA, a species of wild artichoke.

AGRIOCOCCIMELA, the prunus sylvestris, or plum tree.

AGRIOMELLA, the crab apple.

AGRIOMELANZANION, in the botanical writings of the ancients, a word that has perplexed many later botanists. The Arabian writers, Avicenna and Serapion, used the word bedengian, for the fruit of the pomum amoris, a kind of esculent nightshade, or solanum, called by the old Greek writers, as Theophrastus, &c. strychnus, and only distinguished from the other strychni, or nightshades, by its being described as wholesome, not poisonous. From this Arabic word bedengian, the Italians formed their word melanzana, and the late Greek writers their melanzion, which they used as the name of the same fruit. This, when the plant was cultivated in gardens, was probably larger and fairer than when it grew wild; but, in this latter state, was not less used, and was distinguished by the term agriomelanzion.

AGRION. See PEUCEDANUM
AGRIONARDUM, valerian.

AGRIONIA, in Grecian antiquity, festivals annually celebrated by the Boeotians in honour of Bacchus. At these festivals the women pretended to search after Bacchus as a fugitive; and after some time, gave over their enquiry, saying, that he was fled to the Muses, and was concealed among them.

AGRIOPHAGI, from *αγριος*, wild, and *φαγω*, I eat; in antiquity, a name given to those who were supposed to feed on wild beasts, such as lions, panthers, &c. Pliny and Solinus speak of Agriophagi in Ethiopia; and Ptolemy of others in India on this side the Ganges.

AGRIOPHYLLION. See PEUCEDANUM.

AGRIORIGANUM, in botany, wild marjoram.

AGRIOSELINUM, wild parsley.

AGRIPALMA, mother wort.

AGRIPPA, an ancient city of Apulia.

AGRIPPA, in midwifery, a name古iently applied to children, born in an unusual or irregular manner; particularly such as presented the feet instead of the head. This was, according to Pliny, because they were (*εργε parti*) born with difficulty. Salmasius derives it from the Greek *αγριευ*, venari, and *πτηνος*, equus, q. d. a hunter of horses, and Daventer has a particular chapter of agrippas, or infants coming with their feet foremost, which, according to him, is one of the most convenient and safe ways for a mature birth.

AGRIPPA, (Cornelius,) born at Cologne in 1486 a man of considerable learning, and by common report a great magician; for the monks at that time suspected every thing to be heresy or sorcery which they did not understand. He composed a Treatise on the Excellence of Women, to insinuate himself into the favour of Margaret of Austria, governess of the Low Countries: and accepted of the charge of historiographer to the emperor, which that princess gave him. The treatise on the Vanity of the Sciences, which he published in 1550, enraged his enemies extremely; as did that of Occult Philosophy, which he printed soon after at Antwerp. He was imprisoned in France, for a satire he had written against the mother of Francis I. but was liberated, and went to Grenoble, where he died in 1534.

AGRIPPA, (Herod I.) the son of Aristobulus and Mariamne, and grandson to Herod the Great, was born A. M. 3997, three years before the birth of our Saviour, and seven years before the vulgar era. After the death of Aristobulus his father, his grandfather took care of his education, and sent him to Rome to make his court to Tiberius. The emperor conceived a great affection for him, and placed him near his son Drusus. Agrippa very soon won the graces of Drusus, and of the empress Antonia; but Drusus dying suddenly, all those who had been much about him, were commanded by Tiberius to withdraw from Rome, lest the sight and presence of them should renew his affliction. Agrippa, who had been extravagant, being thus obliged to leave Rome, overwhelmed with debt, retired to Massada, where he lived rather like a private person than a prince.

Herod, the Tetrarch, his uncle, who had married Herodias his sister-in-law, assisted him for some time, made him principal magistrate of Tiberius, and presented him with a large sum of money: but all this was not sufficient to answer the excessive expenses and profusion of Agrippa; so that Herod growing weary of assisting him, and reproaching him with his bad economy, Agrippa returned to Rome. Upon his arrival, he was received into the good graces of Tiberius, and commanded to attend Tiberius Nero, the son of Drusus. Agrippa, however, chose rather to attach himself to Caius Caligula, the son of Germanicus, as if he had some prophetic views of the future elevation of Caligula, who at that time was universally beloved. The great assiduity and agreeable behaviour of Agrippa, so far engaged this prince, that he kept him constantly about him. But Agrippa being overheard one day by Eutyches, a slave whom he had made free, to express his wishes for Tiberius's death and the advancement of Caligula, the slave betrayed him to the emperor; whereupon he was loaded with fetters, and committed to the custody of an officer. Tiberius soon after dying, and Caligula succeeding, he heaped many favours upon Agrippa; changed his iron fetters into a chain of gold; set a royal diadem on his head; and gave him the tetrarchy which Philip, the son of Herod the Great, had been possessed of, viz. Batanaea and Trachonitis. To this he added that of Lysanias; and Philip returned into Judea to take possession of his new kingdom.—Caligula being soon after killed, Agrippa, who was then at Rome, contributed much by his advice to maintain Claudius in possession of the imperial dignity, to which he had been advanced by the army. But in this affair Agrippa exhibited more cunning than honesty; for while he made a show of being in the interest of the senate, he secretly advised Claudius to be resolute, and not to abandon his good fortune. The emperor, as an acknowledgment for his kind offices, gave him Judea and the kingdom of Chalcis, which had been possessed by Herod his brother. Thus Agrippa became suddenly one of the greatest princes of the East; and was possessed of as much, if not more territory than his grandfather. He returned to Judea, and governed it to the great satisfaction of the Jews. But the desire of pleasing them, and a mistaken zeal for their religion, induced him to commit an unjust action, which is recorded Acts xii. 1, 2, &c. for about the feast of the passover, A. D. 44. St. James the son of Zebedee, and brother to St. John the Evangelist, was seized by his order and put to death. He also imprisoned St. Peter, till the festival was over, that he might then have him executed. But Peter being miraculously delivered the designs of Agrippa were frustrated. After the passover he went from Jerusalem to Caesarea, where he had games performed in honour of Claudius. Here the inhabitants of Tyre and Sidon waited on him to sue for peace. Agrippa being come early in the morning to the theatre, to give them audience, seated himself upon his throne, dressed in a robe of

silver tissue, worked in the most admirable manner. The rising sun darting full upon it, gave it an uncommon lustre, and therefore, when the king spoke to the Tyrians and Sidonians, the parasites around him began to say that it was the voice of a god, and not of a man. Instead of rejecting these impious flatteries, Agrippa received them with an air of complacency; but the gratification of his vanity was disturbed by observing an owl above him. He had seen the same bird before, when he was in bonds by order of Tiberius; and it was then told him that he should soon be set at liberty: but that whenever he saw the same bird a second time, he should not live above five days afterwards. He was therefore extremely terrified; and died at the end of five days, racked with tormenting pains in his bowels, and devoured with worms. Such was the death of Herod Agrippa, after a reign of seven years, in the year of Christ 44.

AGRIPPA, Herod, II. son of the preceding Herod Agrippa, was made king of Chalcis, but three or four years after, was deprived of his dignity by Claudius, who gave him other provinces instead of it. In the war Vespasian carried on against the Jews, Herod sent him a succour of 2000 men; by which it appears, that though a Jew by religion, he was yet entirely devoted to the Romans, whose assistance indeed he wanted, to secure the peace of his own kingdom. He lived to the third year of Trajan, and died at Rome, A. C. 100. He was the seventh and last king of the family of Herod the Great. It was before him and Berenice his sister and wife, that St. Paul pleaded his cause at Cæsarea.

AGRIPPA, (Marcus Vipsanius,) although of plebeian birth, was son-in-law to Augustus, and one of the most considerable generals among the Romans. Augustus's victory over Pompey and Marc Antony was owing to his counsel. He adorned the city with the pantheon, baths, aqueducts, &c.

AGRIPPINA COLONIA UBIORUM, in ancient geography, now Cologne; so called from Agrippina, who had a colony sent thither by the emperor Claudius, to honour the place of her birth. See COLOGNE.

AGRIPPINA, the daughter of Germanicus, sister of Caligula, and mother of Nero; a woman of wit, and of some learning, but excessively licentious. She was thrice married, the last time to Claudius, her uncle, whom she poisoned to make way for Nero her son. Nero afterwards caused her to be murdered in her chamber, when she bid the executioner stab her first in the womb, that had brought forth such a monster.

AGRIPPINIANS, in church history, the followers of Agrippinus, bishop of Carthage, in the third century, who first introduced and defended the practice of rebaptization.

AGRIPPINUS. See last article.

AGRISSE', v. or { **Agrisan**, Sax. to crush; by

AGRISSE'. } an easy transition, to affright; to astonish; to make frightful; to dread.

And powring forth their bloud in brutish wise,

That any iron eyes, to see, it would agrise.

Spencer's Faerie Queene, v. x. 28.

Yet not the colour of the troubled deep,
Those spots supposed, nor the fogs that rise
From the dull earth, me any whit agrise.
Drayton's Man in the Moon.

AGRIUM, in the *materia medica* of the ancients, a name given to an impure sort of natrum. The pure sort of this salt they called halmyrhaga, and the coarse kind agrium. The former they had from Media, the latter from Thrace.

AGROM, in medicine, a disease frequent in Bengal, and other parts of the Indies, wherein the tongue chaps and cleaves in several places, is extremely rough, and sometimes covered with white spots. The Indians are much afraid of this disease, which they attribute to extreme heat of the stomach. Their remedy is, to drink some chalybeate liquor, or the juice of mint.

AGROP'E v. See GROPE.

For who so will it wel agrope,
To hem belongeth all Europe,
Whiche is the third parte euen
Of all the worlde vnder the heuen.

Gower. Con. A. b. v.

AGROSTEMA, *WILD LYCHNIS*, or *CAMPION*, a genus of the pentagynia order, belonging to the decandria class of plants; and in the natural method ranking under the twenty-second order, caryophyllei. The characters are: CALYX, a single leaved perianthium, leathery, tubular, quinquedentated, and persistent: COR. five un-gulated petals: STAM. ten subulated filaments; the antheræ simple: PIST. has an egg-shaped germen; the styli are five, filiform, erect, and the length of the stamina; the stigmata are simple: the pericarpium is an oblong covered capsule, having two cells and five valves: the seeds are numerous and kidney-shaped; the receptacula are as many as the seeds, the interior ones gradually longer. The most remarkable species are: 1. The *Agrostema coronaria*, or single-rose campion. 2. The agrostema githago, hairy wild lychnis, or common campion, which grows naturally in corn-fields in most parts of Britain. And 3. The agrostema jovis, or umbelliferous mountain campion, which grows naturally upon the Helvetian mountains.

AGROSTIS, *BENT-GRASS*, in botany, a genus of the triandria order, belonging to the digynia class of plants; and in the natural method, ranking under the fourth order, graminæ. The characters are: CAL. a one-flowered, two-valved, pointed gluma, rather less than the corolla: COR. two-valved, and pointed. STAM. three capillary filaments, which are larger than the corolla. The antheræ are forked. PIST. a roundish germen; the styli are two, reflexed and villous; the stigmata hisped longitudinally. The pericarpium is the corolla growing to the seed, not gaping. The seed is one, globular, and pointed at both ends. There are fifteen species; eight of them natives of Britain.

AGROSTOGRAPHIA, from *ἀγροτης*, grass, and *γραφη*, description, the history or description of grasses. John Schenckher composed a learned and laborious work under this title, containing an exact description of about 400 different species of grass, and yet the subject is still unexhausted. See GRASS.

AGROT'ED. Cloyed, surfeited, saturated. *Skinner and Tyrwhit.*

This honorable quene Philis doth him chere
Her liketh wel his sport and his manere,
But I am agroted here beforene,
To write of hem that in loue been forsworne.

Chaucer. The Legend of Good Women.

AGROTIRI, in ancient geography, the most southern promontory of the island of Cyprus, east of Limassol. It is connected with the continent by a very narrow tongue of land, now called cape De Gatti, on account of the great number of cats kept by the monks, who in the fourth century obtained permission to establish themselves there, as well as on mount Olympus, on condition of keeping a great number of those animals for hunting snakes, which had multiplied to an alarming degree; and which, it is said, have no greater enemies than cats. See *Sonnini's Travels in Greece and Turkey*.

AGROUND' a. On ground.

And headlong downe the master falles, and thrice
the keele aground,
The water whirl'd, and at the last the wilde sea
swallow'd round.

Virgil's Aeneidos, b. 1. *By Thos. Pharr.*
With our great ships, we durst not approach the
coast; we having been all of us aground.

Sir W. Raleigh's Essays.
Say what you seek, and whither were you bound,
Were you by stress of weather cast aground?

Dryden's Aeneid.

The bear, presuming in his skill,
Is here and there officious still,
Till, striking on the dangerous sands;
Aground, the shattered vessel stands.

Gay. Fable 5.

A-GROUND, in maritime affairs, the situation of a ship whose bottom, or any part of it, rests upon the ground.

AGRYLA, in ancient geography, a city of Sardinia, founded, according to Stephen Byz, by a colony from Athens.

AGRYPNIA, *ἀγρυπνία*, Gr. among physicians, a privation of sleep; a troublesome symptom of nervous and febrile diseases. It is otherwise called, vigilæ, pervigilium, &c. In the Greek church, it is used for the vigil of any of the greater feast days, observed by the monks and clergy.

AGUACAGUA, a town of Guiana, of South America, situated on the Caroni, which enters the Orinoco. Long. 62°. 42'. W. lat. 8°. 22'. N.

AGUACATAL, a town of South America, in the province of Antioquia, on the river Cauca.

AGUACATENANGO, a town of South America, in the kingdom of Guatimala. Long. 91°. 57'. W. Lat. 16°. 18'. N.

AGUADA, a town of Porto-Rico, situated in a bay and on a river of its name. Long. 67°. 6'. W. Lat. 18°. 25'. N.

AGUADA, a river of Brazil, in the province of Rio Grande, which enters the sea close to Cape San Roque.

AGUADA, a point of the province of Cartagena, which forms the mouth of the gulf of Darien, South America.

AGUADA, CAPE, a cape on the western coast of East Florida, in the gulf of Mexico. Long. 82°. 15'. W. Lat. 26°. 22'. N.

AGUADILLA, a river of South America, in the province of Terra Firma, which enters Chagre near its estuary.

AGUAGUIN, in botany, the name of a shrub among the Africans, who regard it as a balsamic and anti-vulnerary. The leayes of this shrub resemble those of our common lilac; they grow alternately, and stand upon foot-stalks of half an inch long; and when held up to the light, shew a fine texture of the smaller veins. *Philosophical Transac.* N^o. 232.

AGUAPECACA, in ornithology, the name of a Brazilian bird of the moor-hen species. It is of the size of a pigeon, very long-legged, and has a beak like that of the gallinaceous kind. Its back and the upper part of its wings are brown, and in each wing is a sharp horn, or prickle, serving for defence.

AGUARA-PONDA, in botany, a plant otherwise called *viola spicata Brasiliana*. It grows to the height of a foot and a half, or more, with a smooth, round, green, and jointed stalk: the top of the stalk bearing an ear a foot long, smooth, and covered with flowers of a fine violet azure, or the colour of our *viola martia*, consisting of five roundish leaves. At each joint come forth four, five, or more, narrow, serrated, pointed, green, and unequal leaves. The whole flower is not unlike the *viola martia*, and has somewhat of its smell. The root is straight, of a moderate thickness, and shoots out into abundance of lesser ones, and these again into filaments. There is another kind, distinguished by the wideness of its ear of flowers, which represents a helmet of a green colour. It is marked with cubic pits, from whence proceed azure flowers.

AGUARA-QUIVA, in botany, a Brazilian plant, thought, by Ray, to be the *solanum vulgare*, or common night-shade.

AGUARICO, a river in the province of Mai-nas, South America, which descends from the grand Cordillera of the Andes, near the town of San Miguel de Ibarra, washes the territory of the Sucumbios Indians, and enters the Napo, in lat. 1°. 23'. S. Its sands contain much gold.

AGUAS BELLAS, a town of Portugal, in Estremadura, with a district of two parishes. It is in the circle of Thomar. Also, a river of South America, which enters the Parana from the W.

AGUAS CALIENTES, a city of New Spain, South America, in the kingdom of New Gallicia. It contains three convents, and about 500 Spanish families, besides mulattoes, and those of a mixed breed. The natural curiosities belonging to this place are two warm springs, about ten yards apart, each affording an abundant supply of water, which is impregnated with copper, and is more than thirty-three degrees above blood heat. It is 140 leagues N. N. W. of Mexico, and thirty-five of Guadalaxara. Long. 101°. 51'. 30". W.; lat. 22°. 2'. N. Also a settlement on the coast of Venezuela.

A'GUE, v. & n. { Gothic, *agis*, terror; an **A'GUED,** } intermitting fever, in which **A'GUISH.** } cold fits are succeeded by hot; the cold fit is the *ague*, the hot the fever.

For I will bring vpon you fearfulness, swellying of body, and the burnyng *agew*, to consume your eyes and gendre sorrow of hert.

Bible, 1539, *Leuit. xxvi.*

This Alastor hath left nothing unsearched or unassailed by his impudent and licentious lying in his *agueish* writings, for he was in his cold quaking fit all the while.

Ben Jonson's Discoveries.

All hurt behind, backs red, and faces pale,
With flight and *ague* fear!

Shakspeare's Coriolanus.

Our castle's strength

Will laugh a siege to scorn. Here let them lie,
Till famine and the *ague* eat them up.

Shakspeare.

Though

He feels the heats of youth, and colds of age,
Yet neither tempers nor corrects the other;
As if there were an *ague* in his nature,
That still inclines to one extreme.

Den. Sophy.

AGUE, in medicine, a disorder belonging strictly to the class of fevers, and consisting of paroxysms recurring at stated periods, with longer or shorter intervals of apyrexia. It is included in the febres intermittentes of nosological writers. But with personal recollections of its cold embrace, we shall subjoin a popular description of it; and a few of the best remedies.—

An *ague* paroxysm is divided into the cold, the hot, and the sweating stages. The cold stage is marked by yawning, lassitude, coldness of the surface of the body, shaking or trembling of the limbs, paleness of the countenance, and constriction of the skin; more or less nausea, and sometimes vomiting, a weak and small pulse, and not unfrequently a considerable degree of stupor; together with an irresistible shaking of the teeth and jaws. We have sat shivering with this disorder before a large fire, in the height of summer. To this succeeds the hot stage, in which there is a preternatural degree of warmth over the whole body, accompanied by a redness and turgescence, together with a strong and full pulse, great irritation, and often some degree of delirium. These symptoms are followed by the sweating-stage, in which there is a profuse exhalation from the pores of the skin, with a flow of urine, depositing a copious sediment, of a lateritious or brick-dust appearance. By these evacuations of sweat and urine, the febrile symptoms are carried off, and the patient generally falls into a refreshing sleep, from which he awakes without any remains of indisposition, except a slight degree of languor and debility.

He then continues capable of sitting up and going about, with tolerable appetite and spirits, until the next return of the paroxysm. According to the length of the apyrexia, or intermission between one febrile paroxysm and another, agues are denominated quotidiants, tertians, or quartans; which see under their respective titles. Sydenham distinguished them, from the season of the year in which they appeared, into vernal and autumnal agues; the former of which are always more easily cured than the latter. By others they have been distinguished into simple and complicated, regular and irregular, mild and malignant, &c. Of all agues or intermittents, the quartans are the most obstinate, being generally accompanied with more or less of visceral

obstruction. Hence they are apt to terminate in dropsy, and thus sometimes prove fatal. In general, however, it may be said of agues, that they are rather obstinate than dangerous disorders.

They occur chiefly in low situations, where there are shallow stagnant waters. Hence their frequency in Holland and Flanders, and in the flat marshy parts of some counties in England, such as Lincolnshire, Cambridgeshire, Kent, &c. For the same reason they are very common in America, the East and West Indies, &c. Within our personal knowledge, the drainage and improvement of a district of this description, has almost banished the complaint. The exhalations which arise from stagnant muddy waters (marsh miasma, as they are termed) in these situations, are considered as the exciting cause of agues. Hence the prophylactic measures are obvious; viz. to avoid or remove from such situations. Where this cannot be done, the body should be protected from damp by proper woollen clothing; fatigue, and sudden alternations of heat and cold should be avoided, and the whole system be fortified by proper exercise and a somewhat generous diet.

Agues are cured by medicines which, at the same time that they exert a tonic action, produce and keep up an impression upon the system, greater than that communicated by the causes which occasioned the disease. Such medicines are the Peruvian bark, various bitter and astringent drugs (given alone or in combination with opiates and aromatics,) certain metallic salts, such as vitriolated iron, vitriolated copper, vitriolated zinc, &c. See Lind on Diseases of Hot Climates, Appendix, p. 308, et seq. But as these medicines are only employed during the intermissions, it will be proper first to mention what should be done during the fits.

It will be sufficient in the cold stage, to cover the patient with bed-clothes, and to give some warm tea with a tea-spoonful of hartshorn drops; or some weak warm wine and water, with the same quantity of hartshorn. In the hot stage, an antimonial, joined with saline medicines and opiates, will be proper, in order to bring on a perspiration, whereby the fit is carried off. The opiate, in conformity with Dr. Lind's directions, should be given in a full dose; viz. fifteen or twenty drops of laudanum in some lightly aromatic draught, or in case of costiveness, in an ounce or two of aloetic wine. The sweating stage will thus be accelerated; and as soon as it is over, the Peruvian bark should be freely administered, in doses of one or two drachms, every two hours. In some instances, however, it may be previously necessary to cleanse the stomach by an emetic, and the bowels by a gentle cathartic. The bark is then to be continued throughout the whole intervals of apyrexia, until the next accession of the paroxysm. This method is to be persisted in until the disorder is removed; and even for some time after, in order to prevent a relapse. The bark may be given in various vehicles, in combination with aromatics and other additions, according to circumstances.

For examples of which see Thesaur. Med. or New Collection of Medical Prescriptions, third edition, under the class of tonics.

If the Peruvian bark disagree with, or is refused by the patient, combinations of other tonics, and bitters may be given; such as powders composed of dried chamomile flowers and myrrh, each a scruple; prepared kali ten grains, or boluses composed of alum fifteen grains; nutmeg and extract of gentian, each ten grains. These may be administered every five or six hours during the intermissions. Some agues have been cured by giving a quarter of a grain of the cuprum vitriolatum every three or four hours during the apyrexia; this, however, is a very rough medicine, and commonly produces too much sickness to be persisted in. Vitriolated zinc has been employed with better success, in doses of three grains every fourth hour. Some practitioners recommend certain preparations of arsenic; but while so many other powerful and safer remedies present themselves, arsenic (in our opinion) should rarely be resorted to. The best authors who, in this country, have written upon agues, are Sydenham, Morton, Cleghorn, Lind, Fordyce; also Wilson on Febrile Diseases. Among foreigners, Torti, Werlhof, Quaria, &c.

AGUE-CAKE, a name sometimes given to a hard tumor on the left side of the belly, lower than the false ribs, said to be the effect of intermitting fever.

AGUE-DROPS. See ARSENIC.

AGUE-TREE, sometimes written corruptly, AGUE-PER, is a name given by some to sassafras, on account of its febrifuge virtue.

AGUEPERSE. See AIGUEPERSE.

AGUERRY, v. Fr. *aguerrir*, to accustom to the hardships of war; to discipline troops.

An army the best *aguerried* of any troops in Europe that have never seen an enemy. Lyttleton.

AGUESSEAU, (Henry Francis D'), chancellor of France, was born at Limoges in 1668, of an ancient family of Saintonge. Voltaire speaks of him as the most learned magistrate his country ever produced. He received the first rudiments of his education from his father, and his taste for poetry from the society of Boileau, Racine, and other eminent writers, with whom he associated at an early period of life. Having held the office of advocate-general of Paris for ten years, he was appointed procureur-general in 1700; and in this situation distinguished himself by introducing several excellent jurisprudential regulations. He also directed a particular attention to the hospitals, and to the hardships occasioned by the scarcity in 1709; and was the strenuous defender of the liberties of the Gallican church, in opposition both to Louis XIV. and the chancellor Voisin, who solicited his concurrence in favour of the bull Unigenitus. After the death of Voisin, and in the regency of the duke of Orleans, he was made chancellor; and performed the duties of his office with eminent wisdom and success. In his resistance of the financial project of law, he prevailed for some time; but when the regent determined to adopt

it, he was constrained to retire to his country seat at Fresnes; but was recalled in 1720. He was again deprived of his office in 1722, recalled by cardinal Fleury in 1727, and re-invested with the seals in 1737, which he held till his death. From the year 1729 to 1749 he was sedulously employed in reforming the laws, and remedying the notorious abuses that disgraced and obstructed their administration. But in this extensive and laborious employment his progress was slow, and his conflicts with opposing interests so great as to produce great apparent indecision in his judgment. His apology will remind our readers of what, it is possible, might be the language of a living and most upright English judge: 'When I recollect,' said he, 'that the decree of a chancellor is a law, I think myself permitted to take a long time for consideration.' His life, though assiduously occupied, was prolonged by his temperance and equanimity; but in the year 1750 his increasing infirmities diminished him of the necessity of withdrawing from public employments; and in 1751, he closed his life at the advanced age of eighty-three years.

Besides the languages of antiquity, Aguesseau was acquainted with all the principal modern ones; and to his knowledge of the history of all ages and nations, he added that of jurisprudence in its most extensive sense. He never sought office; but always manifested a disposition superior to the honours which his talents and merit claimed, and a desire to be useful rather than to aspire after power. Of his frugality, and of the various emoluments annexed to the dignities he possessed, the only fruit that remained was his library, in the improvement of which he limited himself to a certain annual expence. In the period of his retirement, which he called 'the fairest days of his life,' he devoted himself to the maturing of his plan of legislation, to the education of his children, and to a variety of literary pursuits, among which were mathematics and the belles lettres; and these, together with agriculture, he deemed his recreations in the intervals of his severer occupations. When the public however demanded his services, he surrendered the satisfactions of retirement and the pleasures of domestic life. Having in 1694 married Anne le Febure d'Ormesson, it was said on this occasion, that virtue and the graces were now first seen in alliance; but he had the misfortune to lose her in 1735. His grief corresponded to the affection that subsisted between them; but he hastened to devote himself to the functions of his office; alleging, 'that his services were due to the public, and it is not just,' said he, 'that it should suffer by my domestic affliction.' It is said that he never passed a day, from his childhood, without reading some parts of the scriptures; and was heard to say, that this was the balm of his life. Of his works nine volumes 4to. have been published. In these, he is said to have thought like a philosopher, and spoken as an orator. His style is chaste and harmonious, but deficient in warmth. When he once consulted his father on a discourse which he had taken pains to compose, and which he wished farther to improve, his father gave his opinion:

'the fault of your discourse is its being too elegant; it will certainly be less so if you touch it again.' *Nouv. Dict. Hist. Biog. Dict.*

AGUGLIA, in ichthyology, the name given by the Italians to the *acus* of Oppian, called in English the gar-fish.

AGUJA POINT, part of the land of Terra Firma, which projects farther into the sea, between Santa Marta and Cape Chichibacoa. Also of a low point on the coast of the South Sea, in the province of Piura, Peru.

AGUIGNAN, or island of Holy Angels, an island in the South Pacific Ocean, three miles in circuit, and a mile distant from the southwestern point of Tinian. It was visited by Servidores, a Spanish priest, in the year 1669. Lat. 14°. 48' N.

AGUILA, a town and river in the province of Habat, in the kingdom of Fez, subject to the emperor of Morocco.

AGUILA CAPE, a point or cape of one of the Falkland Isles, so named from having been discovered by the French frigate the Aguila.

AGUILA, VILLA GUTTIEREZ DE LA, a town of Mexico, in the intendancy of Guadalaxara, formerly very considerable, but now much decayed. It is nine leagues E. of Xeres.

AGUILAR, a town of Spain, in the kingdom of Navarre, 24 miles W. of Estella.

AGUILAR-DEL-CAMPO, a town of Spain, in Old Castile, on the Alhama.

AGUILER, from *aguille*, a needle, French, a needle-case.

AGUILLANEUF, or AUGILLANEUF, a form of rejoicing used among the ancient Franks on the first day of the year. The word is compounded of the French *a*, to, *gui*, misleto, and *l'an neuf*, the new year. Its origin is traced from a ceremony of the druids, who used to go early in December, which with them was reputed a sacred month, to gather misleto of the oak in great solemnity. The prophets marched in the front, singing in honour of their deities; after them came a herald with a caduceus in his hand; these were followed by three druids abreast, bearing the things necessary for sacrifice; last of all came the chief or arch druid, accompanied with the train of people. The chief druid climbing the oak, cut off the misleto with a golden sickle, and the other druids received it with a white cloth; on the first day of the year it was distributed among the people, after having blessed and consecrated it, by crying, a *gui l'an neuf*, to proclaim the new year. This cry was continued in Picardy, with the addition of *plantez, plantez*, to wish a plentiful year. The name aguillaneuf was also given to a sort of begging for church tapers, practised in some dioceses, on new year's day, by troops of young people of both sexes, having chiefs, &c. It was attended with various ridiculous ceremonies, as dancing in the church, &c. which occasioned the synods to suppress it.

AGUILLES, or AUGUILLES, cotton cloth, manufactured at Aleppo.

AGUILION, or AGUILONIUS, Francis, a Jesuit, born at Brussels, at the close of the sixteenth century, was rector of the Jesuits college at Antwerp, and eminent for his skill in mathe-

matics. He was the first who introduced that science among the Jesuits in the low countries: His book on optics, entitled, ‘Opticorum, lib. vi. Philosophicis juxta ac Mathematicis utilles,’ was printed at Antwerp in 1613, fol. and he was employed in finishing a treatise on ‘Catoptrics and Dioptrics,’ at the time of his death, which happened at Antwerp in 1617, in the 50th year of his age. Aguilon is also said to have written a treatise on ‘Projections of the Sphere.’ He understood several languages, and his judgment was as accurate as his learning was extensive. Under severe paroxysms of the asthma, to which he was subject, he is reported to have often said : ‘ Let God’s will be done—I submit to it—I am willing to form myself absolutely upon the divine pleasure—I have now the torments which I often wished for, and desired of God.’

AGUIR, a small town of Portugal, in the Provvedoria of Beja, in Alentejo, containing about 450 inhabitants.

AGUIRRA, (Joseph Sænz de,) a Benedictine, and one of the most learned men of the seventeenth century, was born in 1630. He was censor and secretary of the supreme counsel of the Inquisition in Spain, and interpreter of the scriptures in the university of Salamanca. He printed three volumes in folio upon philosophy, a commentary on Aristotle’s ten books *Et Ethics*, and other pieces. He died at Rome in 1699.

AGUIRRA, a river of Guiana, South America, which rises about fifty miles north of the great river Orinoco, in the territory of the missions of the Capuchins, and descending by the mountains of Itamaca, falls into the Orinoco, on the south side, just at its mouth. Its navigation is greatly impeded by the tall trees which line its banks; so that though formerly accessible to schooners and brigs, it can now hardly be navigated, except by small shallops.

AGUIRRE, a river of South America, in Venezuela, which, rising near the city of Niura, runs south, and enters the Sarara.

AGUISE’, v. See *GUISE*.

As her fantastic wit did most delight,
Sometimes her head she fondly would *aguise*
With gaudy garlands, or fresh flowers dight
About her neck, or rings of rushes plight.

Faerie Queene.

Then gan this crafty couple to devise,
How for the court they might themselves *aguise*,
Spenser’s Mother Hubbard’s Tale.

AGUL, in botany, a synonyme of the hedyasrum. See *HEDYSARUM*.

AGUR, the son of Jakeh, the author of the thirtieth chapter of the Proverbs, a person of whom neither sacred nor profane history records any thing, more than is contained in the first verse of that chapter. On this account he has become the subject of much fruitless conjecture and idle controversy, among commentators; some of whom confound him with Solomon, while others make him altogether an ideal being, by telling us, that the word agur signifies a congregation. The emphatic and sublime queries in the fourth verse, and the much admired prayer for a moderate competency, equally removed from the extremes of poverty and riches, in the eighth and ninth, sufficiently prove the title of his

writings to be ranked along with those of Solomon and Lemuel.

AGURAH, אֲגָרָה, Heb. In Jewish antiquity the thirtieth part of a silver shekel. The agurah is the same with gerah, and keshitah. The septuagint renders it ὀβολός.

AGURIUM, or **AGYRIUM**, in ancient geography, a town of Sicily, in the Val di Demona, near the river Semetus. It was the birth-place of Diodorus Siculus, as he himself testifies; but he calls it Argyrium. It is now called S. Philippo d’ Arginone.

AGUSADURA, in ancient customs, a fee due from vassals to their lord, for sharpening their plowing tackle. Anciently, the tenants in some manors were not allowed to have their rural implements sharpened by any but whom the lord appointed; for which an acknowledgment was to be paid, called agusadura, which some take to be the same with what was otherwise called reillage; from the ancient French reille, a plough-share.

AGUSAGE. See last article.

AGUSTINI, in mineralogy, a term by which professor Tromsdorff has designated a supposed new earth, discovered by him in 1800. It bears a great resemblance to alumina. *Annales de Chemic.* xxxiv. p. 133.

AGUTI, in zoology, an American animal, much resembling the Guinea pig, having the characters of the rat kind, with the voice and hair of the hog. The hairs are very hard, thick, and glossy, and are of a mixed colour, of a reddish and brown, with more or less black; those on the belly, however, are yellowish; its head and whiskers are like those of the rabbit kind, but that of the nose is sharper, and the upper chaw longer than the under one, as in the hog; the upper lip is split as in the hare, and the legs are naked, or have at the utmost only a few hairs on them; the fore feet have four toes, and the hinder ones six, and these are much longer than the fore legs; its tail is very short, its eyes prominent, and its voice altogether resembles the grunting of a hog. It is a very voracious animal, devouring its food with extreme eagerness, and using its fore feet for hands, in the manner of the squirrel. It runs very swiftly, and is very expert at digging, so that it soon buries itself in the earth. When provoked, it raises all the hair of its back upright, and strikes the earth with its hinder feet.

AGUTIGUEPA obi Brasiliensibus, in medicine, the arrow-root, or sagittaria alexipharmacæ of the West Indies.

AGUTI TREVA, insulæ marignanæ, in botany, a plant mentioned by De Laet. It has the leaves of the orange-tree, only thinner, a dewy flower, a large fruit, with a greenish rind, which contains kernels like those of the pomegranate, thin, sweet, and not ill-tasted.

AGYEL, in antiquity, a kind of obelisks consecrated to Apollo, or Bacchus, or both, and placed in the vestibulus of houses, for their security. They were generally huge stones, and sometimes timber, having either a circular or square basis, and terminating in a point at the top.

AGYLLA, Cervateri, in ancient geography,

a town of Etruria, near the sea, so called by the Pelasgi, who came hither from Thessaly. Strabo says, it was afterwards called Cære, from the Lydians hearing the inhabitants frequently repeating to them the Greek expression *χαιρε*, i. e. rejoice. Others, thinking this etymology more fanciful than just, deduce Agylla from gilla, water, as they had fountains in the neighbourhood; and Cære, might be formed from cari, or cariah, a town, in the language of the Lydians. Tarquin's family was banished to this town; and hither the vestals retired, when, in the year 363, the Gauls laid siege to Rome. The laws and police of this city are much commended. It was one of the first cities which became municipal. It was known only by its baths in Strabo's time.

AGYLLÆI, in ancient history, a denomination given to the Pelasgi, in Etruria. Here they preserved, with little alteration, the manners and religion of the ancient inhabitants of Greece; and furnished considerable fleets. They amassed a treasure at Delphi, by transmitting thither a tenth of their maritime profits; and by their commerce, acquired a degree of power, which rendered them important allies, or formidable enemies to their neighbours. Herodotus says, that their power was considerable in his time; and that, in consequence of an oracle, they had instituted funeral sacrifices and annual games, which they then celebrated. These people, who were sometimes called Tyrrhenians, sent succour to the Athenians in the Sicilian war, not long before the ruin of the Veii by the Romans. They formed an alliance with the Romans, which gave them all the advantages belonging to Roman citizens, without the charges attending them; and they became, under the name of Cærites, the third order of the republic. The Cærites bore arms in the Roman army, and were almost always united to the Romans, as Livy, lib. vii. c. xx. informs us; being considered not merely as allies, but as a part of the nation. At length, deserted by the Roman marine, which found more spacious and convenient ports; and losing its commerce, Cære declined, and the inhabitants, who were Romans, were indiscriminately blended with the other citizens.

AGYNEIA, formed of *a*, priv. and *γυνη*, a wife, in botany, a genus of the monoecia monodelphia class and order, according to Martyn; but in Gmelin's Linnæus, of the triandria monogynia, of the natural order of tricoccæ, and the euphorbiae of Jussieu. Its generic characters are, that the male flowers are below the female; *cal.* six-leaved: the leaflets oblong, obtuse, equal, and permanent; no corolla; in the male, instead of filaments, a column shorter than the calyx; three or four anthers, oblong, growing to the column below the top; in the female flowers, the germ of the size of the calyx, sub-ovate, obtuse, perforated at top with a six notched hole; neither style nor stigma; the pericarpium supposed to be a tricocca capsule. There are two species, *viz.* 1. *A. impubes*, with leaves smooth on both sides. 2. *A. pubera*, with leaves downy underneath; both are natives of China.

AGYNIANI, **AGYNII**, or **AGYNNENSES**, from *a*, negative, and *γυνη*, a woman, in church his-

tory, a sect who condemned the use of flesh, and marriage, as not instituted by God, but introduced at the instigation of the devil. They are said to have appeared about the year 694.

AGYRINENSES, or **AGYRINI**, the inhabitants of Agurium.

AGYRIUM. See **AGURIUM**.

AGYRTÆ, *αγυρτα*, Gr. in antiquity, a kind of strolling impostors who, like our gypsies, wandered about the country, telling fortunes at rich men's doors, pretending to cure diseases by charms, sacrifices, and other religious mysteries; and to expiate the crimes of their deceased ancestors by the virtue of certain odours and fumigations; to torment their enemies by the use of magical verses, &c. See **ÆRUSCATORES**.

AH, *interj.* This may be denominated a word in the vocabulary of nature, common at least to several languages, and expressing sometimes dislike and censure, contempt and exultation, compassion and complaint.

Ah! sinful nation, a people laden with iniquity, a seed of evil doers, children that are corrupters, they have forsaken the Lord. *Isaiah*, i. 4.

Let them not say in their hearts, *Ah!* so we would have it: let them not say, we have swallowed him up. *Psalm xxxv. 25.*

Ah me! the blooming pride of May,
And that of beauty, are but one:
At morn both flourish bright and gay,
Both fade at evening, pale and gone. *Prior.*
In youth alone, unhappy mortals live,
But *ah!* the mighty bliss is fugitive:
Discolour'd sickness, anxious labour come,
And age and death's inexorable doom. *Dryden. Virg. Geor.*

In goodness, as in greatness, they excel,
Ah! that we lov'd ourselves but half so well. *Dryden. Juv.*

Nymph of the grot, these sacred springs I keep,
And to the murmurs of these waters sleep;
Whoe'er thou art, *ah!* gently tread the cave,
Ah! bathe in silence, or in silence lave. *Pope's Translation of a Latin Inscription on an ancient Statue placed near a stream of water.*

AHA, or **AHU**, in zoology, a name given by the Persians to the cervus pygargus of the Linnaean system, or the tail-less roe of Pennant. It inhabits the lofty mountains of Hyrcania, Russia, and Siberia, beyond the Volga; and at the approach of winter descends into the plains and becomes hoary: it is called by the Russians dikeja roza, and by the Tartars saiga. It resembles the roe, but is much larger, being of the same deep red colour, with a large bed of white on the rump and buttocks, extending up the back: the fur is thick, in spring rough and erect, on the limbs and belly yellowish; the sides of the under lip and the space about the nose are black; but the point of the lip is white; the hairs of the eye-lids and round the orbits are long and black; the horns are very rugged at the bases, and full of knobs: the ears are covered on the inside with a very thick white fur.

AHAB, *אַהֲרֹן*, Heb. i. e. the brother's father, the son of Omri, king of Israel, succeeded his father, A. M. 3086. Of this monarch, it is difficult to determine, whether his wickedness and impiety, in establishing idolatry, and persecuting

the true prophets of the Almighty, notwithstanding repeated warnings and extraordinary visitations both of judgment and mercy from heaven, or his weakness and folly, in being thus led to his destruction by the advices of a beautiful but abandoned woman, were greatest. His marriage with Jezebel, his multiplied idolatries; the repeated warnings of Elijah and other prophets; the extraordinary famine of three years' continuance; the still more extraordinary circumstances attending the restoration of fertility and plenty; his discontent at Naboth's refusing to sell his patrimonial vineyard; his wicked queen's iniquitous murder of that honest Israelite, under colour and form of law; his seizure of the forfeited vineyard, with the dreadful judgments denounced against the whole royal family in consequence; and the complete execution of the threatened vengeance by the extirpation of the whole race, are recorded in the I and II books of Kings, and II Chronicles, and are well known to every reader of the scriptures.—Ahab was slain at Ramoth Gilead, A. M. 3117, in the thirty-first year of his reign, and A. A. C. 887.

AHAB, the son of Kolaiah, a false prophet, who, along with another, named Zedekiah, seduced the Jewish captives at Babylon, with deceitful hopes of a speedy deliverance, and thus excited their enmity against Jeremiah. But their pretences to inspiration were severely punished, for Nebuchadnezzar gave them the death he intended for Shadrach, Meshach, and Abednego, or rather a more cruel one, for it is said. Jer. xxix. 22. that he roasted them in the fire.

AHÆTULA, the trivial name of a species of the coluber. See COLUBER.

AIALOTH, in the materia medica, a Hebrew name used by some writers for the lignum aloës, or aloës wood.

AHANIGER, in ichthyology, a name given by Albertus, and others, to the fish acus vulgaris, or gar fish. The shape of this fish, which is very long and slender, has caused it to be confounded with the syngnathus, or tobacco-pipe fish, called also acus; but they differ extremely when examined; that being a true species of the syngnathus, and this of the esox or pipe.

AHANTA, a kingdom on the Gold Coast of Africa, extending from the Ancobra to the Chama; bounded on the west by Appollonia, and on the east by the Fantee territories. It is the richest, and in every respect the most improved district upon this coast. The sugar cane in particular grows to a great size. It produces also many kinds of excellent timber, one of which is little inferior to mahogany. The country contains mines of gold, but these are placed under Fetiche, from the idea that the working of them would corrupt their industrious habits. It is procured, however, of fine quality, from the inland countries of Warsaw and Dinkara. The coast contains many convenient creeks and harbours. The people are on the whole well disposed, and treat Europeans with respect, when their behaviour merits it. The government is a monarchy, but under very strict limitations. The principal towns are Axim, Dixcove, and Suckcondee.

AHASUERUS, in scripture history, king of Persia, the husband of queen Esther, to whom the Jews were indebted for a singular deliverance from extirpation, which they commemorate to this day, by an annual feast, i. e. that of PURIM, preceded by what is called the fast of Esther. Scaliger supposes Xerxes to be the Persian monarch intended by the sacred historian, who had a queen named Harrestris, of which he regards Esther as a corruption. Nor do we know that the fact which Herodotus supplies, of Xerxes having a son by Harrestris in the seventh year of his reign, is, in itself, any proof to the contrary. According to Prideaux, Conn. v. i. p. 361, &c. the Ahasuerus of Scripture was Artaxerxes Longimanus; the LXX. constantly using the word Artaxerxes, as he alleges, for that monarch's name, as do the apocryphal additions to the book of Esther. And Josephus asserts, that Artaxerxes Longimanus was the protector of his nation on this occasion. But archbishop Usher and F. Calmet contend, principally from the chronology of the period, that this Ahasuerus was Darius Hystaspes: and we incline to this opinion, as on the whole the most probable. Only when these learned writers suppose that Atossa was the Vashti of scripture, they seem to forget, that the princess of the former name is said to have retained her influence over Darius until his death, to have outlived him, and to have obtained the succession to the crown, for her son Xerxes; whereas Vashti was finally removed from the king's presence according to Esther, i. 19. and resigned her station to Esther. It has been well remarked, that the successive missions of Ezra and Nehemiah into Judea to relieve their countrymen and restore their ancient prosperity, is strong presumptive proof that they possessed a friend at the Persian court, and that kind of influence ascribed to Esther. See archbishop Usher's Annot. Vet. Test. Ann. Jul. per. 4193. Josephus, Art. lib. xi. chap. 6, &c.

AHASUERUS, is also a scripture name for Cambyses, the son of Cyrus, Ezra, iv. 6. ; and for Astyages, king of the Medes, Dan. ix. 1.

AHAVAH, a river in Assyria, on the banks of which Ezra, with his countrymen, observed a solemn fast, for direction in their return to Jerusalem. Ezra viii. 15—21.

AHAZ, אָחָז, Heb. i. e. possessing, the son of Jotham, king of Judah, succeeded his father, A. M. 3265, and during his short reign of sixteen years, proved to be one of the worst princes that had reigned in that state, from the first conversion of the commonwealth into a monarchy. The various judgments that followed his establishing idolatry, and abolishing the true religion; the repeated invasions of his kingdom by Pekah, king of Israel, and Rezin, king of Syria; the dreadful slaughter of 120,000 of his men in one day, the capture of 200,000 men, women and children, by these tyrants; with their restoration at the request of the prophet Oded; the ravages committed by the Edomites and Philistines; his bribing Tiglath-pileser with the gold of the temple to assist him against them, the consequent death of Rezin, and the destruction of his kingdom, with the other particulars of his unfortunate and infatuated reign, and his death, A. M.

3278, and A. A. C. 726, are recorded in 2 Kings xv. and xvi. 2 Chron. xxvii. and Isaiah vii.

AHAZIAH, אַחֲזִיאָה, Heb. i. e. the vision of the Lord, king of Israel, the son of Ahab and Jezebel, a foolish and wicked monarch, worthy of such parents. His imitation of their idolatrous example; his attempt to trade with Ophir, defeated by the destruction of his fleet; his mortal bruise by a fall from his balcony; his folly in sending to consult the oracle of Baalzebul; the severe reprimand and vengeance denounced by Elijah; his repeated messages to that prophet, with the destruction of two companies of his messengers, and his own death, in the second year of his reign, A. M. 3108, are narrated in 1 Kings xxii. 2 Kings i. and ii. Chron. xx.

AHAZIAH, king of Judah, the son and successor of Jehoram, by Athaliah the daughter of Ahab, came to the crown, A. M. 3119, and reigned only one year. During this short period, however, he gave sufficient evidence of his being more inclined to follow the bad example of his mother, and her idolatrous and bloody house, than the good one set by his paternal grandfather Jehoshaphat; but he was stopt in his career, and mortally wounded by Jehu, king of Israel, the avenger of the blood of Naboth.

AHEAD' On head. See HEAD. In advance; used chiefly of vessels on the water.

And now the mighty Centaur seems to lead;
And now the speedy Dolphin gets ahead.

Dryden's Æneid.

It is mightily the fault of parents, guardians, tutors, and governors, that so many men miscarry. They suffer them at first, to run ahead; and, when perverse inclinations are advanced into habits, there is no dealing with them.

L'Estrange's Fables.

A calm ensues; adjacent shores they dread,
The boats, with rowers mann'd, are sent ahead;
With cordage fastened to the lofty prow,
Aloof to sea the stately ship they tow.

Dryden.

AHEAD, in sea language, signifies not only farther onward than the ship, but at any distance before her, lying immediately on that point of the compass to which her stern is directed. It is used in opposition to astern, which expresses the situation of any object behind the ship. See ASTERN.

AHIAH, the son of Abitub, and great grandson of Eli, the high priest of Israel under king Saul.

AHIAH, the son of Sisha, and his brother Eliophoreh, were chief scribes, or secretaries of state, under king Solomon.

AHICCYATLI, in zoology, the name of an American serpent, approaching to the nature of the hemorrhus and rattle-snake, but larger than the former, and wanting the rattle of the latter. It is as fatal in the effects of its poison as any known species of serpent.

AHIEZER, אַחֵזֶר, i. e. a brother's help, a prince of the tribe of Dan, who was selected to assist Moses in numbering the Israelites.

AHIGH, } On high. See HIGH.

AHEIGHT, }

And so, some mounted vpon the walles, and

threw themselves from *ahyghé*, downe to the gronde, the more parte of whom dyed.

Nicoll's Thucydides, fol. 47. c. 2.

But have I fallen or no,—

—From the dread summit of this chalky bourne?
Look up *aheight!* the shrill-gorg'd lark so far,
Cannot be seen or heard.

King Lear.

AHIIJAH, an inhabitant of Shiloh, and an inspired prophet of Israel, who tore Jeroboam's new garment in twelve pieces, and gave him ten of them, as an emblem that the ten tribes, over which he foretold that Jeroboam should reign, would be rent from the house of David. He also foretold the death of Jeroboam's son, and wrote a history of the reign of Solomon, which is lost. He flourished about the year 3046.

AHIKAM, the son of Shaphan, and father of Gedaliah, the vice-roy of Jerusalem, under Nebuchadnezzar, a prince of Judah, who was one of those employed by king Josiah to consult Huldah the prophetess, and who, in the reign of his son Jehoiakim, protected and preserved the prophet Jeremiah.

AHIMAAZ, the son and successor of Zadok the high priest, a zealous friend of David in his adversity. His exertions along with Jonathan in favour of the old monarch, during the unnatural rebellion of his son; the imminent risk they both ran at Bahurim, from Absalom's party; with his anxious zeal to bring the earliest intelligence to David of the victory, are recorded in 2 Sam. xv. xvii. and xviii.

AHIMELECH, אַחִימְלֵךְ, i. e. a king's brother, the son of Ahitub, great grandson of Eli, and brother and successor of Ahia, high priest of Israel under Saul. His kindness to David, in giving him and his followers the shew-bread to eat, when he had no other, and the barbarous massacre, that followed, of him and eighty-four priests, by Doeg the Edomite, Saul's bloody informer, with the total extirpation of the whole inhabitants of his city Nob, not excepting the women, the children, or even the cattle, are mentioned in 1 Sam. xi. and xii. These bloody transactions, which happened about A. M. 2944, place the character of Saul in a worse point of view, than almost any other event of his whole unfortunate reign.

AHIMELECH, the son of Abiathar, by Saul's appointment, succeeded his name sake and predecessor as high priest, and acted as sagan, or second priest, in the end of David's reign.

AHINOAM, the daughter of Ahimaaz, and wife of king Saul.

AHINOAM of Jezreel, one of king David's wives.

AHITHOPIEL, אַחִתּוֹפֵל, Heb. i. e. a brother forsaken, a native of Giloh, one of king David's counsellors, and highly esteemed for his political sagacity. He was undoubtedly the Machiavell of his age, both for wisdom and wickedness. His advice to Absalom, who followed the wicked part of it, but left the wise part unaccomplished, together with the deserved tragical end of this disappointed politician, who is the first suicide recorded in history, are well known.

AHITUB, the son of Phineas, succeeded his grandfather Eli, as high priest of Israel.

AHIUS. See SALT-STONE.

AHLAB, a city of Canaan, from which the original inhabitants were not expelled by the Israelites; Judges i. 31.

AHLDEN, ALEN, or AHLEN, a town and bailiwick of Hanover, principality of Luneburg, situated on an arm of the river Leine, not far from the Aller. Long. 9°. 40'. E. Lat. 52°. 49'. N.

AHLEN, ALEN, or AALEN, in Suabia, once a free imperial town; but since 1802, the head of an upper bailiwick, in the kingdom of Wirtemberg, district of Ellwangen. It is seated on the Kocher, and not far from the town of Gemund: forty miles north-west of Augsburg. It contains 1930 inhabitants,

AHLWARDT, (P.) professor of logic and metaphysics at Grieswalde, was born in that place, Feb. 1716, and became a student of theology in 1727; but applied chiefly to mathematics and philosophy. In three years he removed to the university of Jena; and in 1732, returned to Grieswalde, where he read a course of lectures on his favourite studies. In 1743, he became an adjunct of the philosophical faculty, and nine years after was chosen professor; he also preached often with great approbation. Ahlwardt largely contributed to the critical researches of the society at Grieswalde, of which he was a member, and founded the order of the Abelites. His principal works are, Considerations on the Confession of Augsburgh; Thoughts on the Powers of the Human Understanding; An Introduction to Philosophy; A Treatise on the Immortality of the Soul; and Brontotheologia, or Thoughts on Thunder and Lightning. He is said, never to have corrected what he had once written. He died March 1, 1791.

AHMED (KHAN,) emperor of the Moguls in 1282, was of the race of Jenghis or Zingis, the son of Hulaku, and brother of Abaka khan, whom he succeeded. He assumed the name Ahmed, on his embracing Mahomedanism; and offered, on this occasion, protection to all Mussulmans. This change of religion offended the princes of his family to such a degree, that he could never regain their affection. His nephew Argun raised an army against him, but he was soon defeated and taken prisoner. He was afterwards released by some conspirators, and having killed the emperor's principal officers, he pursued and overtook him; and delivered him up to his mother-in-law, who, in revenge for the loss of her own sons whom Ahmed had caused to be slain, put him to death, after a reign of two years and two months, A. D. 1284. *Mod. Un. Hist.* vol. iv.

AHMEDABAD, the capital of the province of Gujerat in Hindostan: was founded by sultan Ahmed in the year 1409. It stands in long. 72°. 37'. E. and 23°. N. lat. on the banks of the river Sabermaty, which falls into the gulph of Cambay, near to the city of that name: was formerly famous for its manufacture of chintz, brocade, velvet, arms of various kinds, &c.; and is one of the best fortified cities in Hindostan. The walls are of brick and stone, flanked at certain distances with large round towers and battlements. It has twelve gates, and, including the suburbs, is about four miles and a half in length.

On the west is the castle, walled with free-stone, and almost a spacious city of itself. The caravansary is south of the King's square, which is 700 paces long and 400 broad.

Ahmedabad was taken by the English in the year 1780. On the conclusion of the peace in 1783, it was restored to its former possessors, the Poonah Mahrattas, under whom it still continues.

AHMEDNUGGAR, a city of Hindostan, in the province of Aurungabad, a modern division of the Decan. It belongs to the Paishwa, a dependent of the British empire, and was founded by Ahmed Nizam Shah, in 1493. Before the close of the century, this chieftain established an independent empire, which he called after the name of this city, and which continued in the dynasty of the founder until 1600, when the last prince of his race was seized, while an infant, by the Moguls, and the whole of his dominions in a few years became a province of the Mogul empire. On the death of Aurengzebe, it partook of the precarious fate of all the neighbouring provinces; but finally fell into the hands of the Mahratta Paishwa, from whom it was wrested by Dowlet Row Scindia, in 1797. The former prince having placed himself entirely under British protection, in 1801, the army of Fort St. George, headed by our immortal Wellington, then General Wellesley, advanced upon Poonah, to re-instate him in his sovereignty. The British were at this time at war with Holkar and Scindiah, and one of the first operations of the campaign of 1803 was the reduction of the fortress of Ahmednuggar, which led to the victories of Assaye and Argum, in the former of which Wellesley's army of 4,500 men, beat the allied forces of Scindiah, and the rajah of Nagpoor, amounting to 30,000 men. Ahmednuggar was replaced in the hands of the Paishwa in 1804, and commands the best entrance into his dominions, as well as into those of our neighbouring ally, the Nizam. It stands in N. Lat. 19°. 1'. and E. Long. 75°. 4'. 83 miles from Poonah, and 181 from Bombay.

AHMEDPORE, a town of Hindostan, in the province of Orissa, thirty-four miles south of Cuttack.

AHMELLA, in botany, a species of bidens, or water hemp agrimony. Its flowers are large, and resemble those of the marigold; growing in large numbers on the tops of the stalk, and large branches, and succeeded by oblong seeds, which have the same sort of points at one end with those of our common bidens. The stalks are square, and the leaves in pairs, in shape like those of the common nettle. We have one species of it very common in all parts of England, about watery places, and easily known by its seeds, in autumn, sticking to the clothes and stockings of those who go near the plant. This plant, and the others of the same genus, bear the name bidens, from the teeth or prickles at the ends of the seeds; but the word should be tridens, for there are certainly three of them.

AHMOOD, a town of Gujerat, belonging to the Mahrattas.

AHNA, a bailiwick of Germany, in lower Hesse, belonging to the elector of Hesse-Cassel.

AHRBERG, a bailiwick, market town, and castle in Germany, in the upper division of the bishopric of Eichstad; now in the Bavarian circle of the Rezat, district of Herrieden. Population 3300. The town is three miles S. W. of Ohrenbau.

AHRENFELS, a domain (formerly imperial) with a castle, lying on the Rhine, not far from Lintz, and belonging, till lately, to the house of Nassau-Usingen. Also a village, 17 miles N.N.W. of Coblenz.

AHU, in zoology, the ibex capensis of Kolben, the kevel of Buffon, the flat-horned antelope of Pennant, and the antelope kevella of Gmelin's Linnaeus.

AHUCYATLI, in natural history, an American serpent, approaching to the nature of the hemorhuis and rattle-snake, but larger than the former, and wanting the rattle of the latter; it is as fatal in the effects of its poison as any known species of serpent.

A-HULL, in sea language, the situation of a ship when all her sails are furled on account of the violence of the storm, and when, having lashed her helm on the lee side, she lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

AHUN, a town of France, in the department of Creuse, seated on the Creuse, eight miles S. E. of Gueret, and in the arrondissement of that name; thirty miles N. E. of Limoges, and fifty-five S. E. of Moulins. Long. 2°. 4'. E. lat. 46°. 5' N.

AIJUN'GRY, or HUN'GRY.

When any of the gheastes would have touched any thinge, it vanished sudainely awaie, and was turned to nothinge. And so, when their eies were ful, they put vp theire kniues and rose ahungred.

Jewel's Defence of the Apologie.

I am not a hungry, I thank you, forsooth.

Shakespeare's Merry Wives of Windsor.

And when he had fasted forty days and forty nights, he was afterward an hungred.

St. Matt. iv. 2.

AHUYS, a sea-port town of Sweden, small, but very strong by its situation. It is seated in the principality of Gothland, in the territory of Bleckingby, near the Baltic Sea, about eighteen miles from Christianstadt. Lon. 14°. 15'. E. Lat. 56°. 15'. N.

AHUZZATHI, the friend of Abimelech II. king of Gerar, and who, along with Phicol, accompanied him, to witness the alliance made between him and the patriarch Isaac.

AIWAS, AHUAZI, or HAVISA, a town of Persia, on the river Karoon or Karasu, in the province of Kuzistan. It was formerly a large and flourishing city, the capital of a province of the same name, and the wintering place of Artabanes, the last of the Parthian kings. Afterwards it seems to have been independent of the sophis of Persia, and governed by a descendant of Mahomet, who exercised the rights of sovereignty. It is now incorporated with the dominions of the same king, whose authority is acknowledged by most of the Persian provinces: but is a poor place, whose population does not exceed 600 or 700 souls. Close to the edge of the

river are the ruins of a spacious palace, whose walls consist of massy hewn stone. Distant forty-eight miles south of Shuster, or Suster, the capital of Kuzistan, and forty north of Bussorah. Long. 48°. 58'. E. Lat. 46°. 10'. N.

AI, in ancient geography, a town of Judea, N. from Jericho, called by Josephus *Aiva*, originally a kingdom of the Canaanites, before it was captured by Joshua. See vii. and viii. chapters of Joshua. Some critics pretend to find a discordance between the third verse of the eighth chapter, where 30,000 men are mentioned as 'sent away by night,' and the twelfth verse, where it is said, that 'Joshua took about 5000 men, and set them to lie in ambush.' But this difficulty is easily removed, either by supposing with Masius, that 5000 lay in wait, while 25,000 attacked the city; or with Calmet, and most other interpreters, that two bodies were placed in ambuscade, the one consisting of 25,000, and the other of 5000 men. Ai, being burnt upon this occasion, was rebuilt by the Benjamites, and long after this period, was taken by Senacherib. After the captivity, it was rebuilt a second time. Nehem. xi. 31.

AI, a city of the Ammonites, taken and plundered by the Chaldeans.

AIAIA, in ornithology, the name of a Brazilian bird, of the platea, or spoon-bill kind, called by the Portuguese colhorado. It is exactly of the same shape, and much of the same size, with the European spoon-bill, and its beak is in the same manner, broad at the end. It is of a pale, but very bright and shining flesh-colour on the back and wings; the other parts of its body are perfectly white. It is common upon the shores of rivers, and its flesh is well tasted.

AJACCIO. See AJAZZO.

AJALON, or **AJJALON**, a town of the tribe of Benjamin, about three miles east from Bethel, rendered memorable by Joshua's victory over the five Canaanitish kings in the adjacent valley and still more so, by the extraordinary circumstance attending it, of the miraculously lengthened day. Whether this was accomplished by an arrestment of the earth's motion round its own axis, or by that of the rays of light proceeding from the sun, and reflected from the moon, it is impossible to determine. But while each of these hypotheses are within the bounds of possibility, and do not, like transubstantiation, baffle the power of credulity itself to believe, those who are willing to give credit to divine revelation, and who believe, that he who established the laws of nature can alter or suspend them at his pleasure, will not readily listen to the scoffs of infidels against this miraculous interposition of divine power.

AJALON, or **AJJALON**, the name of three other cities in Palestine, viz. 1. a city of Dan, which stood between Timna and Bethshemesh, assigned to the Kohathites, though the Amorites kept possession of it long after. It was taken however by Uzziah, and retaken by the Philistines from Ahaz. 2. A city in the tribe of Ephraim, about two miles from Shechem. 3. A town of Benjamin, between Bethel on the north and Jerusalem on the south. 4. A town of Zebulon, whose situation is not precisely known.

AJAN, a coast and country of Africa, which has the river Quilmanci on the south ; the mountains from which that river springs, on the west ; Abyssinia, or Ethiopia, and the Straits of Babelmandel, on the north ; and the Eastern, or Indian Ocean, on the east. The coast abounds with all the necessaries of life, and has plenty of very good horses. The kings of Ajan are often at war with the Abyssinians ; and all the prisoners they take, they sell to the merchants of Cambaya, those of Aden, and other Arabs, who come to trade in their harbours, and give them in exchange, coloured cloths, glass beads, raisins, and dates ; for which they also take back, besides slaves, gold and ivory. The whole sea-coast, from Zanguebar, to the Straits of Babelmandel, is called the coast of Ajan ; and a considerable part of it the Desert coast.

AJANTIA, *Aavresia*, an annual feast, consecrated to Ajax, the son of Telamon, and observed with great solemnity in the island of Salamis, as well as in Attica : where, in memory of his valour, a bier was exposed, set out with a complete suit of armour.

AJAR'. On jar, i.e. on char, on the turn. A. S. *Lýpan* Acypan, to turn.

The leuis remanis vnsterif of thare place,
Na partie not furthe of reule, quhill por case
The piping wynd blaw vp the dure *on char*,
And drieu the leuis.

Douglas, b. iii. p. 83. *Aeneid*.

The mystic numbers in the cavern laid,
Are rang'd in order by the sacred maid ;
There they repose in ranks along the floor ;
At length a casual wind *unfolds* the door ;
The casual wind disorders the decrees,
And the loose fates are scatter'd by the breeze.

Pitt. Aeneid

So rumour says, who will believe,
But that they left the door *ajar*,
Where safe, and laughing in his sleeve,
He heard the distant din of war.

Gray's Long Story.

AIAS, or AJASSO, a sea-port of Asiatic Turkey, the ancient Issus, in the government of Marasch, standing in a bay of the Mediterranean, of the same name. It is thirty-six miles S.S.W. of Marasch, and twenty north of Scanderoon, and famous for its warm baths.

AJASSALUCK, the Turkish name for a village standing on or near the site of the ancient Ephesus. It occupies the side of a hill, at the top of which is a large mosque, broken aqueducts, and ruinous buildings, interspersed. Its name signifies the temple of the moon, and the whole place seems to have been built from the ruins of Ephesian grandeur. The seats of a theatre, or stadium, some bearing Greek letters, constitute the buttresses of the castle ; and over the arch of the gateway are sculptures of the most exquisite workmanship, supposed to represent incidents related in the Iliad. A long Greek inscription also is exhibited in the mosque ; and its marbles, together with the large granite columns supporting the roof, are the spoils of Ephesus. Many of the scattered structures, with square domes, have been baths, testifying a more numerous population, whose dwellings

have fallen to decay. Several circumstances combine in demonstrating the former importance of Ajassaluck, but its history is imperfectly known. It has flourished chiefly, if not solely, under the Mahomedans ; and its origin has been referred to the thirteenth century. Tamerlane encamped here, after subduing Smyrna in 1402 ; and the events recorded of Ephesus posterior to this date seem to relate to Ajassaluck, which is thirty-nine miles south of Smyrna, and two west of Ephesus.

AIATASTO, a river of Peru, in the province and government of Tucuman, having pasture on its banks, which feed about 40,000 cattle and 6000 horses.

AJAX Oiliades, in classical biography, one of the most celebrated of the Greek leaders, in the expedition against Troy, and the son of Oileus, a powerful chief of the Locrians. Homer ascribes to him agility, and promptitude in executing whatever he undertook ; and he is said to have excelled in the use of the bow and javelin. Horace is, by some commentators, supposed to refer to him, *Od. xv. lib. i. v. 19.* *Homer Odys. lib. iv. 502*, says,

Pope.
Impious he roar'd defiance to the gods,
To his own prowess all the glory gave.

He is said to have incurred the displeasure of the gods, by his violation of Cassandra, the daughter of Priam, in the sanctuary of Minerva, where she had taken refuge. Ajax, however, denied the fact, and imputed the charge to the artifice of Agamemnon, who wished to keep Cassandra for himself. In his return home, he and his whole fleet were wrecked by the vengeance of Minerva. Some say that he escaped ; and that in the moment of danger he exclaimed : 'In spite of the gods, I will escape.' *Homer ubi supra*, v. 504.

AJAX Telamonius, the son of Telamon, prince of Salamis, and one of the principal heroes of the Iliad, is by Homer represented as inferior only to Achilles in strength and valour, and as the chief bulwark of the Greeks, after the secession of that warrior. 'His character,' says Dr. Aikin, 'seems to be intended as the model of that steady agreeable courage which is ever at hand, when its exertions are wanted, and requires no aid of circumstances to excite its energy. He is the only hero, who neither asks nor receives the assistance of a deity.' Homer partly vindicates him from the charge of irreligion : for though he did not pray to Jupiter himself, when he prepared to engage the valiant Hector, he desired others to pray for him, either with a low voice, lest the Trojans should hear, or louder if they pleased ; 'for,' says he, 'I fear no person in the world.' *Iliad*, lib. vi. v. 194. When the arms of Achilles were adjudged by the Greek chieftains to his rival Ulysses, Ajax was bereaved of his understanding ; and first venting his rage against a flock of sheep, taking them to be Greeks, he then turned his sword against himself. Fable reports, that the flower called hyacinth sprung from his blood. The Greeks erected a noble monument to him on the promontory of Rhœtum. Pausanias says, lib. i. that one of their tribes bore the name of Ajax, and that the people of Salamis built a temple to

him. Herodotus, lib. viii. c. 64. c. 121, informs us that the whole country of Greece invoked him a little before the battle of Salamis, and dedicated to him, as part of the first-fruits due to the gods, one of the ships which they had taken from the Persians in that battle. Pausanias states, among other wonderful things, that the waves cast the arms of Achilles upon the tomb of Ajax, after the shipwreck of Ulysses. The fate of Ajax was the subject of several eminent tragedies. In his last exploit, when he was endeavouring to preserve and rescue the dead body of Patroclus, and when he was overwhelmed with a mist or darkness, which intercepted his view of the Grecian host, he made the following address to Jupiter, which has been much admired for its sublimity :

Lord of earth and air,

O king! O father! hear my humble pray'r :
Dispel this cloud, the light of heaven restore :
Give me to see, and Ajax asks no more :
If Greece must perish, we thy will obey,
But let us perish in the face of day.

Pope. *Iliad*, lib. xvii. v. 645, &c.

Dr. Aikin thus sums up his character : ‘Such is the Ajax of the *Iliad*; a hero (as far as so rude an age admits of heroism) in grain; tried and proved by every difficulty and danger; not the meteor of a day, but shining with equal lustre through the whole period of action; always in his place; resorted to on every emergency, and never in vain; not hurried along by idle bravado or enthusiastic ardour, but making utility the guide of his actions; finally, never yielding but when mortal assistance was unavailable, and when a heaven-born champion, with celestial aid, was necessary to turn the tide of fortune. He may then stand in the number of able and useful men, whose value is superior to their fame: a class of which there are in members in every profession and rank of life, and to whose assistance, the first-rate characters owe great part of their celebrity and success.’

AJAX, in Grecian antiquity, a furious kind of dance, in use among the Greeks; intended to represent the madness of that hero after his defeat by Ulysses, to whom the Greeks had given the preference in his contest for Achilles’ arms. Lucian, in his treatise of Dancing, speaks of dancing the Ajax.

AJAZZO, or AJACCIO, the capital, formerly, of one of the five provinces of the division of the island of Corsica, called Di la da Monte, is the chief town in this island, the seat of the existing administrative offices, and the head of an arrondissement. It is the best built town on the island, being walled and protected by a citadel; and is delightfully situated on the north side of the Golfo d’Ajaccio, which forms a secure and commodious harbour for ships of the largest size; having a strong mole, but the entrance is rendered somewhat dangerous by a small projecting rock. The number of inhabitants in the town and suburbs, which stretch along the harbour, was in 1815, 6845, having increased rapidly during the present century, in consequence chiefly of the encouragement given to settlers by the French government, who spared no pains on its improvement, and embellishment. It is remarkable for

being the birth place of Napoleon Buonaparte. Long. 8°. 53'. E. lat. 41°. 46' N.

AICHI, a town of Germany, in Bavaria, seated on the river Par. It was taken by the Swedes, in 1634, and some time after reduced to ashes.

AICHMALOTARCHA. See AECHMALOTARCHA.

AICHSTAET, a town of Germany, in Franconia, and the ancient capital of a bishopric of the same name. It contains several hospitals, a cathedral and other churches, one of which is built after the model of the church called the Holy Sepulchre at Jerusalem; and is remarkable for a curious piece of workmanship, called the Sun of the Holy Sacrament.

AICHLSTETTEN, a town of Bavaria, in Suabia; containing 1380 inhabitants.

AICURUS, in ornithology, a species of parrot. See PSITTACUS.

AID ^{v. & n.}	Ad: <i>jupo, jutum</i> : Fr. <i>aider</i> ,
AID'ANCE,	a contraction of the foregoing
AID'ANT,	Latin word; to help; to carry
AID'ER,) a burthen; to assist.
AID'LESS.	

And in the ayd of Turnus and supple,
Ane thousand feirs folkis assemblit he.

Douglas, b. 7. p. 234.

Also thou shalt not swere for envie, neyther for favour, ne for mede, but only for righwisenesse and for declaring of trouthe to the honour and worship of God, and to the aiding and helping of thin even Cristen. Chaucer. *The Persones Tale*, v. ii. p. 333.

Into the lake he leapt, his lord to aid;
And, of him catching hold, him strongly staid
From drowning. Fairy Queen.

Neither shall they give any thing unto them, that make war upon them, or aid them with victuals, weapons, money, or ships. Maccabees viii. 26.

All along, as he went, were punished the adherents and aiders of the late rebels.

Bacon's *Henry VII*.

Oft have I seen a timely parted ghost,
Of ashy semblance, meagre, pale, and bloodless,
Being all descended to the lub'ring heart:
Who, in the conflict that it holds with death,
Attracts the same, for aidance 'gainst the enemy.

Shakespeare's *Henry VI*.

He had met

Already, ere my best speed could prevent,
The aidless innocent lady, his wish'd prey.

Milton's *Comus*.

She can unlock
The clasping charm, and thaw the mumming spell,
If she be right invok'd in warbled song;
For maidenhood she loves, and will be swift
To aid a virgin, such as was herself.

Comus.

BOAB. Advise, or aid, but do not pity me;
No monarch born can fall to that degree;
Pity descends from kings to all below;
But can, no more than fountains, upward flow.

Dryden's *Conquest of Granada*, Part 1.

—To Turnus' aid,

A thousand men the youthful hero led. Dryden.
The memory of useful things may receive considerable aid, if they are thrown into verses.

Watts's *Improvement of the Mind*.

A golden coffer in her hand she bore,

The present treacherous, but the bearer more.

'Twas fraught with pangs; for Jove ordain'd above,
That gold should aid, and pangs attend on love.

Parnell's *Heirod*.

AID, in ancient customs, a subsidy paid by vassals to their lords on certain occasions. Such were the aids of relief, paid upon the death of the lord mesne to his heir; the *aid cheval*, or capital aid, due to the chief lord on several occasions, as, to make his eldest son a knight, to make up a portion for marrying his daughter, &c.

AIR, in the menage, is the same with what some writers call *cherishing*, and used to avoid the necessity of correction.—The inner heel, inner leg, inner rein, &c. are called *inner aids*; as the outer heel, outer leg, outer rein, &c. are called *outer aids*.

AIR, in theology; the aids or assistances of divine favour, which are offered to man, have been the subject of much dispute betwixt the Jansenists and Jesuits; for the composing whereof a celebrated congregation was erected at Rome, under the title of congregation of aids, *congregatio de auxiliis*.

AIR, *ROYAL*, is a name sometimes given formerly to the land-tax.

AIDAB, or **GAI'DHAB**, a town on the confines of Abyssinia in Africa, opposite to Giodda, from whence, great numbers of Africans take shipping to visit Mecca.

AIDAN, a famous Scotch bishop, of Landafarne, or Holy Island, in the seventh century, was employed by Oswald, king of Northumberland, in the conversion of the English, in which he was very successful. He died in 651. We have an extraordinary instance of this bishop's liberality to the poor. Having received a present from king Oswin of a fine horse and rich housings, he met with a beggar, and dismounting, gave him the horse thus caparisoned. When the king expressed some displeasure at this singular act of humanity, and the slight put upon his favour, Aidan quaintly, but forcibly asked, 'which do you value most, the son of a mare or a son of God?' Bede describes the character of Aidan in terms of high commendation, and ascribes to him miracles, which the credulity of the times in which he lived would be disposed to admit. To the report of one of his miracles we are inclined to give our assent. When the bishop gave the priest, who was to conduct the betrothed wife of Oswi by sea to Northumberland, a phial of holy oil, instructing him, in case of a storm, to pour it into the sea, and assuring him that it would soon become calm, it is possible he might not be unacquainted with the efficacy of oil thus applied; which has been long known, and is now sufficiently established by observation and experiment.—*Biog. Brit.*

AID-DE-CAMP, in military affairs, an officer employed to receive and carry the orders of a general.

AIDERBEITZAN, *Aderbijan*, or, as the Persians call it, *Azerbeyan*, in geography, a province of Persia, adjoining east on the province of Ghilan, the Caspian Sea and Tabristan, to the south on Irac-Ajemi, to the west and north-west upon Kurdistan and Upper Armenia, and to the north on Schirwan and Georgia. The etymology of the name imports a country of fire; and it is so called on account of the temple erected in it for keeping their sacred fire. The soil is fruitful, and the climate healthy,

though cold. The most considerable cities in it are Tauris, Ardevil, and Sultania. The province extends from about N. lat. 36°. to 39°. and from E. long. 48°. to 54°.

AID-MAJOR, or **ADJUTANT**, in military affairs, is an officer, whose business is to ease the major of part of his duty; and to perform it all in his absence. Some majors have several aid-majors.—Each troop of guards has but one major, who has two aid-majors, as it contains battalions.—When the battalion is drawn up, the aid-major's post is on the left, beyond all the captains, and behind the lieutenant-colonel.

AIDIN, a district of Asiatic Turkey, of which the city of **SMYRNA** is the capital, which see.

AIDON, *Aidon*, ancient British or Welsh, the wing of an army, a castle in Northumberland, where Camden supposes there was a station of the Roman army, under Julius Caesar.

AIDONEUS, in fabulous history, a king of the Molossians, who imprisoned Theseus, for attempting to steal his daughter Proserpine, near the river Acheron; whence the poetical fable of Theseus's descent into hell.

AIEREBA, in ichthyology, the name of a fish of the pastinacha marina kind, but differing from all the others, in that the form of its body is regularly round, and its head placed far within the verge of its thin part. It is common in the Western Ocean: but is not much esteemed for the table, being more loose in its flesh than the other kinds.

AIGHENDALE, the name of a liquid measure used in Lancashire, containing seven quarts.

AIG'LET, or **AGLET**, Fr. *aiguillette*, the tag of a

Ac'LET. lace, or of the points formerly used in dress; sometimes formed into small figures; spangles, &c.

He gyueth alwaye hys old point **at**, one end or other some new **aglet**; but when al his cost is don theron, it is not al worth an **aglet** of a good blewe poynete. *Sir Thos. More's Works*, p. 675. c. 2.

It all above besprinkled was throughout
With golden **cigdet**, that glister'd bright,
Like twinkling stars; and all the skirt about,
Was hemm'd with golden fringes.

Faerie Queene.

He thereupon gave for the garter a chain worth 200l. and his gown addressed with **aglets**, esteemed worth 25l. *Mayward.*

Why, give him gold enough, and marry him to a puppet, or an **aglet** baby, or an old trot, and ne'er a tooth in her head. *Shaksp. Taming of the Shrew.*

AIGILULF, **AIGILULFUS**, a king of the Lombards, who took Ravenna, and put an end to the exarchate, A. D. 752, after it had lasted 171 years.

AIGITHIALUS, *αιγιθαλος*, in ornithology, a name by which some old authors call the parus or titmouse.

AIGLE, or **AELEN**, a district in the Swiss canton of Vaud, (formerly in that of Berne,) with the title of a government. It lies east of the lake of Geneva, was anciently reckoned in the Pays de Vaud, and belonged to the dukes of Savoy. Through this district lies the great road from Vallais into Italy, by Villeneuve, which is at the head of the lake of Geneva, through a deep valley, three miles wide, bordered on one side with the Alps of Switzerland, and on the other

with those of Savoy, and crossed by the river Rhone. It passes through the town of Aigle. See next article. Ivorna, in the district of Aigle, was in part buried by the fall of a mountain, occasioned by an earthquake in 1584.

AIGLE, a large thriving town in the canton of Berne, seated on the banks of the Rhone, six miles from its entrance into the lake of Geneva, is surrounded with vineyards, fields, and meadows. The houses are built of a white marble, found in the neighbourhood. The governor's castle is on an eminence, above the town, and has a lofty marble tower, inhabitants 2500. It is twenty-six miles north-east of Geneva.

AIGLE, a lofty promontory on the coast of Provence, in France, between Marseilles and Toulon. Also a town on the river Rille, in Lower Normandy, the head of a canton in the department of the Orne, arrondissement of Mortagne. 14 leagues N. E. of Alençon.

AIGLE, or EGRE, is likewise a small river of France, in the department of the Loir and Cher, which falls into the Loir.—Also a small island in the St. Lawrence, formed by the confluence with that river of the Riviere des Prairies, which bounds the southern shore of the island of Montreal. It is mostly good meadow land.

AIGLETTE, in heraldry. See EAGLET.

AIGNAN, or AGNAN, a town of France, in the department of the Gers, arrondissement of Mirande. It has a population of 2610, and lies on the river Midou.

AIGNAN (St.), a small town of France, below the conflux of the Saudre and Cher, in the department of the Loir and Cher. It is 8 leagues south of Blois, and 47 S. S. W. of Paris.

AIGNAN, St. an uninhabited island in the South Pacific; one of those denominated the Archipelago of Louisiade by the French. It rises from a precipitous coast on the north into woody mountains; the eastern extremity is in Lon. 152°. 56'. 30". E. Lat. 10°. 41'. 19". S.

AIGNAN, (M.) a modern French author of some celebrity, who died in Paris, in the beginning of 1825. He has enriched the French language with a new translation of Homer, which some critics consider very similar in character with that of Pope, in our own tongue—elegant as a composition, rather than an accurate transcript of his author's meaning. He wrote also the tragedy of 'Brunehaut,' once very popular; was the editor of a provincial review, called, Bibliothèque Etrangere, which contains some curious learning; and furnished, on the coronation of Napoleon, a letter-press description of the plates engraved to illustrate that ceremony.

AIGRE, a town of France, formerly in the Angoumois, diocese of Saintes, intendancy of La Rochelle, now the head of a canton, in the department of the Charente, arrondissement of Rufec. Inhabitants 1430. It is 7 leagues N.W. of Angouleme.

AIGRE-FEUILLE, a small town of France, the head of a canton, in the department of the Lower Charente, arrondissement of Rochefort, two leagues and three-quarters E.S.E. of La Rochelle. Likewise the name of several villages in Brittany and Languedoc.

Vol. I.

AIGRETTA, in ornithology, the name of a species of heron, which seems to be a synonyme of the ardea alba minor, or the small white heron.

AIGUE MARINE. See AQUA MARINA.

AIGUE-PERSE, a town of France, in Auvergne, the head of a canton, in the department of Puy de Dome, near which there is a very cold spring, which bubbles up with a strong effulgence, and is fatal to animals that drink it. It lies 18 miles N. of Clermont, and 25 S. of Paris, in the arrondissement of Riom. Inhabitants, 5050.

AIGUES-MORTES, a town of France, in Lower Languedoc, in the department of the Gard, arrondissement of Nismes. It formerly stood near the sea, which has retired two leagues from the town, leaving it in a morass, which, however, serves as a defence for it. It is 7 leagues S.S.W. of Nismes.

AIGUES-VIVES, a town of France, in the department of the Gard, 4 leagues S. W. of Nismes. Also a town of France, in the province of Touraine, not far from the Cher; now in the department of the Indre and Loir.

AIGUILLON, a town of France, situated at the conflux of the Lot and Garonne, in the department of the Lot and Garonne, contains 2380 inhabitants. Five leagues and a half N.W. of Agen.

AIGUISCE, in heraldry, denotes a cross with its four ends sharpened, but so as to terminate in obtuse angles.—It differs from the cross fitchee, in as much as the latter tapers by degrees to a point, and the former only at the ends.

AIKIN, (John, M. D.) a modern author, and editor of various useful works, was born 15th of January, 1747, at Kibworth, Leicestershire, being the only son of Dr. T. Aikin, a dissenting minister, and master of a respectable academy at that place. He received the rudiments of his education at home; but was sent early to the Dissenters' academy at Warrington, which was then in considerable repute.

Mr. Aikin evincing a taste for medical pursuits, was first articled to the late Dr. Garthshore, then a practising surgeon and apothecary, at Uppingham, in the county of Rutland. He became a member of the University of Edinburgh, in 1764, where he continued for two years; and after passing three years more as a pupil to Mr. White, of Manchester, settled as a surgeon in Chester; but soon removed to Warrington. In this place he began his career as an author, by publishing several miscellaneous pieces in conjunction with his sister, Mrs. Barbauld; and an excellent translation of Tacitus's *De moribus Germanorum*; and *Life of Agricola*. Here also commenced his friendship with Dr. Priestley, and with Gilbert Wakefield, both of whom were then connected with the Warrington academy.

In 1784, Mr. Aikin proceeded to Leyden, where he graduated as a physician; in which capacity, he soon after settled at Yarmouth, in Norfolk. Dr. Aikin throughout life, was distinguished for the liberality of his opinions, as well as the candour and fearlessness with which he professed them. Joining at this time in the strenuous efforts of his fellow dissenters, to obtain a repeal of the corporation and test acts, he ex-

cited considerable jealousy in the high church party of the place; which was increased, by his becoming the advocate of the early measures of the French revolutionists. Our author is said to have been finally compelled to leave Yarmouth upon these grounds. In 1796, Mr. now Sir Richard Philips, engaged him to conduct the *Monthly Magazine*; of which he was the sole editor for ten years. The volumes published under his superintendence, contain numerous striking proofs of his talents as an essay-writer. During this engagement he projected, in conjunction with Dr. Enfield, a General Biographical Dictionary, which was continued at various intervals of publication, to the extent of ten volumes quarto. The first volume appearing in 1799, and the last in 1815. Dr. Aikin also conducted for Messrs. Longmans a superior magazine, (but of short-lived success,) called the 'Atheneum.' He was also the author of a life of Huet, bishop of Avranches; and of a volume of Medical Biography, 8vo. He likewise edited for the booksellers in 1806, a superior edition of Spenser, 6 vols. 8vo.; bishop Newton's Works of Milton, with a prefatory critical essay, which passed through three editions; and, a volume that fully justified its title, called Select Works of the British Poets, comprising a chronological series of our classical poets, from Ben Jonson to Beattie, without mutilation or abridgment. 'The contents are so comprehensive, that few poems, it is believed, are omitted; except such as are of a secondary merit, or unsuited to the perusal of youth.' Dr. Aikin died at Stoke Newington, Dec. 7, 1822, in the seventy-fifth year of his age.

AIKMAN, (William,) in biography, a painter of eminence, the son of William Aikman, Esq. advocate of Cairney in Scotland. He was born October 24th, 1682, and intended by his father, for his own profession; but devoted himself to the fine arts, and particularly to that of painting. In 1707, he went to Italy; and having resided for three years at Rome, passed to Constantinople and Smyrna, and in 1712 returned to his own country. Here he followed the profession of painting under the patronage of the duke of Argyle, the earl of Burlington, Sir Godfrey Kneller, and other patrons of the arts. For the earl of Burlington he painted a large picture of the royal family, now in the possession of the duke of Devonshire, which his death prevented his finishing; and there are several portraits painted by him in Scotland, which are now in the possession of the duke of Argyle, the duke of Hamilton. &c. Mr. Aikman died in London, June 4th, 1731; having lost his son about six months before, at the age of seventeen. Amongst his intimate friends were Somerville, the well-known author of the Chase, Mallet, Mr. Allan Ramsay, and the celebrated author of the Seasons, each of whom paid an elegiac tribute to his memory. A very neat epitaph by Mallet was engraven on his tomb.

Thomson's poem on the death of Mr. Aikman, contains the following beautiful lines:

A friend, when dead, is but removed from sight,
Sunk in the lustre of eternal light;
And when the parting storms of life are o'er,
May yet rejoin us on a happier shore.

As those we love decay, we die in part;
String after string is sever'd from the heart,
Till loosen'd life at last but breathing clay,
Without one pang is glad to fall away,
Unhappy he, who latest feels the blow
Whose eyes have wept o'er every friend laid low;
Dragg'd ling'ring on from partial death to death,
Till dying, all he can resign is breath.

AIL', v. & n. } A. S. Aislian, to be sick ;
AIL'MENT. } to pain; to trouble; to affect
in any manner.

And the angel of God called to Hagar out of heaven, and said unto her, What *aileth* thee, Hagar? fear not, for God hath heard the voice of the lad, where he is.

Gen. xxi. 17.

Love smiled, and thus said, 'Want, joined to desire, is unhappy; but, if he nought do desire, what can Heraclitus ail?' *Sidney.*

What *ails* me, that I cannot lose thy thought!

Command the empress hither to be brought:
I, in her death shall some diversion find;

And rid my thoughts at once, of woman-kind.

Dryden's Tyrannick Love.

Little ailments oft attend the fair,
Not decent for a husband's eye or ear.

Granville

AILAH, a small but ancient town of Asia, in Arabia Petraea, seated on the east side of one of the north bays of the Red Sea, near the Sinus Elanites. It is supposed to be the place called Elath and Eloth in Scripture. It lies near the road, which the pilgrims travel, from Egypt to Mecca. Long. 36°. 40'. E. Lat. 29°. 10'. N.

AILANAH, AILATH, or AHELOTH. See last article.

AILE, or AIEL, from *aicul*, Fr. grand-father, in law, a writ which lies where the grand-father, or great-grandfather, called befaile, was seized in lands or tenements in fee simple, on the day he died; and a stranger abates or enters the same day, and dispossesses the heir or grandchild. See ABATEMENT.

AILERONS, in natural history, petty wings, a French term, expressing two small fleshy substances, resembling part of wings, or young and just growing wings, and found in the two-winged flies, situated at the root of the larger wings. It is a diminutive of the French *aille*, wing.

AILLESBURY, or AYLESBURY, an ancient borough and market town of Buckinghamshire, eighteen miles from Buckingham, and thirty-nine from London. It is the *Eglesbury* of the Saxons; and was a well fortified British town, maintaining its independence against the incursions of the Saxon invaders, till reduced by Cuthwolf, brother to Cealwin, king of the West Saxons, in the year 571. St. Osyth, who was beheaded by the Pagans in Essex, was buried at this place, about the year 600; and numerous miracles were believed to have been wrought by her relics in the church here; on which account a religious house was erected to her memory. Camden, speaking of this town, says, that it was bequeathed by Frewald to his daughter Editha; but to whom it descended from this pious lady does not appear. Subsequently, however, it became a royal manor; and William the Conqueror, invested his favourites with some of its lands, under the tenure of providing 'straw for his bed chamber; three eels for his use in winter;

and in summer, straw, rushes, and two green geese, thrice every year, if he should visit Ailesbury so often.' In the reign of this monarch, the manor of Ailesbury was purchased by Sir John Baldwin, chief justice of the Court of Common Pleas, whose daughter having been married to one of the Packingtons, this manor came into that family, and has regularly descended in it to the present time. Drayton says,

Aylesbury's a vale that walloweth in her wealth,
And (by her wholesome air, continually in health)
Is lusty, firm, and fat; and holds her youthful strength.

Fuller, in his *Worthies of England*, states, that 'the best, and biggest-bodied sheep in England, are in the Vale of Ailesbury, where it is nothing to give ten pounds or more for a breed-ram. So that, should a forrainer hear of the price thereof, he would guess the ram rather to be some Roman engine of battery, than the creature commonly so called.' In Leland's time the houses were of timber, but now they are mostly of brick. Here is a county gaol, and the Lent assizes are held here. Ailesbury consists of several irregular streets, containing altogether about 16,671 inhabitants. The county hall is a handsome modern fabric, and the church a very ancient and spacious edifice. It was made prebendal to the see of Lincoln by William the First. The town was incorporated by royal charter, and empowered to return two members to Parliament in 1553. In the Rolls chapel, among the writs for the parliamentary returns, in the 14th Eliz. is a curious document, addressed by 'Dame Dorothy Packington, late wife of Sir John Packington, Kt., lord and owner of the town of Ailesbury,' to 'all Christian people, &c.' stating, that she had 'chosen, named, and appointed her trusty and well-beloved Thomas Litchfield and George Burden, Esqrs., to be her burgesses of her said town of Aylesbury;' and further stating, that whatever the said Thomas and George should 'do in the service of the Queen's Highness, in that present parliament,' &c. 'she did ratify and approve to be of her own act, as fully and wholly as if she were witness or present there!' On first receiving the privileges of a borough, the electors of Ailesbury were confined to the bailiff, nine aldermen, and twelve burgesses; but this charter being lost through neglect, the elective franchise was extended to all householders not receiving alms; who amounted to between 300 and 400. This privilege also having been abused and corrupted, in the year 1804 a bill was brought into parliament for still further extending the right of election to the three adjoining hundreds; so that the number of voters are now nearly tripled. Besides the church, already mentioned, there are various places of worship for several denominations of Protestant Dissenters. During the late exile of the royal family of France, Louis XVIII., with various members of his family, resided some years at Hartwell, about two miles from this town; and here his consort, Marie Josephine Louise de Svoie, comtesse de Lille, died on the 13th Nov. 1810, in her 58th year. Ailesbury gives the title of earl to the Brudenel family. Markets on Saturday.

AILESFORD, Eaglesford, Sax. the eagle's ford, a town in Kent, famous for the great victory obtained by Vortimer, the British king, over Hengist and his Saxon army.

AILES VITREES, in natural history, a French term used to express the wings of a series of insects, which seem of a middle nature, between the fly and the butterfly kind, and are therefore called papilion mouches by these writers. The wings of these insects are in part covered with dust, or scales, and in part free from it, and transparent. In these free parts they look glassy; whence their name, signifying glassy wings.

AILMER, or **ÆTHELMARE**, earl of Cornwall and Devonshire, in the reign of king Edgar. It is not known of what family he was. His authority and riches were great, and so also in appearance was his piety. He founded the abbey of Cerne, in Dorsetshire. In 1016, when Canute invaded England, and found himself stoutly opposed by Edmund Ironside, this earl Ailmer, with Eadric Streone, earl of Mercia, and earl Algar, joined the Dane against their natural prince, which was one great cause of the ruin of the Saxons.

AILRED, **EALRED**, abbot of Revesby in Lincolnshire, in the reigns of Stephen and Henry II., was born in 1109, of a noble family, and educated in Scotland with Henry the son of king David. On his return to England, he became Cistercian monk in the monastery of Revesby, of which he afterwards was made abbot. He died in 1166, aged fifty-seven, and was buried in his monastery. 'He was,' says Leland, 'in great esteem during his life; celebrated for the miracles wrought after his death; and admitted into the catalogue of saints.' He was author of several works; most of which were published by Gilbo the Jesuit at Douay, 1631; part of them may be also found in the *Bibliotheca Cisterciensis*, and *Bibliotheca Patrum*. His principal work is *Speculum Charitatis*.

AILSA, an insulated rock on the western coast of Scotland, between the shores of Ayrshire and Cantyre. It is two miles in circumference at the base, is accessible only at one place, and rises to a great height in a pyramidal form. A few goats and rabbits pick up a subsistence among the short grass and furze; but the importance of the rock consists in the great variety and boundless numbers of birds, by which it is frequented; particularly the gannets or solan geese, whose young are used at the best tables, and bring a good price. Other birds are caught for their feathers. The rock is rented from the Earl of Cassilis. The depth of water around the base is from seven to forty-eight fathoms. It is surrounded with excellent banks, well stocked with cod and other white fish. An ancient castle surmounts this rock, which is useful as a sea mark, in W. Long. $5^{\circ} 8'$. N. Lat. $55^{\circ} 18'$.

AIM' v. & n. { Old Fr. *esme*, to point at.

AIM'LESS. { —*Cotgrave* and *Skinner*.—*amyer*, presenter, dresser.—*Ducange*.—Perhaps from the Gothic *haim*, home, primarily, then to direct a missile weapon to a point; to have an immediate object in view, to which the attention is particularly directed.

Then Turnus aiming long in hand a dart of sturdy oke,
Well tipt with steele, at Pallas forth it flung, and
and thus he spake,

Lo, see if that our dart be sharper than thy weapon
was. *Aeneidos, Book 11, by Phae & Tuyne.*

Lo, here the world is bliss; so here the end,

To which all men do aim, rich to be made;
Such grace now, to be happy, is before thee laid.

Faerie Queene.

It is impossible, by aim to fell it; and for experience and knowledge thereof, I do not think that, there was any of the particulars thereof.

Spenser on Ireland.

There is a history in all men's lives,
Figuring the nature of the times deceas'd:
The which observ'd, a man may prophesy
With a near aim, of the main chance of things,
As yet not come to life; which, in their seeds
And weak beginnings, lie intreasured.

Shakspeare's Henry VI.

Another kind there is, which although we desire for itself, as health, and virtue, and knowledge; nevertheless, they are not the last mark, whereat we aim, but have their further end, whereto they are referred.

Hooker.

He trusted to have equall'd the Most High,
If he oppos'd: and with ambitious aim,
Against the throne and monarchy of God,
Rais'd impious war. *Paradise Lost.*
But see, how oft ambitious aims are crost;
And chiefs contend, till all the pride is lost.

Pope.

Aim'st thou at princes, all amaz'd they said,
The last of games? *Pope's Odyssey.*

Ascanius, young and eager of his game,
Soon bent his bow, uncertain of his aim;
But the dire fiend the fatal arrow guides,
Which pierc'd his bowels through his panting sides.

Dryden, En. vii. l. 621.

AIMARAFEZ, a province of Peru, bounded by that of Andahuailas, on the north-west and west, on the south by Parinacochas, on the south-east by Chumbivilcas, and east by Cotabamba. It is 120 miles from north to south, and 26 miles from east to west. Its surface is full of lofty ridges and snowy summits, and on this account the climate is generally cold, with the exception of some valleys, where the land produces abundantly, sugar, cattle, and grain. It is intersected by three rivers, of little use on account of the lowness of their beds, but which afterwards unite, and form the l'achachaca. There are innumerable veins of gold and silver in the province, which are not worked. Some mines of quicksilver, which have been discovered, have been forbid to be wrought. The number of inhabitants in the province amounts to 15,000. The yearly tribute formerly received by the corregidor used to be 800,000 dollars. The jurisdiction contains fifty settlements.

AIMARGUES, a town of France, in the department of the Gard, five leagues from Nismes Number of houses 400, inhabitants 1800.

AJMEER, or RAJPOOTANA. See AGI MEER.

AIN, a river of France, giving name to the department of the Ain, and which, rising at the foot of Mount Jura, falls into the Rhone above Lyons.

AIN, a department of France, formed out of the ancient districts of Bresse, Bugey, and a part of Burgundy. It is enclosed by Savoy,

Switzerland, and the departments of the Isere; the Rhone and Loire, the Saone and Loire, and finally of Jura, and extends about twenty-two leagues from east to west, and seventeen from north to south; the number of square leagues is 290. It is divided into the four arrondissements of Bourg, Nantua, Belley, and Trevoux, and contained, according to the most recent returns to the board of statistics at Paris, 322,608 inhabitants.

AIN, a town in the pachalic of Bagdad, ninety miles west of Bussorah.

AINA, the name given by Josephus to Ai, which see.

AINOS, or AINUS, sometimes called also Wild Kuriles, the aborigines of Jesso, and Saghalin. See JESSO.

AINIMOSA, a large and opulent town, in the N.E. of Wallachia, N.W. of Tergovitz.

AINOID, a splendid castle and lordship, on the river Gurk, in Carniola, 5 miles N.W. of Rudolfswerth.

AINSA, a town of Spain, in the principality of Sorbrage, and kingdom of Arragon, seated in a plain, on the river Cinca.

AINSWORTH, (Dr. Henry,) an eminent nonconformist divine, who, about the year 1590, distinguished himself among the Brownists, which drew upon him such troubles, that he retired to Holland, and became minister of a church at Amsterdam. His skill in the Hebrew language, and his excellent Annotations on the Holy Scriptures, which are still highly esteemed, gained him great reputation. He also wrote several pieces in defence of the Brownists, (to which bishop Hall replied,) with other works. The circumstances that occasioned his death, are somewhat extraordinary, and deserve to be mentioned. Having found a diamond of great value in the streets of Amsterdam, he advertised it; and when the owner, who was a Jew, came to demand it, he offered him any acknowledgment which he would desire. Ainsworth, though poor, would accept of no remuneration but a conference with some of the Jewish rabbies, upon the prophecies of the Old Testament relating to the Messiah, which the Jew promised; but not having interest sufficient to obtain it, through shame or vexation, or from some other motive, he is said to have poisoned Ainsworth. This event happened about the year 1629.

AINSWORTH, (Robert,) born at Woodyale, in Lancashire, 1660, was master of a boarding-school at Bethnal-Green, whence he removed to Hackney, and other places in the neighbourhood of London. After acquiring a moderate fortune, he retired, and lived privately till 1743, when he died. We are indebted to him for the best Latin and English Dictionary extant: he published it in 1736; and in 1752, the fourth edition, under the care of Dr. Ward, of Gresham College, and the Rev. William Younge, was enlarged to two vols. folio. It has been since published in quarto and octavo, with various improvements

INTAB. See ANTAB.

AJOVEA, in botany, a genus of the hexandria monogynia class and order; the characters of which are: CAL. single-leaved and tridentated; COR. three petals, the filaments terminated with

two glandules, the antheræ doubly excavated; STIG. divided into six segments, and the fruit a roundish, single-celled, monospermous berry. There is one species, viz. A Guianensis; which grows in the forests of Guiana.

AIOU, a group of sixteen islands, in the Eastern seas, off the north coast of Waygion, and surrounded by a reef fifty miles in compass, which is penetrated by a deep channel on the north-west side.

AIOU BABAB, is the largest about five miles in circuit, and 500 feet high, and lies in 128°. 25'.

E. Long. and 0°. 32'. N. Lat. Tropical fruits and roots are produced here; and the inhabitants obtain abundance of fish and turtle. They procure sago from Waygion and Rawak; and sell tortoise-shell and biche de mer, (an animal of the mollusca tribe, much sought for in the Eastern seas,) to the Chinese.

AIPIXIMIRA, in ichthyology, the name of an American fish, more usually known by the name of pudiano. It is small, of the shape of a pearl, with a purple back, and yellow sides and belly.

A I R.

AIR, v. & n.

A'RIAL,
A'RIE,
AIR'NESS,
AIR'ING,
AIR'LESS,
AIR'LING,
AIR'Y.

Gr. *ἀηρ*, *ἀημι*, to breathe.—Fr. *air*.—The noun designates the fluid which constitutes our atmosphere, and which surrounds or penetrates all substances with which we are conversant; it is variously combined and modified, and is necessary to animal life. The different significations of the root and its derivations, are deduced from the attributes of the air; hence, when its motion is forcible, it is the wind.

The adjectives mostly refer to that which is light, gay, and unsteady. Through the medium of the French and Italian tongues, air signifies the carriage or deportment of a person; sound in music and poetry; airy, is the eagle's nest, so called from its aerial situation.

Lyke as when an arowe is shott at a mark, it parteth the ayre, which immediatly commeth together agayne, so that a man can not knowe where it wete thorow.

Bible, 1539. *Wysdome*, c. v.

For Jupiter had from the heuynnis fare,
Send down Iris, quihilk duellis in the *are*
Unto his spous and sister thare at hand,
Ful scharp chargis bringis and command.

Douglas, b. ix. p. 307.

Joy'd to range abroad in fresh attire,
Thro' the wide compass of the *airy* coast.

Spenser.

There be many good and healthful *airs*, that do appear by habitation and other proofs; that differ not in smell from other *airs*.

Bacon's Natural History, No. 904.

The first is the transmission, or emission of the thinner and more *airy* parts of bodies; as in odours and infections; and this is of all the rest, the most corporeal.

Bacon.

Our *airy* buildeth in the cedar's top,
And dallies with the wind and scorns the sun.

Richard III.

He is that merry and *airy* at shore, when he sees a sad tempest on the sea; or dances when God thunders from heaven; regards not, when God speaks to all the world.

Taylor.

Fresh gales and gentle *airs*
Whisper'd it to the woods; and from their wings
Flung rose, flung odours from the spicy shrub,
Disporting'

Paradise Lost.

Nor think, with wind
Of *airy* threats to awe, whom yet with deeds
Thou canst not.

Idem.

Nor (to avoid such meanness) soaring high,
With empty sound and *airy* notions fly.

Roscommon

I have found a complaint concerning the scarcity of money; which occasioned many *airy* propositions, for the remedy of it.

Temple's Miscell.

The painters draw their nymphs in thin and *airy* habits; but the weight of gold and of embroideries is reserved for queens and goddesses.

Dryden.

There are fishes that have wings, that are no strangers to the *airy* region.

Boyle.

If I were to tell what I mean by the word *air*; I may say, it is that fine matter which we breathe in and breathe out continually: or it is that thin fluid body, in which the birds fly, a little above the earth; or it is that invisible matter, which fills all places near the earth, or which immediately encompasses the globe of earth and water.

Watt's Logick.

As I was here *airing* myself on the tops of the mountains, I fell into a profound contemplation, on the vanity of human life; and passing from one thought to another, surely said I, man is but a shadow, and life a dream.

Spectator.

As meadows parch'd, brown groves, and with'ring flow'rs,

Imbibe the sparkling dew, and genial show'rs,
As chill dark *air* inhales the morning beam,
As thirsty harts enjoy the gelid stream;
Thus to man's grateful soul from heav'n descend,
The mercies of his Father, Lord, and Friend.

Sir W. Jones.

The eagle falls from her *aerial* tower,

And mingles with irrevocable dust;

But man from death springs joyful,

Springs up to life and to eternity.

Kirk White's Poems.

1. AIR, is a generic name for permanently elastic fluids; or, to speak with more strictness of language, for those exceedingly rare substances which are not condensable, even into what is commonly called the fluid state, by any degree of cold that has hitherto been found in nature, or produced by art. But as this term air, is, in its common signification, limited to the specification of that compound of aërial fluids by which the *atmosphere* is constituted, we shall in the present article restrict ourselves to the consideration of this last compound, and treat of other gaseous fluids under the words GAS and CHEMISTRY.

2. The atmosphere demands to be considered in three points of view; in the first instance we are naturally called upon to describe its physical and sensible properties; secondly, its chemical composition affords a rich source for minute investigation; and, lastly, it may be found interesting to discuss the medicinal relations of the air we breathe to the general conditions of health.

or sickness. It is in this order then that we now proceed.

3. SECT. I. PHYSICAL OR MECHANICAL PROPERTIES OF AIR.—The atmosphere is a thin, transparent, invisible, and elastic fluid, which surrounds our planet; and reaches to a considerable height above its surface, probably about forty miles.

4. Air is a *pōnduous* body. Of this property the ancients seem to have had some confused notions; thus Aristotle says that all the elements have gravity, and even air itself; and as a proof of it, he says, that a bladder inflated with air weighs more than the same when empty; and Plutarch and Stobœus quote him as teaching that the air in its weight is between that of fire and earth; and, further, he himself, treating of respiration, reports it as the opinion of Empedocles, that he ascribes the cause of it to the weight of air, which by its pressure forces itself into the lungs; and much in the same manner are the sentiments of Asclepiades expressed by Plutarch, who represents him as saying, among other things, that the external air by its weight forcibly opened its way into the breast. Nevertheless it is certain, however unreasonable it may seem, that Aristotle's followers departed in this instance from their master, by asserting the contrary for many ages together. Several of the phenomena arising from this property of ponderosity in the air, had, indeed, been remarked from the highest antiquity. Many centuries since, it was known that, by sucking the air from an open pipe, having its extremity immersed in water, this liquid arises above its level, and occupies the place of the air. In consequence of such observations, sucking pumps were contrived, and various other hydraulic machines; as Heron's siphons, described in his *Spiritalia*, or *Pneumatics*, and the water clocks known in Aristotle's time, under the name of *clepsydrae*, which alternately stop or run as the finger closes or opens their upper orifice. Indeed, the reason assigned by philosophers, many ages after, for this phenomenon, was a pretended horror which nature conceives for a vacuum; so, that rather than endure such vacuum, it makes a body ascend contrary to the powerful solicitations of its gravity. It is curious, we may remark by the way, to observe, how, in every part of ancient philosophy, final were thus mixed and confounded with efficient causes. Every thing in nature was explained on the principle of design.

5. Among the more modern investigators of the properties of air, we may first mention Galileo, who was born in the latter part of the sixteenth century. He found that a copper ball, in which the air had been condensed, weighed heavier than when the air was in its ordinary state of tension. The fact was afterwards demonstrated by Torricelli, whose attention was drawn to the subject by the attempt of a well-digger at Florence, to raise water, by a sucking pump, to a height exceeding thirty-three feet. It was then found that the *pressure* of the atmosphere, and not nature's abhorrence of a vacuum, was the cause of the ascent of the water in the pump-pipes; and that a column of about the height mentioned, was sufficient to equipoise the atmosphere.

6. In the year 1643, this able disciple of Galileo took a glass tube of *sorae* feet in length, sealed it hermetically at one end, and filled it with quicksilver; then inverting it, and holding it upright, by pressing his finger against the lower or open orifice, he immersed that end in a vessel of quicksilver; then removing his finger, and suffering the fluid to run out, the event verified his conjecture; the quicksilver descended till the column of it was about thirty inches high above the surface of that in the vessel below. Hence Torricelli concluded that it was no other than the weight of the air, incumbent on the surface of the external quicksilver, which counterbalanced the fluid contained in the tube. The empty space, formed by the descent of the quicksilver from the upper part of the tube, has been called the *Torricellian vacuum*, and is as perfect as any that can be formed.

7. Torricelli thus, not only proved that the air had ponderosity, but also that it is this property of the atmosphere which keeps water and quicksilver raised in pumps and tubes.

8. This experiment and its results soon became generally known. It was repeated and varied in several ways; Messrs. Pascal and Petit in France, especially occupied themselves in the investigation. At the age of twenty three, an experimental treatise was published by the former, entitled *Experiences Nouvelles touchant la Vuide*, in which the writer, after first reasoning on the old notion of nature's abhorrence of vacuum, adopts the Torricellian principle of pressure from the air, and devises several experiments in confirmation of it.

9. The very important discovery was now made, that upon ascending a mountain, quicksilver fell in the tube, because there was less air above to press upon the surface of the metal in the basin; and in this way the doctrine in question was not only illustrated and confirmed, but a method was discovered for ascertaining the height of mountains, by means of the barometer, this instrument, by the rise and fall of its contained fluid, indicating a corresponding change in the density of the atmosphere. See *BAROMETER* and *METEOROLOGY*.

10. At the surface of the earth, it has been seen that the mean density or pressure, is equal to the support of a column of quicksilver thirty inches high.

At 1000 feet above the surface the column	falls to	28·91 inches.

11. The weight of the air, and its mechanical properties in general are well illustrated by the *air-pump*; but for an account of this instrument and its uses, we must refer to another part of

our work See PNEUMATICS. It is sufficient for our present purpose to have established the principle that air has a positive weight, and that its density decreases in proportion to the altitude from the earth at which experiments are instituted.

12. The next quality of air which we may notice is its ELASTICITY, by which it is capable of being compressed into a smaller bulk than ordinary, but returns, like a spring to its original volume, immediately upon the pressing force being removed. It may be proper to remark, that this property of air is susceptible of some diminution, by long-continued and violent pressure. The property itself is easily rendered evident by the following simple experiment. Take a shrivelled bladder, which contains only a small quantity of air, and put it under the receiver of the air-pump; then exhaust the receiver of its air, and the bladder, from being shrivelled or collapsed, will expand itself to its full dimensions; thus proving the elasticity of the air contained within the bladder, which only awaited the taking off of the pressure from without, thus to expand its volume.

13. This property of air is distinct from its density, and indeed is, in a manner, opposed to it; and it will be found a law of elasticity, that it increases as the density of the air increases, for there must necessarily be a balance between action and re-action; i. e. the gravity of the air, which is a compressing power, and its elasticity, which is an expanding quality, will prove equal. Hence, its elasticity increasing or diminishing universally as the density increases or diminishes, it is of no consequence whether the air be compressed and retained in a given space by the weight of the atmosphere, or by any other means; it must endeavour, in either case, to re-act or expand with the same force. And hence, if air near the earth be pent up in a vessel, and all communication with the circumambient fluid be cut off, the pressure of the enclosed air will be equal to the weight of the atmosphere, at the time the quantity was confined.

14. By this property of expansion, air enters with facility into all parts not already occupied by the pressure of solid matter: thus it gains access into the pores of bodies, and creates a perpetual oscillation among the particles of the material universe. Indeed the degree of heat, and the air's gravity and density, and consequently its elasticity and expansion, never remaining the same for the least space of time, there must be an incessant vibration, dilation, and contraction in all bodies. From this cause it is, that the air contained in bubbles of ice, by its continued action bursts the ice. Thus, also, entire columns of marble sometimes are cleft in the winter, from the increased elasticity of some little bubble of air contained in them; and for the same reason it is that few stones will bear to be heated by fire without cracking into many pieces, by the increased expansive force of some air confined within their pores.

15. This principle of reciprocation is indeed traceable in its effects, even upon organic existence, although in this case, it is more under the modification of laws, which apply only to

living or organized matter; but the compression and expansion of vessels, in the vegetable kingdom, for example, must depend greatly upon the conditions of the atmosphere already alluded to; and it is found that no vegetation or germination is carried on in vacuo. The effects which follow the application of cupping glasses to the surface of the animal body are in proof, and illustration of this principle.

16. It has not, however, been fully ascertained to what degree, air of the density which it possesses at the surface of the earth, is susceptible of being compressed. Dr. Hales, by means of a press, condensed it thirty-eight; and afterwards, by forcing water in an iron globe, into 1551 times less space than it naturally occupies. But Dr. Halley, from experiments made both in London and at Florence, concluded that no force whatever is able to reduce air into 800 times less space than that which it naturally possesses on the surface of our earth. Experiments made by Mr. Boyle, however, in reference to the dilatability of the air, present astonishing results. This philosopher dilated it to even 13,679 times its natural space, and this without the help of fire. It is stated, indeed, that the air we constantly inspire, is compressed by its own weight into at least the 13679th part of the space it would occupy in vacuo. But if the same air be compressed or condensed by art, the space it would take up when most dilated, to that it occupies when condensed, will be, according to experiments, as 5500 to 1. PUMP, AIR.

17. This elastic property of the air is exerted equally in all directions; and when air is at liberty and freed from the cause which compressed it, it of course expands equally in all directions; and, in consequence, always assumes a spherical figure in the interstices of fluids in which it is lodged. This is evident when liquors are placed in the receiver of an air-pump, and the air exhausted; at first there appear a multitude of exceedingly small bubbles, like grains of fine sand, dispersed through the fluid mass, and rising upwards; and as more air is pumped out, they enlarge in size, but still they continue round. Also, if a plate of metal be immersed in the liquor, on pumping, its surface will soon be covered over with small round bubbles, composed of the air which adhered to it, now expanding itself: and for the same reason it is, that large glass globes, &c. are always blown up of a spherical shape, by blowing air through an iron tube into a piece of melted glass at the end of the pipe.

18. It will be understood, from what has been said, that the space occupied by a determinate quantity of air, is in the inverse ratio of the elastic force; and, from this law, it follows, that, with the same given temperature, the elasticity of two molecule of air does not augment by their mutual approach.

19. In order to render this inference sensible, let a mass of air be conceived to be enclosed in a bladder, which communicates with a recurved or syphon-like tube containing mercury, and let it be supposed that its elastic force is in equilibrium with a column of mercury; of thirty inches high: if the bladder be compressed in such manner that the air shall be reduced to half its

volume, the stratum of air contiguous to the surface of the liquid mercury, will evidently have a density twice as great as it had before the compression; and consequently, a double number of molecules of air will touch and act upon the surface; therefore, since, according to the experiment, the height of the column of mercury has been doubled, the elasticity of each molecule has necessarily been the same; thence it follows, as we have stated, that with a given temperature, the elasticity of the molecules of air is not increased by their mutual approach, the number is merely multiplied of molecules acting upon an assumed surface.

The truth thus established, manifestly conducts to the following results.

20. i. The molecules of gas yield sensibly only to the repulsive force of heat, and the attraction which they exercise one upon another, is very small, with respect to that force: thus, *their elasticity depends exclusively upon the temperature*, and the quantity of free caloric which exists in a mass of air, is, at equal temperature, proportional to its volume; for, if there were more under the same volumes in the state of condensation, than in dilatation, the repulsive force of two neighbouring molecule would be augmented.

21. ii. If the volume of a gas be diminished, a third or a half, there must be disengaged a third or a half of the free caloric which existed between its molecules. The effect of the caloric thus disengaged, is perceptible upon the velocity of sound; it produces the excess of that velocity, over that given by the ordinary theory; as has been shewn by the calculus of Laplace and others.

22. iii. If we conceive equal volumes of two different gases comprised in two envelopes of the same capacity, and inextensible; and suppose that at a given temperature, the elasticity of these two gases is the same; on augmenting in the same manner their temperature, the augmentation of their elasticity will be the same, since it depends only upon their temperature. If we now conceive the envelope comprising the two gases to become extensible, the gases will dilate, until their elasticity is in equilibrio with the pressure of the atmosphere surrounding the envelope; and since for each gas the volume is in the inverse ratio of the elastic force, the two gases will assume the same volume, and will dilate equally; which is conformable to experience.

23. FLUIDITY is another property which philosophers have ascribed to air; but this quality should be, perhaps, in strict propriety, regarded negatively, or considered as an insusceptibility of being made to assume the condition of a solid, by any extent of condensing power, or pressure, which art is capable of effecting, or perhaps, man of conceiving. True it is, as we shall immediately see, when treating on the chemical properties of the atmosphere, that the specific principles which enter into the formation of air, are capable of passing from an aerial, or fluid, into a solid state; and there is even some complication connecting itself with this result, when minute investigation is given to its rationale; but that air, as air, should be solidifiable, im-

plies, under our present acquaintance with the laws of the universe, a contradiction in terms.

24. SECT. II. We now then proceed to the second division of our subject, viz. THE CHEMICAL COMPOSITION, AND PROPERTIES OF ATMOSPHERIC AIR—a subject which cannot be contemplated in all its bearings, without exciting astonishment and admiration—a subject, indeed, which involves all the leading, and many of the minor circumstances, by which the line of demarcation is marked out between the chemistry of former times, and the chemistry of the present day, with more decision, fulness, and force, than, perhaps, is done in any other department of scientific inquiry.

25. In following the march of philosophy, commencing from the earliest periods, the reflecting observer will often meet with announcements and intimations, which imply, on the part of the persons making them, and the periods in which they were made, a greater precision and accuracy, in respect of particular insights into nature's laws, than either the persons or the times in other ways substantiate: this remark will be found to apply with especial propriety to the topic now under discussion; so much so indeed, that some have refused the credit of novelty and discovery, to the development of those laws of atmospheric composition, and the circumstances of gaseous being, which have recently operated that vast reformation in chemical research, to which we have above adverted. But it should be recollect, in justice to the moderns, that the lights alluded to were spent and dispersed amidst the surrounding darkness of the æra in which they appeared—that the individuals by whom these anticipations of future discoveries were made, seemed scarcely themselves conscious of the great fundamental truths they were indicating; and even at farthest, as was remarked by a modern chemist of most deserved celebrity: ‘We are not to consider conclusions as unavailing, because anticipated; the very circumstance of attaining them by different means justifies the research; and he, whose investigations disclose new views, and unfold new truths, may rest satisfied that he has not laboured in vain, because he ultimately arrives where others have been before him. In estimating, however, the true merits of chemical discoveries and inventions; and more especially in determining the excellence and originality of theories, it is requisite to look to their sources, to examine the steps which led to them, and the paths by which they are surrounded; and upon that examination to found our opinion.’

26. The leading feature and important novelty of the science, as influencing its progress in the last century, was certainly *the discovery of gaseous bodies*, and the perfection of pneumatic chemistry, without which, analysis could have made little progress; and independent of which, all improvement in theory would have been but lame and ineffectual: it was also materially, though less directly assisted by those investigations respecting the agency of heat, in which Dr. Black made himself so eminently conspicuous.

27. We deem it expedient then, in this place,

instead of limiting ourselves to a statement of the chemical components of the air we breathe, first to give a succinct history of the several circumstances by which the great laws at present known to regulate aerial bodies, became gradually developed into their present state of maturity.

28. It is now about two hundred years, since the burning of some substances in the open air, was distinctly observed to be attended with an increase of weight. Le Brun having melted two pounds six ounces of tin, found that in six hours the whole had passed into a state of calx, weighing three pounds one ounce : and, being puzzled at the circumstance, he consulted Rey, a physician of Perigord, as to its cause, who immediately set about an investigation of the matter, which terminated in explicitly referring *the cause of the increase to the fixation of air.*

29. We request the reader particularly to notice the above, as being the first among modern intimations, of the relation in which certain kinds of solid substances stand, to the invisible matter oy which they are surrounded.

30. Hooke in his investigations, and Boyle by his experiments with the air-pump, which was now just perfected and coming into use, succeeded not merely in demonstrating the important part performed by the pressure of atmospheric air in combustion, but Hooke carried his enquiries still further, and, in his mind's eye at least, seems to have seen, and anticipated, the results that were gained at a much later period of chemical science, and established upon a less questionable authority.

31. These, more than intimations, we may almost say, of Hooke, were further illustrated by John Mayow, who was born in Cornwall, in the year 1645, and died in London, 1697, at the house of an apothecary, in York-street, Covent Garden. This experimentalist seems to have been early struck with the analogy between the phenomena of combustion and those of respiration. He burned a candle-end in a bell-glass, and found the air so deteriorated, as to be unfit for the continuance of combustion. He then confined a mouse in a similar portion of air, and it soon manifested the want of its renewal. Then, by putting a mouse and a candle under the same bell-glass, he found it live only half the time that it had survived when under the glass alone. He then renewed the experiment, and endeavoured to fire combustible matter in air that had been spoiled by breathing; and finding that it would not burn, he observes, that '*the nitro-aérial particles are absorbed both by the candle and the animal.*'

32. Examining the residuary air standing over water after combustion, he found that it was a little lighter than the atmosphere, and extinguished flame; then he described the deleterious as well as the vivifying portion of the atmosphere, and speaks of the former as a non-supporter of combustion, of its being not absorbable by water, and, as we have intimated, of its being lighter than atmospheric air itself. The next individual whom it is in order to name, in this historical sketch, is Dr. Hales, who was born in Kent, in the year 1677, and died at Teddington, 1761. This highly talented and virtuous man commenced

the communication of his researches to the Royal Society about the year 1717: and in 1727 he published his 'Statistical Essays,' containing a specimen of an attempt to analyse the air by a great variety of chemico-statistical experiments, which were read at several meetings before the Royal Society.'

33. Dr H. employed several methods of collecting and examining the gaseous products of a variety of bodies, many of which, approach those that now are in use. Sometimes he placed substances upon a stand, under a bell-glass, inverted over water; or he employed a flask to contain the materials, producing aërial matter, over which was placed a bell-glass, the whole being confined over water as before; or, where a high temperature was required for the production of the gaseous bodies, he used an iron retort, formed of a bent gun-barrel, and received the air into a vessel inverted in a tub of water.

34. In the course of his investigations, Dr. H. observed that phosphorus, when burned, *absorbed air*, and produced white fumes; but he neglected any examination of the product and of the residue. He distilled air from wood, and found it fatal to animals; from Newcastle coal he obtained one third its weight of gas; from nitre, one hundred and eighty times its bulk; and from salt of tartar urged by intense heat, he also procured aërial matter; but in no one instance did he examine these gaseous bodies with the attention that might have been expected from an experimentalist so diligent and original. He found that iron filings, and oil of vitriol produced scarcely any air; but that upon the addition of water, gas was abundantly evolved from such a mixture. Here he obtained hydrogen, but instead of stopping to examine its properties, he hastens on to irrelevant observations, and seems always eager rather to multiply experiments, than to examine their results.

35. In the experiments on respiration, Dr. Hales obtained results of such interest, that one is surprised (says the intelligent historian whom we are now principally following) at the coldness with which he pursued them, and the carelessness with which he drops the enquiry. Finding that a given quantity of air could only be respired for a given time; and that it soon produced oppression and difficulty of breathing, in consequence, as he says, 'of the gross and sulphureous vapours with which it becomes loaden'd,' he endeavoured to discover some substance, which by absorbing those vapours, might render respired air more fit for breathing and consequently contribute to its purification in small and crowded rooms, and other similar situations. In other experiments the author notices the purification of air spoiled by the burning of candles, and of brimstone, by the action of calcined tartar; but he takes no pains to enquire into the specific actions of the salt, and confounds it with that of saline bodies generally.

36. These charges of oversight and neglect, when seemingly a little closer attention might have effected so much in the way of discovery, scarcely seem applicable to this great man's researches respecting the connection of the vegetable world with the circumambient air; and

besides other important particulars, which are not applicable to our present purpose, he engaged in a series of experiments, to shew that a considerable quantity of air is inspired by plants; but still he always fails of precisely discriminating between common air and the various gaseous products that resulted from some of his experiments; and therefore, as was likewise the case with his contemporary Boerhaave, stopped short of giving any thing like a satisfactory account of the component parts of atmospheric air.

37. Indeed the fixability of air, if we may so express it, remained for proof, until the two great discoveries of Dr. Black came to be applied to the investigation of gaseous being; and it has always appeared to us, that these discoveries effected more towards producing a thorough reformation in the whole body of chemical doctrines, than any thing prior or posterior to them. What were these discoveries? When Dr. Black first entered the precincts of chemistry, (we, in this and several other places, use the words of Brande,) there was a busy and acute controversy respecting the cause of causticity, in earths and alkalies; it was, by some, supposed that the conversion of lime-stone into quicklime depended upon its absorbing certain igneous particles; by others, the change was referred to an acrid acid, contracted in the fire; by others, to non-descript saline particles.

38. Dr. Black's notice appears to have been drawn to this enquiry, by the researches of Hoffman concerning the nature of magnesia: he found that when that earth was obtained, by adding a mild alkali to a solution of Epsom salts, it effervesced upon the addition of an acid; but that, if heated red hot, it no longer effervesced, and, moreover, lost considerably in weight. The same fact applied equally to lime, and led him to believe, that that substance, instead of acquiring its acrimony by the absorption of something from the fire, became caustic, by the loss or expulsion of one of its elements, in consequence of being heated. He then distilled some magnesia in a retort; but finding that though it diminished considerably in weight, the only visible loss it sustained was a minute portion of water, he *conceived the possibility of the escape of some gaseous matter*; and, on mixing common magnesia and an acid in a proper phial, he collected a considerable quantity of a permanently elastic gaseous body; from chalk, or lime-stone, and from the mild alkalies he procured a similar gas, and termed it *fixed air*—a term which, however improper, may be taken partly in proof of the fact, that our present discoverer was the first properly to appreciate the concentrability of gaseous principles. Dr. Black was born in France, of Scotch parents, in 1728. He died at Edinburgh in 1799.

39. The next of the two great discoveries of this extraordinary man, respects the different circumstances in which bodies exist in relation to heat. This power, heat, had only been thought of as a cause of raising the temperature, or changing the form of bodies; but Dr. B.'s remarks established this very important and commanding principle, viz. that, independently of temperature and even of form, heat attaches itself

to material substances in such sort as to be lost to the *senses*, or become hidden. It had already, indeed, been observed, that ice, during liquefaction, retained an uniform temperature of 32° , and that water, during its boiling, never became hotter than 212° , hence the use of those fixed points in the graduation of thermometers. See *THERMOMETER*. We have now to indicate merely the views which these phenomena suggested to Dr. Black, and the results that followed his enquiries into their cause and effect. It will be more in order to engage in the detail of these important investigations, in another place, See *CHEMISTRY* and *CALORIC*; but it will be necessary here just to say sufficient for the detection of the principle.

40. When water, it has already been said, is made to boil, the steam which rises is not hotter than the water itself, although there be a continual influx of heat, *which, therefore, must become latent in the steam*; and consequently steam and other vapours may be regarded as compounds of liquids and heat. Again, let two masses of matter be mixed together, and the temperature of the mass will not prove a mean of the temperature of the two, but will be higher or lower, according to the nature of the materials employed, without a proportionate quantity of heat being presented to the senses, or even demonstrating itself by causing thermometrical variation: hence the heat which thus by admixture has been made to disappear, was said to become latent; and the principle which effects this, is one which presents a clue to the whole secret of vaporous, aerial, and gaseous existence; and gives a facility to our experiments and reasoning on the subject of gaseous constitution, to an almost incalculable extent.

41. We have now to advert to the labours of another philosopher, whose investigations on the subject of air, have proved especially available in reference to the topic under notice, viz. the chemical habits and circumstances and composition of the air we breathe. What was by him called dephlogisticated air, and what is now usually termed oxygen gas, was discovered by Dr. Priestley, on the first of August 1774. The method of experimenting, which he adopted, consisted in exposing a quantity of red precipitate of mercury to the action of the sun's rays, concentrated by a burning lens; the red precipitate was contained in a small flask, filled up with quicksilver, and inverted in a basin of the same metal: 'I presently found (he says) that by means of this lens, air was expelled from it very readily. Having got about three or four times as much as the bulk of my material, I admitted water to it, and found that it was not imbibed by it. But what surprised me more than I can well express, was, that a candle burned in this air with a remarkably vigorous flame, very much like that enlarged flame with which a candle burns in nitrous air, exposed to iron, or liver of sulphur; but, as I got nothing like this remarkable appearance from any kind of air, besides this particular modification of nitrous air, and I knew no nitrous acid was used in the preparation of the *mercurius calcinatus*, I was utterly at a loss how to account for it.'

42. Nitre and other substances were afterwards shown by Dr. Priestley to afford this kind of air, and in the event it came to be ascertained, that the matter thus detected by our experimentalist, as a constituent, so to say, of those bodies, is in truth the main vivifying ingredient of the aerial mass in which we are enveloped.

43. The constitution indeed of the atmosphere, was one among the many enquiries that engaged Dr. Priestley's diligence, and that was made out during the period of his activity. In 1772, Dr. Rutherford demonstrated the existence of a peculiar elastic fluid in atmospheric air, differing from fixed or mephitic air; and yet, like it, extinguishing flame, and unfit for respiration. This component part of the atmosphere, was denominated by Dr. Priestley phlogisticated air, as the other had been dephlogisticated.

44. While Priestley was thus occupied in Britain, Scheele, on the Continent, was almost simultaneously engaged in investigations that led to nearly similar results. Finding air necessary for the production of fire, this last experimentalist turned his attention to its analysis. He found that a solution of liver of sulphur, and certain other sulphurous compounds, occasioned a diminution in the bulk of air to which they were exposed, equal to one part in about five. He likewise obtained what he calls empyreal air, the dephlogisticated air of Priestley, and the oxygen gas of the new nomenclature, by the decomposition of the nitrous acid, and other processes; he also shews by direct experiments, that the absorption occasioned in atmospheric air by liver of sulphur, is referrible to the abstraction of its empyreal portion; that it totally absorbs empyreal air; and that upon adding to the residuary portion of atmospheric air, a quantity of empyreal air, equal to that absorbed by the sulphureous liquor, an air is again compounded, similar in all respects to that of the atmosphere.

45. But now the terms dephlogisticated, empyreal, &c. were to be exploded, and a new nomenclature introduced into the science of pneumatic chemistry, founded on the principle, that the old theories assumed the presence of an undemonstrable material. It has already been said, that one of the first steps leading to the detection of aerial circumstance was, the observation that the burning of some materials in the open air, occasioned an increase of weight in the materials so treated; this increase of weight in the calcined body, was subsequently found to correspond, *ceteris paribus*, with the quantity of air that disappeared during the experiment; and it is upon this fact that the Lavoisierian or oxygenous theory came to oppose itself to the phlogistic principles and nomenclature of Priestley and others. Lavoisier analysed atmospheric air in the following way: he exposed fifty cubic inches of it to heated mercury, by which it underwent a decrease equal to one sixth of its original bulk, and became unfit for respiration and combustion; at the same time the quicksilver was partly converted into a reddish matter, forty-five grains of which, heated red hot in a proper retort, afforded 41.5 of run-

ning mercury, and seven or eight cubical inches of gas, eminently supporting combustion, and being the dephlogisticated air discovered by Priestley. The recombination of the forty-two cubical inches of the mephitic air of the retort, with the eight cubical inches of dephlogisticated air, separated from the mercury, reproduced fifty cubic inches of atmospheric air.

46. Here then, say the opponents of the phlogistic hypothesis, we have both analysis and synthesis, both composition and reduction, to prove that the principle of phlogiston is a gratuitous and unnecessary assumption, complicating what is simple, and implying a contradiction in terms. All aeriform fluids, says Lavoisier, are compounds of a ponderable basis, with heat and light; in the above experiment, the ponderable part of what, in the school of Priestley, was named dephlogisticated air unites to the quicksilver; this union is effected under other circumstances in different ways and various degrees, and according to the manner of junction, or the quantity combined with the base, different compounds are formed; in all instances, however, it is assumed that the process of combination is effected by taking this same something from the air, and fixing it in the material employed in the experiment. This something was denominated oxygen gas by the new theorists, from its general tendency to form acids; and a system of highly ingenious and plausible, but in some instances, as has been subsequently proved, of untenable generalization, was now made to apply in the way of exposition to all the phenomena of pneumatic chemistry. See COMBUSTION.

47. Thus we see, by taking a slight retrospective glance upon the ground that has been gone over, that Le Brun's experiment on combustion, together with Mayow's observation of the concentration of nitro-aerial particles, that Hale's subsequent experiments proving the absorption of air during combustion and respiration—that Black's discovery of the actual fixidity of air, and the latency of heat; and lastly, that Priestley's detection of the presence of dephlogisticated air, or according to the more modern nomenclature, oxygen gas, in the presence of certain metallic substances, have constituted altogether the materials out of which our present knowledge of the laws and constitution of the atmosphere has come to be established; and we now proceed to state more precisely, the component parts of which it is formed, the general habits of the ingredients which enter into its composition, and the means to which nature resorts in order to perpetuate its uniformity and purity.

48. Atmospheric air is composed of at least two species of air, or elastic fluid—the one called oxygen gas or vital air, the other azotic, or more recently nitrogen gas. The first of these is the great agent in respiration and combustion; and upon the proper proportion of it depends the purity of the atmosphere. The latter possesses contrary qualities, is noxious to animals, and incapable of maintaining combustion; the proportion of these two parts of atmospheric air, is commonly about twenty-six or twenty-seven parts of oxygen air, and seventy-four or

seventy-three parts of azotic gas by weight; or about twenty-two parts of the former, and seventy-eight of the latter by bulk. A small portion of hydrogen and carbonic acid gases are found indeed to enter its composition; but these two last ingredients are naturally in such small quantity as scarcely to deserve notice.

49. The immense mass of permanently elastic fluid, (says Ure,) which surrounds the globe we inhabit, must consist of a general assemblage of every kind of air which can be formed by the various bodies which compose its surface. Most of these, however, are absorbed by waters; a number of them are decomposed by combination with each other, and some of them are seldom disengaged in considerable quantities by the processes of nature. Hence it is that the lower atmosphere consists chiefly of oxygen and nitrogen, together with moisture, and the occasional vapours or exhalations of bodies. The upper atmosphere seems to be composed of a large proportion of hydrogen, a fluid of so much less specific gravity than any other, that it must naturally ascend to the highest places, where, being occasionally set on fire by electricity, it appears to be the cause of the aurora borealis and fire-balls. It may easily be understood that this will only happen on the confines of the respective masses of common atmospherical air, and of the hydrogen, or inflammable air, that the combustion will extend progressively, though rapidly, in flashings from the place where it commences; that when by any means a stream of inflammable air, in its progress towards the upper atmosphere, is set on fire at one end, its ignition may be much more rapid than what happens higher up, where oxygen is wanting, and at the same time more definite in its figure and progression, so as to form the appearance of a fire-ball. See METEOROLOGY.

50. In the historical sketch we have above given, of the successive steps by which we have acquired the knowledge of aerial compound, will have been seen the Lavoisierian mode of analyzing the air; but it may be right to be still more particular on this head, and give the following experimental method of ascertaining the component principles of the atmosphere. If heat, then, be applied to mercury enclosed in a proper vessel of atmospheric air, the air will be diminished, and the mercury will lose its splendour, gradually changing to a reddish powder, and acquiring an addition to its weight. When no further change is observed, the separation of the principles of air has taken place. That portion which remains in the receiver is unfit for supporting flame, or maintaining respiration, and is azotic or nitrogen gas; the other part which is oxygen gas, is absorbed by the mercury, which it reduces to the state of an oxide, and from which it may afterwards be extracted by heat. By this last operation the mercury will be restored to its metallic state, and will lose the weight it had acquired during its oxidation. These separated gases thus differing in their properties from each other, and from atmospheric air, being again mixed in the proportions above stated, form atmospheric air of the ordinary degree of purity; differing from it, however, in some trifling respects, yet not so much as to invalidate the gene-

ral conclusion, but which differences are probably occasioned by our inability to combine the ingredients so perfectly as they are combined by nature.

51. Oxygen, then, and azote, being the main and primary, while carbonic acid, and hydrogen gases are the less and more incidental components of the atmosphere, we now go on to treat separately of these several ingredients in the order above enumerated.

52. i. Of OXYGEN GAS.—This gas forms about a fifth part of the atmosphere. Water contains 88.88 per cent. of it; and it exists in most vegetable and animal products, acids, salts, and oxides.

53. This gas may be obtained from nitrate of potash, exposed to a red heat in a coated glass, or earthen retort, or in a gun barrel, from a pound of which about 1200 cubic inches may be obtained; but this is liable, particularly towards the end of the process, to a mixture of nitrogen. It may be expelled from the red oxide of mercury or that of lead, and still better from the black oxide of manganese heated red hot in a gun-barrel, or exposed to a gentle heat in a retort with half its weight, or somewhat more of strong sulphuric acid. To obtain it of the greatest purity, however, the chlorate of potash is preferable to any other substance, rejecting the portions that first come over, as being debased by the atmospheric air in the retort. Growing vegetables exposed to the solar light, give out oxygen gas; so do leaves laid on water in similar situations, the green matter that forms in water, and some other substances.

54. Oxygen gas has neither smell nor taste. —Its specific gravity is 1.1111, 100 cubic inches weigh 33.88 gr. It is a little heavier than atmospheric air. Under great pressure water may be made to take up about half its bulk. It is essential to the support of life—hence called vital air; an animal will live in it a considerable time longer than in atmospheric air; but its respiration becomes hurried and laborious before the whole is consumed, and it dies, though a fresh animal of the same kind, can still sustain life for a certain time in the residuary air.

55. Combustion is powerfully supported by oxygen gas. Any inflammable substance previously kindled and introduced into it, burns rapidly and vividly. If an iron or a copper wire be introduced into a bottle of oxygen gas, with a bit of lighted touch-wood or charcoal at the end, it will burn with a bright light, and throw out a number of sparks. The bottom of the bottle should be covered with sand, that these sparks may not crack it. If the wire coiled up in a spiral form like a cork-screw, as it usually is in this experiment, be removed with a jerk, the instant a melted globule is about to fall, so as to throw it against the sides of the glass, it will melt its way through in an instant; or if the jerk be less violent lodge itself in the substance of the glass. If it be performed in a bell-glass, set in a plate filled with water, the globules will frequently fuse the vitrious glazing of the plate, and unite with it so as not to be separable without detaching the glaze, though it has passed through perhaps two inches of water.

56. ii. Of AZOTIC OR NITROGEN GAS.

This gas constitutes four-fifths of the volume of the atmosphere. The readiest mode of procuring it is, to abstract its oxygenous associate, by the combustion of phosphorus, or hydrogen. It may be also obtained from animal matters, subjected in a glass retort to the action of nitric acid diluted with eight or ten times its weight of water.

57. Azote possesses all the physical properties of air. It extinguishes flame and animal life. It is absorbable by about 100 volumes of water. Its specific gravity is 0.9722. 100 cubic inches weigh 29.65 grains. It has neither taste nor smell. It unites with oxygen in four proportions, beside that of atmospheric air, forming four important compounds. These are, 1st. The nitrous oxide, or protoxide of azote. 2d. Nitrous gas, nitric oxide, or deutoxide of azote. 3d. Nitrous acid. 4th. Nitric acid. It also combines with chlorine and iodine, constituting by the union, two very formidable compounds. For an account of the habits of these several compounds, the reader must consult the general article CHEMISTRY, and turn to the respective substances: some under the head of Gas, and others in their respective alphabetical order.

58. Azote has hitherto resisted all attempts to decompose it; but it is supposed to be of a compound nature, from its being found abundantly in the organs of animals, which feed on substances that do not contain it.

59. Its uses in the economy of the globe are little understood. This is likewise favourable to the idea that its real chemical nature is as yet unknown, and leads to the hope of its being decomposable.

60. It would appear that the atmospheric azote and oxygen spontaneously combine in other proportions, under certain circumstances, in natural operations. Thus we find that mild calcareous, or alkaline matter favours the formation of nitric acid in certain regions of the earth; and that they are essential to its production in our artificial arrangements for forming nitre from decomposing animal and vegetable substances.

61. iii. Of CARBONIC ACID GAS.—This gas cannot be formed by the chemist from the direct combination of its constituents; for, at the temperature requisite for effecting a union, the carbon attracts its full dose of oxygen, and thus generates carbonic acid. To obtain it pure, our only plan is to abstract one proportion of oxygen from carbonic acid, either in its gaseous state, or as condensed in the carbonates. Thus by introducing well-calcedined charcoal into a tube, traversing a furnace, and, when heated to redness, passing over it backwards and forwards, by means of two attached mercurial gasometers, or bladders, a slow current of carbonic acid, we convert the acid into an oxide more bulky than itself. Each prime of the carbon becomes now associated with only one of oxygen, instead of two as before. The carbon acting here by its superior mass is enabled to effect the saturation of the oxygen.

62. The specific gravity of this gas is stated by Lussac and Thenard, from theoretical considerations, to be .96782, though Mr. Cruikshanks's experimental estimate was little more than .9500.

63. ‘Carbonic gas is emitted in large quantities by bodies in the state of the vinous fermentation; and on account of its great weight it occupies the apparently empty space, or upper part of the vessels in which the fermenting process is going on. A variety of experiments may be made in this elastic fluid. Lighted paper, or a candle dipped into it, is immediately extinguished, and the smoke remaining in the carbonic acid gas renders its surface visible, which by agitation may be thrown into waves like water. If a dish of water be immersed in this gas, and briskly agitated, it soon becomes impregnated, and obtains the pungent taste of Pyrmont water. In consequence of its weight, this gas may be lifted out in a pitcher or bottle, which, if well corked, may be used to convey it to great distances, or it may be drawn out of a vessel by a cock like a liquid. The effects produced by pouring it from one vessel to another have a singular appearance. If a candle or small animal be placed in a deep vessel, the former becomes extinct, and the latter expires, in a few seconds after the gas is poured upon them, though the eye is incapable of distinguishing any thing that is poured. If, however, it be poured into a vessel full of air, in the sun-shine, its density, being so much greater than that of the air, renders it slightly visible by the undulations and streaks it forms in this fluid as it descends through it.’—URE. For a further account of this gas see CARBONIC ACID, and CHEMISTRY.

64. iv. OF HYDROGEN GAS.—This is the lightest species of ponderable matter hitherto discovered. It can be procured from water, of which it forms an essential ingredient. It was discovered by Mr. Cavendish in 1766.

65. Hydrogen gas is about 14.4 times less dense than common air; sixteen times less dense than oxygen; and fourteen times less dense than azote. It is colourless and possessed of all the physical properties of air. It has usually a slight garlic odour, arising probably from arsenical particles, derived from the zinc used in its preparation. When water is transmitted over pure iron in a state of ignition, it yields hydrogen free from smell. It is eminently combustible, and if pure, burns with a yellowish white flame; but from accidental combination, its flame has frequently a reddish tinge. Animal life, and flame are extinguished by this gas, though Sir H. Davy has shewn, that if the lungs be not previously exhausted by a forced exhalation, it may be breathed for a few seconds without much seeming inconvenience.

66. When five measures of atmospheric air are mixed with two of hydrogen, and a lighted taper, or an electric spark is applied to the mixture, explosion takes place, three measures of gas disappear, and moisture is deposited on the inside of the glass.—When two measures of hydrogen, mixed with one of oxygen, are detonated, the whole is condensed into water. These experiments give us, on a small scale, instances of thunder, lightning, and rain.

67. Hydrogen, combined with oxygen forms water, with chlorine, muriatic acid; with iodine, hydriodic acid; with prussine, prussic acid; with carbon, subcarbonates, carbonates, and hydrates; with azote, ammonia; with phosphorus, phos-

phates, &c.; with sulphur, sulphates, &c.; with arsenic, arsenuretted hydrogen; with tellurium, telluretted hydrogen; with potassium, potassuretted hydrogen; for an account of which, see CHEMISTRY, and the articles in their alphabetical order.

68. A Question of much interest has been agitated among chemical philosophers, viz. whether the different ingredients which enter into the composition of air, be commingled in a merely mechanical manner, or whether there be an actually chemical junction of the materials by which the atmosphere is constituted.

69. Now, as oxygen and azote, or nitrogen, differ in specific gravity, in the proportion of 135 to 121, according to Kirwan, and 139 to 120 according to Davy, it has been presumed, that the oxygen would be more abundant in the lower regions, and the azote in the higher, if they constituted a mere mechanical mixture, which appears contrary to fact, because they both retain their distinctive properties unaltered, and no change of temperature or density takes place on their union. But perhaps it may be said, as they have no repugnance to mix with each other, as oil and water have, the continual agitation to which the atmosphere is exposed, may be sufficient to prevent two fluids, differing not more than oxygen and nitrogen in gravity, from separating by subsidence, though simply mixed. On the contrary, it may be argued, that to say chemical combination cannot take place without producing new properties which did not exist before in the component parts, is merely begging the question; for though this generally appears to be the case, and often in a very striking manner, yet combination does not always produce a change of properties, as appears in M. Biot's experiments, with various substances, of which water may be instanced, the refraction of this being precisely the mean of that of the oxygen and hydrogen, which are indisputably combined in it.

70. Mr. Dalton considers the general atmosphere as composed of four fluids principally, or four particular atmospheres, namely, those of the four gases above-mentioned. These, he supposes, to be totally unconnected with each other; the particles of the one, not acting on the particles of the other; agreeably to his opinion that in a mixture of two or more different elastic fluids, the particles of the one neither attract nor repel those of the other, differing in this, from the particles of homogeneous elastic fluids, which repel each other, with a force reciprocally proportional to the distance of their centres from each other. Applying this principle to atmospheric air, he supposes that the density and elastic force of each gas at the earth's surface, are the effects of the weight of the atmosphere of that gas solely; different atmospheres not gravitating one upon another, any more than if each were in a vacuum.

71. This hypothesis, says Dr. Ure, might account for the state of the atmosphere, it is true; but it does not agree with certain facts. In the case of the carbonic acid gas in the Grotto del Cani, and over the surface of brewers' vats, why does not this gas expand itself freely upward, if the superincumbent gases do not press upon it?

Mr. Dalton himself too, instances as an argument for this hypothesis, that oxygen and hydrogen gases when mixed by agitation, do not separate on standing. But why should either oxygen or hydrogen, require agitation to diffuse it through a vacuum in which, according to Mr. Dalton, it is placed?

72. The theory of Berthollet (continues Dr. U.) appears consistent with all the facts, and sufficient to account for the phenomena. If two bodies be capable of chemical combination, their particles must have a mutual attraction for each other. This attraction, however, may be so opposed by concomitant circumstances, that it may be diminished in any degree. Thus we know that the affinity of aggregation, may occasion a body to combine slowly with a substance for which it has a powerful affinity; or, even entirely prevent its combining with it; the presence of a third substance may equally prevent the combination; and so may the absence of a certain quantity of caloric. But in all these cases the attraction of the particles must subsist, though diminished or counteracted by opposing circumstances. Now we know that oxygen and nitrogen are capable of combination, their particles therefore must attract each other; but in the circumstances in which they are placed in our atmosphere, that attraction is prevented from exerting itself to such a degree, as to form them into a chemical compound, though it operates with sufficient force to prevent their separating by their difference of specific gravity. Thus the state of the atmosphere is accounted for, and every difficulty obviated without any new hypothesis.

73. It is a curious fact, that the proportions of the atmosphere are preserved under a vast variety of circumstance and place; and the proportion of oxygen to its antagonist ingredient, appears to be very nearly the same, whether it be in this country, or on the coast of Guinea; on low plains, or lofty mountains, or even at the height of 7250 yards above the level of the sea; as ascertained by Gay Lussac, in his aerial voyage in September, 1805. This being the case, it becomes interesting to ascertain, or to endeavour at ascertaining, what are the provisions of nature by which this proportion of oxygen in the atmosphere, that is continually consumed in respiration and combustion, is again restored to the atmosphere. As far as an estimate can be formed of the great and general operations of nature, there appears to be at least as great an emission as there is consumption of oxygen. Thus in volcanic eruptions there appears to be at least as much oxygen emitted, or extricated by fire from various minerals, as is sufficient to maintain the combustion, and perhaps to ameliorate the atmosphere; and in the bodies of plants and animals, which appear in a great measure to derive their sustenance and augmentation from the atmosphere and its contents, it is found that a large proportion of nitrogen exists. Most plants, as shewn by the experiments of Dr. Priestley and others, emit oxygen in the sunshine, from which it is highly probable, that they imbibe and decompose the air, retaining carbon, and emitting the vital part. Lastly, if to this we add the decomposition of water, and

the effects consequent upon the agitation of large seas and rivers, there will be numerous occasions in which the aqueous fluid will supply us with disengaged oxygen ; while, by a very natural supposition, the hydrogen of this fluid may be considered as having entered the bodies of plants, for the formation of oils, sugars, mucilages, &c. from which it may again be extricated. On this head, however, we have still much to learn.

74. On this interesting topic, which as we have just said, demands further investigation, we may here, with propriety introduce an extract from an author, whose labours we have already made use of in the present article. Among the many and ingenious investigations of Dr. Priestley, says Mr. Brande, none have produced more pleasing subjects of inquiry, than those relating to the influence of vegetation upon air, contaminated by combustion, respiration, and the putrefaction of animal matter.

75. Finding that air was not spoiled by the growth of a sprig of mint kept in it for some months, our author thought it possible that the process of vegetation might restore the air injured by burning candles ; and, accordingly, on the 17th of August, 1777, he put a sprig of mint into air, in which a wax candle had burned out ; and on the 27th of the same month, found that another candle burned perfectly well in it ; and then, to verify the conclusion, he divided the injured air into two separate portions, putting the plant into one of them, and merely leaving the other standing over water ; he never failed to find, that a candle would burn in the former, but not in the latter.

76. This restoration of air, says Dr. Priestley, I found, depended upon the vegetating state of the plant ; for though I kept a great number of the fresh leaves of mint, in a small quantity of air, in which candles had burned out, and changed them frequently for a long space of time, I could perceive no melioration in the state of the air. This remarkable effect does not depend upon any thing peculiar to mint ; for I found a quantity of this kind of air, to be perfectly restored by sprigs of balm.' Grounsel, spinach, and some other plants were used, with like effect, to show that it did not depend upon aromatic effluvia.

77. In Dr. Priestley's observations on air, infected with animal respiration and putrefaction, a multitude of facts are adduced to demonstrate its renovation, when exposed to growing vegetables, and he is thus led to the following general remarks on the subject. ' These proofs of a partial restoration of air, by plants in a state of vegetation, though in a confined and unnatural situation, cannot but render it highly probable, that the injury which is continually done to the atmosphere by the respiration of such a number of animals, and the putrefaction of such masses of both vegetable and animal matter is, in part, at least, repaired by the vegetable creation, and notwithstanding the prodigious mass of air that is corrupted daily by the above mentioned causes ; yet, if we consider the immense profusion of vegetables upon the face of the earth, growing in places suited to their nature, and, consequently at full liberty to exert all their powers, both in-

haling and exhaling, it can hardly be thought but that it may be a sufficient counterbalance to it, and that the remedy is adequate to the evil.

78. When treating on the economy of vegetation, we shall have again to advert to this subject, and to mention the experiments of Ingenhouz and others in reference to these particulars.

79. The air of the atmosphere, like other fluids, appears to be capable of holding bodies in solution ; and ' the dissolving faculty of the air,' is treated of by authors among its chemical properties. It indeed takes up water in considerable quantities, with a consequent diminution of its own specific gravity ; from which circumstance, as well as from the consideration that water rises very plentifully in the vaporous state *in vacuo*, it seems probable that the air suspends vapour, not so much by a real solution, as by keeping its particles asunder, and preventing their condensation. Under the word METEOROLOGY, we shall have more fully to engage in considerations relative to the circumstances of air, in connection with aqueous fluid.

80. We now proceed to the last division of our subject and treat of the PROPERTIES OF AIR ON THE LIVING SYSTEM.—When chemistry had at length succeeded in fully unfolding the constitution of the atmosphere, it was natural enough to conceive that variations in the ingredients of which it was composed, whether found naturally or produced in an artificial manner, would be productive of much variety of effect on the physical constitution ; hence were broached theories and opinions, respecting a more or less oxygenous atmosphere—and hence too, speculations were eagerly engaged in, on the probable influence that artificial airs might possess in controlling the actions, or abating the malignancy of disease. It happened that pneumatic chemistry came into play and repute, about the time that the public mind was agitated by the political convulsions that were going on in France and other countries ; and this circumstance, aided by the novelty and interest of the new views and doctrines, excited in the minds of some of the more ardent and enthusiastic, anticipations of the happiest results in the physical, as had already been supposed about to take place in the moral and political relations of man.

' See palsy dance, spasmodic action still ;
And asthma pace, without a puff, up hill.'

81. These golden visions have, however, passed by, and it even appears that the administration of medicinal aid, through the medium of the pulmonary organs is now become unjustifiably neglected : there certainly are cases in which the inspiration of air made artificially more than ordinarily vivifying, might much assist in invigorating the frame, and restoring a healthy tone of action to organs debilitated by protracted disease ; and it has often appeared to us probable, that a judicious employment of that singular combination of oxygen and azote, which constitutes the nitrous oxide, or protoxide of azote, as above noticed, might in the hands of judicious physicians, be made to apply beneficially under several conditions of nervous derangement.

82. To justify this opinion, we may here cite

a few examples taken from the researches of Sir H. Davy, of the extraordinary effects which followed the inspiration of this, as it had been called, laughter-producing gas.

83. Sir H. Davy first describes the effect it had upon himself as follows: 'Having previously closed my nostrils, and exhausted my lungs, I breathed four quarts of nitrous oxide from and into a silk bag. The first feelings were those of giddiness; but in less than half a minute, the respiration being continued, these feelings diminished gradually, and were succeeded by a sensation analogous to gentle pressure on all the muscles, attended by a highly pleasurable thrilling, particularly in the chest and in the extremities. The objects around me became dazzling, and my hearing more acute. Towards the last inspiration the thrilling increased, the sense of muscular power became greater, and at last an irresistible propensity to action was indulged in. I recollect but indistinctly what followed: I know that my motions were various and violent.'

84. These effects very soon ceased after respiration. In two minutes I had recovered my natural state of mind. The thrilling in the extremities continued longer than the other sensations.

85. The gas has been breathed by a great number of persons, and almost every one has observed the same things. On some few, indeed, it has no effect whatever; and on others the effects are always painful.

86. Mr. J. W. Tobin, (after the first imperfect trials) when the air was pure, experienced sometimes sublime emotions, with tranquil gestures; sometimes violent muscular action, with sensation indescribably exquisite; no subsequent debility —no exhaustion; his trials have been very numerous. Of late he has only felt sedate pleasure.

87. Mr. James Thomson. Involuntary laughter, thrilling in his toes and fingers, exquisite sensations of pleasure. A pain in the back and knees, occasioned by fatigue the day before, recurred a few minutes afterwards. A similar observation, we think, we have made on others; and we impute it to the undoubted power of the gas to increase the sensibility, or nervous power, beyond any other agent, and probably in a peculiar manner.

88. Mr. Thomas Pople. At first unpleasant feelings of tension; afterwards agreeable luxurious languor, with suspension of muscular power; lastly, powers increased both of body and mind.

89. Mr. Stephen Hammick, surgeon of the Royal Hospital, Plymouth. In a small dose, yawning and languor. It should be observed that the first sensation has often been disagreeable, as giddiness; and a few persons, previously apprehensive, have left off inhaling as soon as they have felt this. Two larger doses produced a slow unrestrainable tendency to muscular action, high spirits, and more vivid ideas. A bag of common air was first given to Mr. Hammick, and he observed that it produced no effect. The same precaution against the delusions of the imagination was of course frequently taken.

90. Mr. Robert Southey could not distinguish between the first effects, and an apprehension of

which he was unable to divest himself. His first definite sensations, were a fulness and dizziness in the head, such as to induce a fear of falling. This was succeeded by a laugh, which was involuntary, but highly pleasurable, accompanied with a peculiar thrilling in the extremities; a sensation perfectly new and delightful. For many hours after this experiment, he imagined that his taste and smell were more acute; and is certain that he felt unusually strong and cheerful. In a second experiment, he felt pleasure still superior; and has once poetically remarked, that he supposes the atmosphere of the highest of all possible heavens to be composed of this gas.

91. Robert Kinglake, M. D. Additional freedom and power of respiration, succeeded by an almost delirious, but highly pleasurable, sensation in the head, which became universal, with increased tone of the muscles. At last, an intoxicating placidity absorbed for five minutes all voluntary power, and left a cheerfulness and alacrity for several hours. A second stronger dose, produced a perfect trance for about a minute; then a glow pervaded the system. The permanent effects were, an invigorated feeling of vital power and improved spirits. By both trials, particularly by the former, old rheumatic feelings seemed to be revived for the moment.

92. Mr. Wedgewood breathed nitrous-oxyde gas, without knowing it was so. He declared it to have no effect, which confirmed him in his disbelief of the power of the gas. After breathing this some time, however, he threw the bag from him, kept breathing on laboriously with an open mouth, holding his nose with his left hand, without power to take it away, though aware of the ludicrousness of his situation; all his muscles seemed to be thrown into vibrating motions; he had a violent inclination to make antic gestures, seemed lighter than the atmosphere, and as if about to mount. Before the experiment, he was a good deal fatigued by a long ride, of which he permanently lost all sense. In a second experiment, nearly the same effect, but with less pleasure. In a third, much greater pleasure.'

93. The effects of a gas containing more than its natural proportion of oxygen have already been noticed, both upon vegetable and animal life; and it is so stimulating upon the respiratory organs as to have endangered, and even produced, inflammation, when unduly or injudiciously employed. That azote, and carbonic acid gases, breathed without any admixture, are speedily fatal to life, has also been made evident by a variety of experiments and observations.—Every one has heard of the destructive effects upon dogs, consequent upon these animals breathing the air of the *Grotto del Cani*; and when faintness, or suspended animation, is caused by holding the head over the fermenting vats of brewers, the cause here in operation is the same, viz. the inhalation of carbonic acid gas; and that the taking into the lungs of hydrogen gas is followed by marked results, the following, from among many other instances, may be taken in proof. It is extracted from the *Journal Britannique*, published at Geneva, by Prevost.

"Maunoir was one day amusing himself with

Paul at Geneva, in breathing pure hydrogen air. He inspired it with ease, and did not perceive that it had any sensible effect on him, either in entering his lungs or passing out. But after he had taken in a very large dose, he was desirous of speaking, and was astonishingly surprised at the sound of his voice, which was become soft, shrill, and even squeaking, so as to alarm him. Paul made the same experiment on himself, and the same effect was produced.

94. It may be said in objection to proposed medicinal trials of factitious airs, founded upon these and other observations, that their effects are too transient and uncertain for any practical inference that might otherwise be deduced from them; but it should be recollectcd, that even medicinal substances that are taken into the stomach, lay claim to no more than temporary excitation; and the degree of uncertainty that accompanies medicinal agency altogether is proverbial. In giving it, however, as our opinion that more might be made of pneumatic medicine than the fashion of the present day inclines to believe, we protest against any mis-use that may be made of our admissions, by unwarrantable enthusiasm, or bungling indiscrimination.

95. But it was not only on air artificially produced, but on that presented by the hand of nature at once, that speculation grew out of pneumatic discoveries; and air was talked of for the sick, as being more oxygenous, or more azotic, or more hydrogenous, according to the several circumstances of individual requirement. On this head, however, much of what was not only crude and inapplicable, but absolutely fallacious, was conceived and propagated. It has already been intimated, that the relative proportions of the air are generally preserved amidst every variety of place and circumstance; and we may here repeat, from a modern author, that the most celebrated chemists have been unable to discover any difference in the component parts of the atmosphere taken from different situations. Berthollet found the proportions the same in Egypt and in France. Dr. Thomson found them the same at Edinburgh at all seasons of the year; and Gay Lussac examined air brought from the height of 21,000 feet above Paris, and found it precisely the same as the air at the earth's surface: nor does it appear that an increased purity of the atmosphere would be so congenial to human life as has been supposed. It is well known, that the effect of inhaling an atmosphere with a superabundant proportion of oxygen is to produce a state of morbid excitement, and greatly to quicken the circulation. And so, it will be advanced, does a lightened atmosphere; but there is a wide difference between an aided and a stimulated circulation, between the increased action effected by external and mechanical means, and that produced by external stimuli. In the one case, the *materia motus*, or which is the same thing, the removal of resistance, is supplied from without, and calls for no additional exertion of the power of life. In the other, the same principle and the same effect are to be produced by direct sensorial excitement, and increased labour of the vital powers. In the feverish and inebriating ex-

citement of the one, the powers of life are too quickly exhausted. In the other, they are assisted in their labours, and enabled to maintain them for a longer period.—*Mansford, on the influence of situation on the duration of life.*

96. The author, from whom we have made the above quotation, has endeavoured to prove that health and longevity, as far as situation and air are concerned, are best secured by situations that are at once high, dry, and temperate. He supposes, that although there be no appreciable difference in the chemical ingredients of the air in any part of the habitable globe, yet that the difference of the weight of the atmosphere may, at different elevations, when it comes permanently to operate, be productive of permanent results.

97. An elevation, says he, of 500 feet, a very common variation in the surface of a hilly country, diminishes the average weight of the atmospheric pressing on the human body something more than a sixtieth part, or nearly 600 pounds; and although this reduction of pressure is not felt, it cannot be doubted, but that the removal of so large a degree of resistance, must give a greater freedom of action to the main spring of the circulation, as well as a greater power of distension to the vessels themselves, especially to the superficial vessels; both of which causes, like all others, will operate most powerfully on a diseased part.

98. This last effect is supposed to prove unfavourable to those individuals whose pulmonary system and general frame are already under the influence of morbid irritation; he therefore infers, that the situation which will prove genial and productive of longevity to the individual free from pulmonary taint, will prove the reverse to those who have such taint. He is disposed to think, that under these last circumstances, low and moist situations are best adapted to the demands of the case; and this opinion Dr. Wells has supported in the third vol. of Transactions of a Society for improving Medical and Chirurgical Knowledge. Sir James Mac Grigor, in his Observations on the Diseases of the Army in Portugal, also gives his testimony to the same effect. Dr. Harrison, whose situation afforded peculiar opportunities of observation, says, in an Address to the Medical Society of Horncastle, in Lincolnshire, that idiopathic consumptions, which were frequent in the wolds of that country, were seldom found in the fens; which he attributes to a difference in the component parts of the air in those situations. This observation was confirmed by Mr. Wayet, an experienced practitioner at Boston. Dr. Harrison also asserts, on the authority of Mr. Boucherett, M. P. for Great Grimsby, that consumption is a rare disease in Holland. We have also the testimony of Dr. Cogan, who resided several years in that country, that consumptions were much less frequent than in England. These concurrent testimonies, says our author, to which others might be added, would appear sufficient to establish, as a fact, that air impregnated with moisture, or with different effluvia, or mias mata, by which its purity is lowered, is rather favourable to the consumptive than otherwise.

But air answering to these conditions, is for the most part, to be found only in low situations; where the increased density of the atmosphere, and the resistance offered by it to inordinate action of the vessels, especially of their extreme branches, may be supposed to have a share in the beneficial effect.

99. We feel but little doubt that there is something both in the above statements, and in the inferences made from them by Mr. Mansford; at the same time, it should be observed, that the observation does not obtain universally of fenny countries being comparatively free from consumptive ailment. In Dr. Southey's Work on Consumption, we recollect to have seen two letters from respectable physicians in Chelmsford, stating, that disorders of the lungs were as common in the fenny, as in other parts of the county of Essex; and other remarks might be cited of the same import. At any rate, we are disposed fully to concur in the opinion advanced by the writer to whose speculations we are now referring, respecting the advantage of elevation and dryness, and moderate temperature, as conducing generally to the preservation of health and the maintenance of life: a short residence in an elevated place may be sufficient to invigorate the young convalescent; but that of the old man must be more permanent; he may perhaps quit it occasionally a short time with impunity, but he must consider it as his residence, where nine-tenths of his time are to be spent. Above all, those who have passed the whole, or the greater part, of a long life in an elevated situation, should be cautious of quitting it, to reside in a lower one. If lightening the atmospheric load can give fresh vigour to the vital actions, and thus prolong life; increasing it must necessarily, by depressing them, shorten it. The lives of Parr and John Jacobs soon terminated after quitting their native hills; the one of Jura, and the other of Shropshire.

100. Now, beyond these sensible qualities in the air, viz. of different degrees of temperature and humidity, and density, we fear the experimental observer can go but little way in predicating medicinal property. Contagious and infectious miasmata are indeed conveyed on 'the wings of the wind'—the *malaria* of the southern parts of Europe carries sickness and death with it wherever it travels; but still these changes and circumstances are only known in their effects; and we must be possessed of a nicer test of ascertainment, than any we have hitherto been furnished with, before the why and the wherefore of endemic and epidemic visitations can be satisfactorily made out. In a variety of instances catarrhal affections visit the inhabitants of this great metropolis with a frequency and force beyond what even the circumstances of temperature, or humidity, or dryness can account for; this being the case, the imagination is naturally led to something noxious in the air that surrounds us, of a specific nature; but no eudiometrical trials have satisfied us as to what this something is; and, for the present, at least, we must rest content with what mere observation, unassisted by science, imparts to us.

101. Even respecting the extent to which animal and vegetable poison impregnates the air of districts, and causes disease, opinion is not unanimous. It has been observed, for instance, that fevers of a certain kind and aspect, appear in much greater frequency where shallow stagnant waters abound; and these forms of disorder have thence been attributed to a poison generated by the decomposed vegetable matter of the marsh or morass; but of what this matter consists, and how it impregnates the atmosphere, are so far from being matters of demonstration, that some have derided altogether the notion of its specific agency, contending that the cold and humidity of the places in question, are quite sufficient sources whence to trace their diseases: and that temperature and humidity have a great deal to do with it, may be inferred from the especial unhealthiness of these regions where a rapid transition is made from the sultriness of the day to the damps and fogs of the night; but it certainly implies too much of a sceptical and generalizing disposition to deny, that besides the common physical and chemical conditions of an atmosphere, a something is superadded of a positive and specific nature.

102. In the counteraction of this something, however, it is pleasing to feel that much may be accomplished by the industry of man—nay, that much *has* been effected. During the last century, as stated by a modern writer, the greater part of Europe has been most happily and efficaciously acting upon this principle of counteraction—swampy lands have been drained—waste marshes cultivated—filth removed from our cities—air made to circulate through our dwellings—superstitious apprehensions respecting pestilential visits considerably lessened—and, adds the writer from whom we are now extracting, 'in consequence, shall we say, without incurring the charge of assuming where we ought to prove, the greater part of Europe, and our own country and cities in particular, instead of harbouring and fostering contagion into venomous, and permanent, and wide spreading pestilence, have merely afforded a short and niggardly entertainment to the mildest forms of contagious fever.' See *CONTAGION* and *INFECTION*.

103. We now bring this article to a conclusion, by subjoining the following observations on the medicinal qualities of air, from the Medical Dictionary of Dr. Parr.

104. 'The physical or medicinal qualities of the air have occasioned numerous disquisitions. But extensive enquiries, the comparison of the tables of mortality, and experience long continued, have allowed us to draw few conclusions that will bear the test of careful examination. In spring we find inflammatory complaints, in autumn bilious diseases; in every season fevers, in the commencement inflammatory, in the conclusion more or less of an opposite type. To be more particular, continued cold produces that tension of the fibres, that strong and steady action which we style inflammatory diathesis; high situations with a pure bracing atmosphere produce similar effects. These are partly owing to an excess of oxygen; but in a great measure

to moderate continued cold. A previous moist temperate winter, which predisposes to scrophulous complaints, will at this period produce the most fatal consequences in hectic cases. The fever will increase, the ulceration proceed with rapidity, and the heat of the ensuing summer close the scene. Those, however, who are moderately healthy, and not peculiarly robust, will find a winter of no extreme cold healthy; and the opening spring expanding the fibres, will give a genial glow and new life to every organ. Summer of course may produce its own diseases; but if we peruse the history of Epidemics, we shall with difficulty trace any particularly bad effects of the heat, till the evenings begin to cool, the fruit to be plenty, and the bile to become a conspicuous cause of disease, from its accumulation and excessive discharges. Winter again recurs; and Dr. Heberden has endeavoured to show, from the bills of mortality, that it is a fatal season. 'It may be so in general; old people resist cold with difficulty, and the catarrhous suffocations, asthma, and similar complaints, are often fatal at this period. In our experience, however, it is not the cold, but the early warmth of spring succeeding cold, which is most injurious; the constitution, braced by cold, cannot bear the subsequent relaxation. A long damp summer has had similar effects.'

105. Philosophers have taught us how much pressure we bear from the atmosphere; and of course from the diminution of that pressure, we shall feel the want of tension or tone, which results from the removal of any support. Thus, when the air is lighter we find a languor come on—when heavier, we find our spirits are more brisk and lively. The whole, however, is not owing to the absolute weight of the air, but in part to its elasticity; or rather our feelings of health and activity are in the compound ratio of both. Thus, at the height of from 1200 to 2000 feet above the level of the sea, the pressure is greatly diminished; but we feel increased activity, as we are in general above the region of the clouds, and the air is more elastic; and the languor felt in very high situations is not uniform or constant; so that it cannot depend on a constant cause. During rain, the mercury in the barometer is not depressed half an inch. Yet, we feel more languor than on the tops of mountains, where it has probably fallen from five to ten inches.

106. In other respects, the physical properties of the air seem to have little influence. The warmest and longest summers are often healthy; the coldest winters, with the exception of inflammatory complaints, are the same. The warmest weather, with the dampest fogs, have been followed by no peculiar epidemic. It is what Hippocrates long since called the *τὸ θεῖον*, something divine or inexplicable, that produces fevers, or similar diseases; but before we notice 'the divinity that stirs within us,' we must add a few remarks on our situation, as connected with the physical properties of the air.

107. A dry elevated spot, on a gravelly soil, is said to be most wholesome, especially if sheltered from the east wind. Elevation is, however, relative; light clouds float in the atmosphere,

about 1000 feet above the level of the sea, and the healthier spot is said to be some ~~way~~ above this elevation. This appears, however, to be fanciful; and it has not been proved that atmospheric moisture alone is injurious. In dry gravelly elevated spots, experience has fixed the most salutary residence for consumptive cases; yet in these oxygen seems to abound, which is peculiarly injurious in such complaints; and air of a lower quality, as it has been styled, is seemingly as good, in the opinion of some preferable. In asthmatic cases, elevated spots are manifestly injurious. In fact, theorists may declaim, but facts give the lie to the most plausible declamations. A change is often necessary; and from the effects of the change, the conduct proper for each individual must be ascertained.

108. It is observed by some authors, that vaults, corn magazines, and apple garrets, &c. should open to the north; for that point is invariably proper; but the south and west are constantly improper. The most healthy exposure, if a house is to be built, is said to be found by cutting one of the trees that grow there transversely with a saw, observing the rings; the side of the tree on which the distances between each ring is widest, is the most healthy exposure, and the windows of the house, all other circumstances being the same, should ever face that way.

109. We have mentioned the effects of the east wind in general, and we shall now notice them more particularly, though it cannot be yet determined whether they belong to the chemical or physical properties of the air. The atmosphere, while the east wind prevails, is lucid; and even when clear, the sun has not its brilliant hue. The strength is not equal to the usual exertions, the respiration not free, the spirits not lively. Asthmatics and hypochondriacs feel it severely. Yet it is often dry, and when it rains during a south-east wind, its fall is frequently periodical, extending only to twelve or twenty-four hours. While the clouds constantly display a promise of fair weather, there is seemingly a perpetual contest between the causes of rain and their antagonists, whatever they may be.'

110. As we have now instruments by which the quality of the air may be measured, it might be presumed that these would inform us of the cause of this singular state of the atmosphere. The east wind is not peculiar to any situation, so that it is not injurious from passing over a baleful desert, or a successive series of marshes; nor does the eudiometer show any particular ingredient which may impair health or induce disease. The assistance which this instrument affords to the medical chemist is indeed inconsiderable. In crowded cities, and the most apparently healthy situations, remote from 'the busy hum of men,' its results are nearly the same. Chemists must decide whether this similarity in the appearances are owing to the imperfections of the instrument, or whether the injurious qualities of the air are not cognizable by it.

111. The aerial pathology has not yet been successfully cultivated. Man can live and enjoy health from the heat of twenty-eight to one

hundred and eight degrees of Fahrenheit. He can exist in a constant fog, where the hygrometer proceeds beyond the extreme of humidity; and in air which supports the mercury only at twenty-two or twenty-three inches, he is robust and active. Sudden changes are injurious; but the injuries are often transitory or inconsiderable; or if severe, producing only temporary or acute diseases. Yet the air is accused as the cause of numerous diseases, and it really is so. Sudden cold, checking perspiration, will apparently produce almost every form of the ptyrexia. Partial cold will produce rheumatism; damp air, catarrhs; and, in old people, those diffusions which are called humours, as asthmas, and catarrh suffocavit. The continued heat of summer occasions bilious disorders; and the cold of winter, return of the more active inflammations. The air, however, is chiefly a vehicle of injurious effluvia, some of which only can be ascertained. Marsh miasmata, as they are styled by pathologists, are the causes of numerous intermittent and remittent fevers, as well as those apparently of a more continued form. It has been ascertained that a clayey soil, when moistened, will attract the oxygen of the air, and leave the azotic part not sufficiently guarded to support the vis viva; and it is found that districts become unhealthy, chiefly when the earth begins to appear in consequence of a diminution of the water.

It is singular that Linnæus, with a view to prove the cause of intermittents to be an argillaceous earth, has traced very minutely the prevalence of intermittents in clayey countries a circumstance which may be explained from the views just assigned. To this diminution of the oxygen must be added a larger and unusual proportion of inflammable air, from the parts of marshes still covered with water. To these conjoined causes many epidemics are owing; and when the changes in the physical properties of the air appear to produce fevers, they act only as exciting causes of these miasmata.

112. Many objections might be taken to some of the above views of our ingenious author. We shall only advert to two particulars, in which there appears to be a fallacy in Dr. Parr's reasoning. The unhealthiness of an argillaceous, or clayey soil, seems to be rather referrible to the difficulty with which moisture percolates through it; and the extreme, or, if it may be so said, evaporating dryness of east winds appears to be in a great measure the cause of their peculiar unhealthiness. Dr. Hutton, of Edinburgh, found that a wetted thermometer, exposed to a moderate east wind, in the month of March or April, sunk between eight and nine degrees below the temperature of the air, but in the driest summer weather, it never fell more than four, and often only two or three.

- WIND**, easterly, why noxious, 112.

AIR, in music, is taken in different senses. It is sometimes contrasted with harmony; and, in this sense, it is synonymous with melody in general. Its proper meaning is, a tune, which is set to words, or to short pieces of poetry. Sometimes it denotes simply the treble part of a musical composition. There are three kinds of airs in dramatic music; the aria cantabile, or the air of song; the aria di bravura, the air of execution; and the aria parlanta or speaking air. The first is usually applied to the pathos, or effect of music; the second, (bravura) to prove the brilliancy and difficulty of execution; and the parlanta to that music which approaches nearest to the natural manner of earnest speech. This last is therefore used in recitative. These and the several corresponding movements are varied to infinity, whence also air, with variations, a melody varied, ad libitum, by the compiler.—Air tendre, an air, so denominated for the tenderness of its style.

In operas, the name of air is given to such pieces of music, as are formed with measures and cadences, to distinguish them from the recitative; and, in general, every piece of music is called an air, which is formed for the voice, or even for instruments, and adapted to stanzas,

whether it forms a whole in itself, or whether it can be detached from any whole of which it forms a part, and be executed alone.—If the subject admits of harmony, and is set in parts, the air is, according to their number, denominated a duett, a trio, a quartetto, &c. We need not follow Rousseau and others in their endeavours to investigate the etymology of the word air. The curious may consult this whimsical writer's article in the *Dictionnaire de Musique*. In modern music, there are several different kinds of airs, each of which agrees to a certain kind of dancing, and from these dances, the airs themselves take their specific names. The airs of our operas, are, if we may be permitted the expression, the canvas, or substratum, upon which are painted all the pictures of imitative music; melody is the design, and harmony the colouring; every picturesque object selected from the most beautiful parts of nature, every reflected sentiment of the human heart, are the models which the artist imitates; whatever gains attention, whatever interests the soul, whatever charms the ear, or causes emotion in the heart, these are the objects of his imitation. See *IMITATION*. An air which delights the ear, and discovers the talents of the composer; an air invented by

genius, and composed with taste, is the noblest effort of music: it is this which explores the compass, and displays the delicacy, of a beautiful voice; it is this in which the charms of a well-conducted symphony shine; it is by this, that the passions, excited and inflamed by nice gradations, reach and agitate the soul through the avenues of external sense. After hearing a beautiful air, the mind is acquiescent and serene: the ear is satisfied, it remains impressed on the fancy, it becomes a part of our essence, we carry it with us, we are able to repeat it at pleasure; without the ability acquired by habit to breathe a single note of it, we execute it in our imagination, in the same manner as we heard it: one beholds the scene, and the musician: one hears the accompaniments and the applauses. The real enthusiast in music never forgets the beautiful airs which he has heard: when he chooses, the opera recommences. The words to which airs are adapted, are not always rehearsed in regular succession, nor spoken in the same manner with those of the recitative; and though, in general, they are very short, yet they are interrupted, repeated, transposed, at the pleasure of the artist. They do not constitute a narrative, which once told is over: they either delineate a picture, which it is necessary to contemplate in different points of view, or inspire a sentiment in which the heart acquiesces with pleasure, and from which it is neither able nor willing to be disengaged: and the different phrases of the air, are nothing else but different manners of beholding the same image. This is the reason why the subject of an air should be one. It is by these repetitions properly placed, it is by these redoubled efforts, that an impression, which at first was not able to move you, at length shakes your soul, agitates and transports you out of yourself: and it is likewise upon the same principle, that the runnings, as they are called, or those long, mazy, and inarticulated inflections of the voice, which, in pathetic airs, frequently seem, though they are not always so, improperly placed; whilst the heart is affected with a sentiment exquisitely moving, it often expresses its emotions by inarticulate sounds, more strongly and sensibly than it could do by words themselves. The form of airs is of two kinds. The small airs are often composed of two strains, which ought each of them to be sung twice; but the important airs in operas are frequently in the form of rondeaus.

AIR, in mythology, was adored by the heathens, under the names of Jupiter, and Juno; the former representing the superior and finer part of the atmosphere, and the latter the inferior and grosser part. The augurs also drew presages from the clouds, thunder, lightning, &c.

AIR, in painting, &c. denotes the manner and very life of action; or it is that which expresses the disposition of the agent. It is sometimes also used in a synonymous sense with gesture or attitude. Thus Correggio and Guido are said to have excelled in the *airs* of the heads, as well as of the whole figures they painted.

AIR, in surgery, has a medicinal efficacy that has attracted the consideration of various eminent writers. Fixed air, or carbonic acid gas, has been applied by means of the fermenting

cataplasms to fetid and gangrenous sores. It has also been used in malignant ulcers of the fingers, nose, &c. as well as in caries of the bones. Mr. Witstock recommends the application of it by means of a receiver or air bell, connected with a flexible tube or pipe sufficiently air-tight—supposing the fixed air to be produced from the effervescence of fixed alkali and vegetable acid. Others impregnate water with the gas, and soaking compresses therein, lay them on the seat of the disorder. Mr. Loeffler, a German surgeon, has recommended a particular apparatus for this purpose, which may be easily constructed, and which he employs for saturating water with fixed air, by the mixture of chalk and vitriolic acid, or during the process of fermentation. When we wish to apply the air to a cancerous breast, for example, we are to fill a bladder with the air as it rises from the above mixture. Then introduce a tube, fixed to its orifice into another bladder, which is to be cut round in such a manner that it can be applied like an open bag to the breast, and held close to it with the hands. When it is fastened below, it must be untied, so that the fixed air may pass out of the first into the second bladder, and find access to the ulcerated part. In order to facilitate this process, a gentle degree of pressure is to be applied to the bladder, and as one bladder will not be sufficient, a number of them should be provided in readiness, and filled for immediate use in succession. This operation is to be continued half an hour or longer each time, and repeated twice or thrice a day.

AIR, in the menage, is the artificial motion of a taughorse; as the demivolte, curvet, capriole, &c.

AIR, CIRCULATION OF, IN ROOMS. To render the circulation of air perceptible, let the air of a room be heated by a strong fire, whilst that of a contiguous room is cold; then let the door between those two rooms be opened, in which case the hot air of one room being lighter, will pass through the upper part of the opening of the door into the cold room; and, on the contrary, the cold air of the other room being heavier, will pass into the former room through the lower part of the opening. Accordingly, it will be found, that applying a lighted candle at the top, in the middle, and at the lower part of the opening between the two rooms, a strong current of air will appear to pass from the hot into the cold room near the top; a contrary current of air will appear to pass from the latter into the former room near the lower part of the said opening, as may be clearly perceived by the direction of the flame of the candle, whilst in the middle there is little or no motion at all. It is for the same reason that when the fire is lighted in a grate, a strong current of air is occasioned to enter the room, which may be felt by applying the hand near the key-hole, or other such small opening, if the doors and windows are shut; for the air over the fire, being heated, becomes lighter, and ascends into the chimney; consequently other colder air must supply its place, which forces its way through all the small openings it can find. Were a room with a fire in it to be perfectly closed, excepting the chimney, the air in it would soon become unwholesome for respiration, and the fire would be

soon extinguished, besides other inconveniences. Hence it appears that those persons mistake who expect to keep the air of a room sweet and wholesome, especially for convalescents, by accurately stopping all the smallest openings that admit fresh air. When the current of air that enters into a room is on some side of it, and falls immediately on persons of delicate constitution, it may be injurious. In that case, such opening should be closed; but at the same time another should be made for admitting fresh air, in a more convenient part; for a circulation of air, especially in rooms where a fire is kept, is not only salutary and useful, but is absolutely necessary. See PNEUMATICS.

In an ingenious publication, entitled, a Practical Treatise on Chimneys, there are the following useful remarks, on the best method of admitting air into a room. The author directs a vent-hole to be made near the top of the room, in order to expel the heated and contaminated air, and says, that 'this might be done by means of a small tube opening into the room, either in or near the ceiling; which should be carried to the top of the building, or be made to communicate with the external air, by a small perforation through the wall at the roof of the room; by means of either of which, a proper circulation would be established, and the foul air carried off. For the fire would no sooner have warmed any particle of air within the room, than these would be greatly expanded, and rise immediately upwards, so as to fill the higher parts of the room with rarefied air; and as other particles would be successively heated and rarefied in their turn, by their expansive force they would press upon the sides of the apartment in every place, so as to force the lightest particles through the opening, left for that purpose, in the top of the rooms: by which means the foul air would be gradually drawn off, without descending again into the lower regions.' But in order to admit fresh air into the room, 'Let,' says he, 'another opening be made in the ceiling of the room, having a communication with a small pipe that should lead from thence, either to the outside of the wall of the house, or to any other part of the building that might be judged more convenient, where it should be bent, and conducted downwards, till it reached the ground; where it should be left open, to communicate with the external air. In this situation, the cool external air would be forced in at the lower opening of the tube, and made to ascend into the apartment, in proportion to the quantity that escaped towards the higher regions, by means of the ventilator. And as that weighty air would no sooner enter the room, than it would tend towards the floor by its own natural gravity, it would gradually mix with the heated air in its descent; become, in some measure, warmed by that means, and equally dispersed through the room, so as slowly and imperceptibly to reach the candles and the company in the room, and supply them with a sufficient quantity of fresh and wholesome air, without the inconveniences to which the company are subjected, by the usual way of admitting fresh air.' Such of our readers as have been unaccustomed to specula-

tions of this sort, will be at a loss to comprehend in what manner two holes, both of them in the roof of the room, and communicating with the air, without any valve, or other contrivance for opening or closing of themselves, should yet answer the two very opposite purposes, the one, of constantly bringing cool air into the room without emitting any warm air, and the other, of as constantly emitting warm and admitting no cool air. They will observe, that the one of these tubes communicates with the atmosphere, at the bottom of the house, and the other towards the top: the opening of the one is beneath the level of the room, that of the other above it. Now, as the air is more dense at the surface of the ground, than at the height above it, the warm rarefying air will naturally issue at the opening where it meets with least resistance, which must invariably be through that which opens to the external air at the greatest height; and as the cool air will naturally be pressed into the room, by that opening where the air is most weighty, this must invariably be by that which is nearest the surface of the earth.

A friend of Dr. Franklin's, whose observations on a topic of this kind are always as useful and practical, as they are philosophical, writes thus:

'Dr. Franklin was, if I mistake not, the first who observed that respiration communicated to the air a quality resembling the mephitic; such as the Grotto del Cano near Naples. The air impressed with this quality rises only to a certain height, beyond which it gradually loses it. The amendment begins in the upper part, and descends gradually until the whole becomes capable of sustaining life. The Doctor confirmed this by the following experiment. He breathed gently through a tube into a deep glass mug, so as to impregnate all the air in the mug with this quality. He then put a lighted bougie into the mug; and upon touching the air therein the flame was instantly extinguished; by frequently repeating this operation, the bougie gradually preserved its light longer in the mug, so as in a short time to retain it to the bottom of it; the air having totally lost the bad quality it had contracted from the breath blown into it.'

'At the same time that the lower part of the air is thus affected, an acrid noxious quality may be communicated to its upper part in the room, occasioned by the volatile putrescent effluvia of the persons enclosed therein. 'It is surprising,' says Sir John Pringle, in his observations on the diseases of the army, fourth edit. p. 109, 'in how few days the air will be corrupted in close and crowded wards; and what makes it hard to remedy the evil, is the difficulty of convincing either nurses or the sick themselves, of the necessity of opening the windows and doors at any time for a supply of fresh air.'

'It may be inferred from the preceding account of mephitic air, that such air can be but little altered by a ventilator in the ceiling of a room; and Dr. Franklin justly concluded, that in crowded rooms, and especially in bed-rooms in dwelling-houses, a current of air should be kept up in the lower part of the rooms, to carry off what is thus affected. He approved of the use of chimnies for this purpose, especially when

the current is quickened by a fire. Even when there is not any fire in the chimney, a current of air is constantly kept up in it, by its ascending or descending in the flue, as the weight of the internal or external air preponderates. This creates a kind of tide in the flue, conduced much to the healthiness of air in rooms: and hence we may see the injudiciousness of having chimney boards which fit closely, and thereby prevent a salutary circulation in the air. Hence also in warm weather we may account for liquors or other things kept in a chimney being cooled, and more so if means are used to create an evaporation around them.

'Every person has an atmosphere of his own, he observed, heated by the warmth of his body, which can be dissipated only by motion in the circumambient air. Thus in warm weather wind cools the body, by carrying off the personal atmosphere, and promoting at the same time a more free evaporation of the effluvia arising from the body. This creates a great degree of coolness on the skin. The personal atmosphere can be but little affected by a ventilator in the ceiling of a room, unless the admission of external air is so directed as to act principally on the air surrounding those in the room. Dr. Franklin, when consulted on ventilating the House of Commons, represented that the personal atmosphere, surrounding the members, might be carried off by making outlets in the perpendicular parts of the seats, through which the air might be drawn off by ventilators, so placed, as to accomplish this without admitting any by the same channels. It will appear from what has been said, that windows placed high in the walls of churches, or rooms intended for large assemblies, can contribute but little towards correcting the mephitic quality of the lower part of the air, or towards carrying off the personal atmospheres.'

'Dr. Stephen Hales endeavoured to suggest an easy and effectual way to carry off such vitiated air. But his ventilators were attended with the inconveniency of occasioning smoky chimnies, by drawing off so much air, that there was not a sufficiency left to keep a current strong enough to carry the smoke up the chimney, unless a door or window was left open. And the circulating ventilators in windows were intended for refreshing the air in rooms, without affecting the current of air up the chimney; but they did not affect the mephitic air, nor the higher air near the ceiling of lofty rooms, which is most vitiated with putrescent particles; and they were besides often out of repair.'

'Instead of either of these, Dr. Franklin proposed that openings should be made close to the ceilings of rooms communicating with a flue, which should ascend in the wall close to the flues of the chimnies, and, where it can be done conveniently, close to the flue of the kitchen chimney; because the fire burning pretty constantly there, would keep the sides of that flue warmer than those of the other chimnies; whereby a quicker current of air would be kept up in the ventilating flue. Such a flue might be carried from the vaults or under ground offices. This would render them drier, without altering their temperature much as to heat or cold. These

ventilating flues would cause a constant discharge of the volatile putrescent effluvia without interfering with the current of air up the chimnies, while the current towards the chimney would carry off the mephitic air below. These ventilating flues would be peculiarly beneficial in bed-rooms, the ceilings of which are low,

'Dr. Franklin mentioned an instance of number of Germans, who on their arrival in Pennsylvania were obliged to live in a large barn; there being at that time no other place of residence fit for them. Several small windows were made on both sides of the barn under the eaves. These windows were kept constantly open, even during a severe frost in the winter; and this without any detriment to the health of the Germans. Prejudice, said he, has raised so great a dread against cold air in England, that such openings would make persons shudder at the thought of being exposed to so great a degree of cold: and therefore I did not dare to recommend a practice, the good effects of which I had known. The dormitory for the youths of Westminster school is a similar instance; for the glass put in their high lofty windows is soon broken, but seldom repaired; yet without prejudice to the health of the youths.

'An attentive observer will soon be convinced,' continues our author, 'that there is a current of warm air which ascends in the room from the chimney, while a fire burns. Dr. Franklin showed that this was the case, by the following experiment. He suspended by a thread, a piece of pasteboard cut in a spiral form. The thread was fastened to the chimney-piece, so that the pasteboard drawn out in a spiral form, came near to the edge of the chimney. The constant current of warm air, heated by the fire, gave a continued circular motion to the pasteboard. This warm air ascending to the ceiling, there spread, and kept a constant motion in the upper part of the air. The warm air thus ascending, coming into contact with the cool walls, and being thereby condensed, becomes heavier, and so falls along the sides of the walls. Also the glass in windows being exposed to the temperature of the external air, in cold weather, becomes colder than any other part of the room: therefore more sensibly descends, as may be seen by approaching a lighted taper to a window. The flame is then carried downwards by the air; or if the flame is extinguished, the smoke will more clearly shew this truth, by descending along the window till it meets the air of an equal temperature. This will be the case, however tight the window; and the more so, the brighter and stronger the fire is, and the colder the external air; the circulation of the air being thereby quickened. This accounts for the familiar caution of avoiding to sit in or near a window. This circulation of the air is yet more evidently proved by the following instance: When there is a bright strong fire in a close room, open the door and present immediately a lighted candle to the upper part of the doorway, the flame will bend outward; though warm air in the higher part rushes out, lower the candle gradually, and the strength of the current outward will lessen by degrees, as the candle is lowered,

till it comes to a space in which the flame shall rise upright: continue to lower the candle gradually, and then the current of cold air inward will gradually increase and more strongly bend the flame of the candle inward. This will be the case even in frosty and windy weather.— May it not be inferred from this circumstance, of so strong a current of air outwards in the upper part of the door-way, that an opening over or in the upper part of the door in the ward of an hospital might be of advantage, especially if there is no ventilating flue in the ceiling? By such means a circulation of the air in the upper part of the ward could be constantly kept up; and thereby a vent would be given to the volatile putrescent particles. This vent might remain open at all times, without any prejudice to the patients.

‘What is said on this subject by Dr. John Armstrong, a gentleman no less remarkable for his benevolence than for his judgment and fine taste, may be properly mentioned here. ‘A constant circulation of fresh air is so necessary, so important in fevers, and in all feverish disorders, that it ought to be particularly considered in the construction of houses. It would be well, if in all the apartments of every house, but especially in bed-chambers, the upper sashes of every window were contrived to let down; for by this means the admission of fresh air would at all times be perfectly safe; except during a raw, damp, foggy night; as the body, even when under such a sweat as could not without danger be interrupted, may receive all the refreshing, restorative, and invigorating influence of the air, without being exposed to a stream of it; meantime, where this is wanting, the best method to supply it, is by drawing the bed-curtains close, now and then, for a few minutes at a time, while a free passage is made to the foul air, by opening the doors and windows.’ *Medical Essays*, page 22.

‘The noxious vapours that fill a sick room are not only offensive, but dangerous to those who continue in it for any time. If dangerous then to people in health, how detrimental must they be to one oppressed and struggling under an enfeebling disease! It is a common thing in a campaign to distribute the sick soldiers, ill of malignant fevers, in open barns, where the putrid volatile poison is in a short time dissipated.

‘There is in a volume of the Mémoirs et Observations recueillies par la Société Economique de Berne, a letter concerning the health of the inhabitants of the Pays de Vaud; part of which I beg to present here as bearing a near analogy to this subject. The letter is written by a most accurate and judicious clergyman. ‘One fact,’ says he, ‘deserves to be noticed. Taking one year with another, a greater proportional number always die in towns than in villages. But whence comes it, that when epidemic diseases prevail, the mortality takes quite a different road; that is, it is much more considerable in villages than in towns? I have taken great pains to find out the cause of this phenomenon, and am apt to impute the difference to the difference of habitations. The poor in cities and great towns dwell in houses originally not intended for them; but

which being so old and past repairing, as to be no longer tenable by persons at their ease, fall to the lot of the lower class of people. In these houses the rooms are spacious, cold as ice, where the air plays freely around, with doors and windows that do not half shut. The inhabitants of these shattered houses are pitied; and yet the very circumstance of their being out of repair, is what contributes to the health of those who live in them, and facilitates their cure when diseases reign.’

‘The more I see of hospitals, the more I am convinced of the great want of instructions on duly ventilating them.’

The many excellent observations of a variety of eminent men, on a universally interesting topic, may excuse the length of this extract from Mr. SMALL’s ‘Essay on Ventilation, containing Dr. Franklin’s Observations on the Subject,’ lately published in the complete works of Dr. F. 6 vols. 8vo. See VENTILATION.

The ‘Philosophical Survey of Ireland’ has this singular passage:—‘Smith mentions a Dr. Lyne, of Cork, who, for the last fifty years of his life, never glazed a window in his house; four of which he had in his bed-chamber, two on each side of his bed. It is remarkable, that during all that time, nobody died in the house, till he was himself carried off by the small pox, at the age of eighty-five.—After the windows were glazed by his own son, death became a frequent visitor.’

AIR-BAG, in botany, or FOLLICULUS, a small distended seed-bag, or bladder, opening on one side, as in the periwinkle, or bladder-sena, and having the seeds loose in it. Also a name given by Withering to little bags filled with air in other parts of plants, as at the root of the utricularia.

AIR-BALLOON, in aeronautics, the machine that has of late been so frequently used for the purposes of aerial navigation. See AERONAUTICS.

AIR-BLADDER, in ichthyology, vessels containing elastic air, found in the bodies of fish, and sometimes called the swim, or swimming-bladder, sometimes the sound. This membranous bag by means of which, fish elevate, sustain, and sink themselves in water, lies close to the back-bone, and is furnished with a strong muscular coat, by which it has the power of contraction and dilatation. Because it is connected with a glandular substance, which contains a quantity of red blood, some have supposed that the air contained in the swimming-bladder is derived from this substance. Two processes or appendices issue from its anterior part, and terminate in the fauces. But cartilaginous and cetaceous fish, (or sea-animals,) are wholly without air-bladders. This membrane was discovered by observing, that a bubble of air, in rising from the bottom of a fluid, dilates till it reaches the top, by reason of the continual diminution of the weight, or pressure of the incumbent water. The air, in the bladder, is like the bubble, more or less compressed, according to the depth the fish swims at, and takes up less or more space; and consequently the body of the fish, part of whose bulk this bladder is, is greater or less according to the several depths, though it retains the same

weight. Now by a rule of hydrostatics, if the fish in the middle region of the water be of equal weight with an equal bulk of the water, it will rest there, without any tendency either upwards or downwards; and if the fish be deeper in the water, its bulk becoming less by the compression of the bladder, and yet retaining the same weight, it will sink and rest at the bottom: on the other hand, if the fish be higher than the middle region, the air dilating itself, and the bulk of the fish consequently increasing, without any increase of the weight, the fish will rise and rest at the top of the water.

Fish have been supposed to have some power of emitting air out of the bladder, and afterwards out of their bodies; also that when there is not enough, to take in more air, and convey it to this bladder; in which case it will be easily accounted for, that there should be always a proper supply of air in the bodies of fish, according to the depth of water they live in. Perhaps also, by some muscle, the fish can contract this bladder beyond the pressure of the weight of water; and by its sides, or some other defence, keep off the pressure of the water and permit the air to dilate.

In lieu of a bladder, the water-snake, has a large membranous air-bag on its back, which empties and fills with air at pleasure, by an aperture, which it can shut very close, by means of a sort of valve, so that the least globule of water cannot enter without its consent. By this artifice it can enlarge or lessen the bulk of its body, and inhabit all depths of the water. Ray has conjectured that it is by the help of water, which they take in and let out by two holes in the lower part of their abdomen, near to the ventricle, that they ascend and descend; that they sink in the water, by letting in some of it at these holes; the orifices whereof are opened and shut at pleasure, by means of proper muscles, and the water being thus received into the abdomen, which it contracts or dilates at pleasure, that portion of its body becomes, in fact, its air-bladder. In some fish, as carp for instance, the air-bladder is divided into two compartments, in others into three. Some maintain that all fish which have teeth in their jaws, have only a single air-bladder; but this seems no certain criterion. If the air-bladder of a fish be pricked or broken, the fish presently sinks to the bottom, unable either to support or raise itself up again. Flat fishes, as soles, plaice, &c. which always lie grovelling at the bottom, have no air-bladder. Dead fishes are found swimming on the surface of the water, because the muscles of this membrane cease to act; and their bellies are uppermost, as the backbone cannot yield, and the distended sac is protruded into the abdomen: the back becomes consequently heaviest at its upper part.

In most fishes there is a channel, leading from the gullet, or upper orifice of the stomach to the air-bladder, which doubtless serves for conveying air into it. In a sturgeon it has been observed, that upon pressing the bladder the stomach presently swelled; so in that fish it seems the air passes freely both ways; and possibly the fish may have a power to raise up this valve, and let out air on occasion.

In a variety of other fishes there are communications with some parts of the alimentary canal, particularly the oesophagus and stomach. The salmon has an opening from the fore end of the air-bladder into the oesophagus, which is surrounded by a kind of muscular fibres. The berring has a sort of funnel, connecting the bottom of the stomach with the air-bag; by which the air probably comes out from it.

Dr. Priestley supposes that the air, enclosed in the air-bladder of fishes, serves some further purpose in their economy besides that of enabling them to rise or sink in water. Some fish have no air-bladder, and yet rise or sink without difficulty. That fishes cannot live without air is a well known fact, established long ago by the experiments of Mr. Haukshee. The fishes he employed were gudgeons, which are lively in the water, and which subsist for a considerable time when taken out of it. Having put three of these into a vessel of water which had no communication with the external air, and which was designed to resemble a frozen pond, and other threæ into a vessel of water exhausted of its air; he observed, that in about half an hour the latter manifested signs of uneasiness by an unusual motion of their mouth and gills; and the former frequently ascended to the top of the vessel in which they were confined, and then sunk down again, without any sensible alteration. After five hours the gudgeons in the vessel exhausted of its air, became less active; and in about three hours more those in the confined air lay at the bottom of the vessel with their bellies upwards, without moving their fins or tail, but indicating life by a motion with their mouths. On uncovering the vessel, they revived in two or three hours, and were perfectly well next morning; at which time those in the vessel purged of its air were also recovered. When this last vessel was put under the receiver of an air-pump, and the air was exhausted, they all died. When the air was exhausted they remained at the top, but on its re-admission, they sunk to the bottom. It is not easy to explain the manner in which fishes are supplied with air, nor the benefit they derive from it; nor are the nature and qualities of the air, contained in their air-bladder, satisfactorily ascertained. Priestley confined minnows, and other small fish in water without any access of common air, till they died, and upon examining this water, he found that it was somewhat worse than air in which a candle just goes out. Hence he infers, that air contained in water, in an unelastic state, is as necessary to the life of fishes, as air in an elastic state is to that of land-animals. Upon putting fish into water impregnated with phlogisticated air, he found that it was not only injurious, but in process of time fatal to them; although he observes, that fish, like insects and some other exsanguinous animals, can live a considerable time without any thing equivalent to respiration. In mentioning some experiments on the state of the air, which is contained in the air-bladder of fish, he remarks, that when these are taken out of the fish, the air cannot be discharged from them by pressure through any existing aperture, but he was always obliged to cut or burst them. The air itself, obtained from

many of them was not affected by nitrous air; but that of some, particularly of roaches, exhibited slight indications of the effect of this test. It thus appears, that he seldom met with oxygen, and with that only in a small quantity. Exp. and Obs. relating to Nat. Philos. vol. ii. p. 138. Fourcroy found that for the most part, the air contained in the air-vessel of the carp, was perfectly pure azotic gas, though it sometimes contained a small quantity of carbonic acid gas. From the nature of the fluid, he infers, that the air in the bladders of fishes is produced in the stomach. Ann. de Chem. i. 47. Dr. Monro, in his lectures, led his auditors to conclude, that it was fixed air. But Dr. Brodbelt of Jamaica, collecting about a quart of the air from the bladder of a large sword-fish, which, he says, consisted of innumerable cells that had no communication with one another, found to his surprise that it was oxygen. A flame was brightened and an ignited stick was rekindled by it; and it was so strong and pure, that the common experiment of a piece of steel-wire, heated and put into it, succeeded well, and threw out a most vivid light when melting. This pure air, he supposes, is adapted to serve the purposes of life, when the fish is far below the surface of the water. *Duncan's Ann. of Med.* for 1796, p. 393.

AIR-BLADDERS, or **AIR-BAGS**, in ornithology, cells or receptacles of air in the bodies of birds, which are found to be lodged both among the fleshy parts, and in the hollow bones of these animals. Hunter contends that the air-cells, which are found in the soft parts of birds, have no communication with the cavity of the common cellular membrane of the body; some of them communicate immediately with one another; and all of them may be said to have a communication together, by means of the lungs as a common centre. Some are placed in larger cavities, such as the abdomen; others are so lodged in the interstices of parts, that they would, at first, appear to be the common connecting membrane, as about the breast, axilla, &c. The bones, which receive air are of two kinds; some, as the sternum, ribs, and vertebrae, have their internal substance divided into innumerable cells; whilst others, as the os humeri and the os femoris, are hollowed out into one large canal. These bones may be distinguished from those that do not receive air, by their less specific gravity; by being less vascular, and consequently whiter, than others; by containing little or no oil; by having no marrow nor bloody pulpy substance, even in their cells; by not being, in general, so hard and firm as other bones; and by the ease with which the passage that conveys the air into the bones may be perceived. The mechanism by which the lungs are adapted for communicating air to the above-mentioned parts consists principally in the attachment of the lungs to the diaphragm and their connection with the ribs and sides of the vertebrae. These adhesions are peculiar to this tribe of animals. For the communication of the air from the lungs to the other parts, the diaphragm is perforated with large holes, which open a free passage between the cells of the lungs and the abdomen: to each of these perforations is an-

nexed a distinct membranous bag, which is very thin and transparent, and these bags, which receive the air, are extended over the whole abdomen. The lungs open at their anterior part, or towards the sternum, into membranous cells, which lie open upon the sides of the pericardium, and communicate with the cells of the sternum. The superior part of the lungs opens into large cells of a loose net work, through which the trachea, oesophagus, and large vessels, in their way from and to the heart pass. When these cells are distended with air, the size of the part where they lie is enlarged, and this distension indicates passion, as appears in the turkey-cock, pouting pigeon, &c., and in the breast of a goose, when it cackles. These cells communicate with others in the axilla, under the large pectoral muscle, &c.; and those again with the cavity of the os humeri by small openings in the hollow surface, near the head of that bone. The posterior edges of the lungs, which lie on the sides of the spine, and project backwards between the ribs, open into the cells of the bodies of the vertebrae, ribs, canal of the medulla spinalis, sacrum, and other bones of the pelvis; and thus the air finds a passage to the cavity of the thigh-bone. This supply of the bones with air is not wholly by means of the lungs; for the cells of the bones of the head, in some birds, are filled with it, as in the case of the owl, which has the diploe between the two plates of the scull cellular, and capable of admitting a considerable quantity of air from the Eustachian tube.

Hunter finally conjectures that these air-bladders are to be considered as appendages to the lungs; and that they answer the same purpose with the two bags that form the lungs of amphibious animals, which are continued down through the belly, the upper part of which performs the office of respiration, and the remainder of which is a reservoir of air. In consequence of this conformation, these animals can breathe less frequently than others; and birds are thus aided in their flight, which must render frequency of respiration difficult, and a reservoir of air singularly useful. He farther suggests that this construction of the respiratory organs may assist birds in singing; and that the long continuance of the song of a canary-bird between its breathings may be owing to this cause. See *Philos. Trans.* vol. lxiv. p. 205. Dr. Latham, Linnaean Transactions, vol. iv. p. 94, queries, whether this construction may not enable some birds to dive and stay for a considerable time under water. According to Dr. Monro, these air vesicles are of considerable use in two respects. They serve, by distending the lungs with air, to render the bodies of birds specifically light, and also to straiten the trachea arteria, and thus return the air; and moreover to supply the place of a muscular diaphragm and strong abdominal muscles, and thus to aid the exclusion of the eggs and faeces.

AIR-CANE, an air-gun adapted to the shape and dimensions, and commonly carried about as a walking-stick,—see the following article. It is the same in principle as the air-gun, the only difference being, that the syringe is applied to the extremity of the barrel, and the lock

and trigger shut up in a brass case, and the trigger pulled, or the discharge made by pulling the chain. In this form of the machine, there is a round chamber for the condensed air; and it has a valve acting in a similar manner to that of the copper ball.

The AIR-GUN is a pneumatic instrument for the projection of bullets by the condensation of air. The ancients were certainly acquainted with the principles of its construction, as well as the general properties of air. Aristotle speaks of all the elements having weight, with the exception of fire; and Plutarch and Stroboe represent him as having taught, that the weight of air was between that of fire and earth. The last philosopher also quotes Empedocles, as attributing the action of respiration to the pressure of air, by which it insinuates itself into the lungs. Hero, of Alexandria, in his work, *Spiritalia*, applies the principle of the elasticity of the air to explain various phenomena, and in such a way as sufficiently to prove that he was no stranger to its common properties. Ctesibus adopting the principle of elasticity, as is well known, constructed 'wind-guns,' between which, and the modern air-gun, there was only this difference, that in the former the ball was not immediately exposed to the action of the air, but was impelled by the longer arm of a lever, while the air acted on the shorter; but the principle of operation is the same in both, and shows clearly that the elastic property of common air, if it could not be accurately measured, was at least well known at that time. The first modern account of an air-gun which we meet with, is in the *Elementa d'Artillerie* of David Rivaut, who was preceptor to Louis XIII. He ascribes the invention to Marin, of Lisieux, who presented one to Henry IV. of France.

The elasticity of gunpowder has been estimated as equal to about 1000 times that of common air: admitting, therefore, this to be correct, (although there seems to be great reason to suppose it to be under-rated) it would be necessary that air should be condensed 1000 times more than in its natural state, to produce the same effect as gunpowder. There is, however, this important consideration to be attended to, viz. that the velocities with which equal balls are impelled, are directly proportional to the square roots of the forces; so that if the air in an air-gun be condensed only ten times, the velocity with which it will project a ball will be one-tenth of that arising from gunpowder; and if the air were condensed twenty times, it would communicate a velocity of one-seventh of that of gunpowder, and so on.

But air-guns project their balls with a much greater proportion of velocity than that stated above, for this reason, that as the reservoir, or magazine of condensed air, is commonly very large in proportion to the narrow tube which contains the ball, its density is very little altered by expanding through that tube, and, consequently, the ball is urged all the way by nearly the same uniform force as at the first instant; whereas the elastic fluid arising from inflamed gunpowder, is but very small in proportion to the tube or barrel of the gun, occupying, indeed,

but a very small portion of it next the butt-end and, therefore, by dilating into a comparatively large space as it urges the ball along the barrel, its elastic force is proportionally weakened, and it acts always less and less on the ball in the tube. Whence it happens that air condensed into a pretty large machine only ten times, will project its ball with a velocity but little inferior to that given by gunpowder; and if the valve of communication be suddenly shut again by a spring, after opening it to let some air escape, then the same charge may serve to impel several balls in succession. In all cases where a considerable force is required, and, consequently, a great condensation of air, it will be requisite to have the condensing syringe of a small bore, perhaps not more than half an inch in diameter; otherwise the force requisite to produce the compression will become so great, that the operator cannot work the machine; for, as the pressure against every square inch is about 15 lbs., and against every circular area of an inch diameter, 12 lbs.; if the syringe be an inch in diameter, it will require a force of as many times 12 lbs. as the density of the air in the receiver exceeds that of the common atmosphere; so that when the condensation is ten times, the force required will be 120 lbs.; whereas, with a half-inch bore, it will only amount to 30 lbs.

The common air-gun is made of brass, and has two barrels; the inside barrel A, plate II. fig. 10, which is of a small bore, from whence the bullets are exploded; and a large barrel, E C D R, on the outside of it. There is a syringe, S M P, fixed in the stock of the gun, by which the air is injected into the cavity between the two barrels through the valve E P. The ball K is put down into its place in the small barrel, with the rammer, as in any other gun. At S L is another valve, which, being opened by the trigger O, permits the air to come behind the bullet so as to drive it forwards. If this valve be opened and shut suddenly, one charge of condensed air may be sufficient for several discharges of bullets; but if the whole air be discharged on one single bullet it will drive it out with a greater force. This discharge is effected by means of a lock, fig. 13, placed as in other guns; for the trigger being pulled, the cock will go down and drive the lever O, fig. 10, which will open the valve, and let in the air upon the bullet K.

An improvement of this air-gun has been made by Dr. Ellis, in which the chamber containing the condensed air is not in the stock, but in five or six hollow copper balls, about three inches in diameter. These are fitted to a screw on the lock of the gun, and are so furnished with valves as to retain at pleasure the air forced into their cavities, whereby they may be carried about from place to place, ready charged with condensed air, and the gun itself is rendered as light and portable as the smallest fowling-piece.

The best construction, of modern times, has, however, been suggested by the late Mr. B. Martin, and is represented fig. II. A is the barrel with the lock, stock, ram-rod, &c. of the size and weight of a common fowling-piece. Under the lock at b, is a round steel tube, having a small moveable pin in the inside, which is pushed out when the

trigger *a* is pulled, by the spring work within the lock; to this tube, a hollow copper ball *c*, screws perfectly air-tight. This copper ball is fully charged with condensed air by the syringe, *B* fig. 9, previous to its being applied to the tube *b* of fig. 11. It is then evident that if a bullet be rammed down in the barrel, the copper ball screwed fast at *b*, and the trigger *a* be pulled, that the pin in *b* will, by the action of the spring work within the lock, forcibly strike out into the copper ball, and thereby in pushing suddenly a valve within the copper ball, let out a portion of the condensed air; which air will rush up through the aperture of the lock, and forcibly act against the bullet, driving it to the distance of sixty or seventy yards, or further. If the air is strongly condensed, at every discharge only a portion of the air escapes from the ball; therefore, by re-cocking the piece, another discharge may be made; and thus repeated to the amount of fifteen or sixteen times. An additional barrel is sometimes made, and applied for the discharge of shot, instead of the one above described. The air in the copper ball is condensed by means of the syringe, *B*, fig. 9, in the following manner. The ball *c* is screwed quite close on the top of the syringe. At the end of the steel-pointed rod *a*, is a stout ring through which passes the rod *k*: upon this rod the feet should be firmly set; then the hands are to be applied to the two handles *i i*, fixed on the side of the barrel of the syringe. Now by moving the barrel *B* steadily up and down on the rod *a*, the ball *c* will become charged with condensed air; and it may be easily known when the ball is as full as possible, by the irresistible action that the air makes against the piston when you are working the syringe. At the end of the rod *k* is usually a four-square hole, which, with the rod, serves as a key to fasten the ball *c* fast on the screw *b* of the gun and syringe, close to the orifice in the ball *c*. In the middle is fixed a valve and spring which gives way for the admission of air; but upon its emission comes close up to the orifice, shutting up the internal air. The piston rod works air-tight by a collar of leather on it, in the barrel *B*; it is therefore plain, when the barrel is drawn up, the air will push in at the hole *k*. When the barrel is pushed down, the air therein contained will have no other way to pass from the pressure of the piston but into the ball *c* at top. The barrel being drawn up, the operation is repeated, until the condensation is so strong as to resist the action of the piston. Sometimes the syringe is applied to the end of the barrel *C*, see fig. 12, the lock and trigger shut up in a brass case *d*; and the trigger pulled, or discharge made, by pulling the chain *b*. In this contrivance there is a round chamber for the condensed air at the end of the syringe at *e*, and it has a valve acting in a similar manner to that of the copper ball. When this instrument is not in use, the brass case *d* is made to slide off, and the instrument then becomes a walking stick; from which circumstance, and the barrel being made of cane, brass, &c. it has received the appellation of air-cane. The head of the cane unscrews and takes off at *a*, where the extremity of the piston rod in the barrel is shown: an iron rod is placed in a ring at the end of this,

and the air condensed in the barrel in a similar manner to that of the gun as above; but its force of action is not near so strong and permanent as that of the latter.

M. I. Colbe's magazine air-gun is also an improvement of the common air-gun. By his contrivance ten bullets are so lodged in a cavity; near the place of discharge, that they may be drawn into the shooting barrel, and successively shot so quickly, as to be nearly of the same use with so many different guns; the only motion required, when the air has been previously injected, being that of shutting and opening the hammer, and cocking and pulling the trigger. In fig. 18 is exhibited a section of the gun, as large in every part as the gun itself; and so much of its length is shown as is necessary to give a complete idea of the stock; *G* Fig. 14 is the end of the injecting syringe, with its valve *H*; opening into the cavity, *F F* 16 between the barrels. *KK* is the small or shooting barrel, which receives the bullets, one at a time from the magazine, *E D*, which is a serpentine cavity, fig. 15, wherein the bullets, *b b*, &c. are lodged, and closed at the end, *D*. The circular part, *S I s k M i*, is the key of a cock, having a cylindrical hole, *I K*, through it, equal to the bore of the small barrel, and forming a part of it in the present situation. When the lock is taken off, the several parts, *Q R T S W*, &c. come into view, by means of which the discharge is made by putting up the pin, *P p*, which raises and opens a valve, *V*, to let in the air against the bullets, *I*, from the cavity, *F F F*; which valve is immediately shut down again by means of a long spring of brass, *N N*. This valve *V*, being a conical piece of brass, ground very true on the part which receives it, will of itself be sufficient to confine the air. To make a discharge, pull the trigger, *Z Z*, which throws up the seer, *y x*, and disengages it from the notch, *x*; upon which the strong spring, *W W*, moves the tumbler, *T*, 17, to which the cock is fixed. The end, *u*, of this tumbler bears down the end, *v*, of the tumbling lever, *R*, which, by its other end, *m*, raises the flat end, *l*, of the horizontal lever, *Q*, by which means the pin, *P p*, is pushed up, and opening the valve, *V*, discharges the bullet; all which is evident from a bare view of the figure.

To bring another bullet instantly to succeed *I*, there is a part, *H*, called the hammer, represented in fig. 19, and fig. 20, which by a square hole goes upon the square end of the key of the cock, and turns it about, so as to place the cylindric bore of the key *l k*, in any situation required.

Thus, when the bullet is in the gun, the bore of the key coincides with that of the barrel *KK*; but when it is discharged, the hammer, *H*, is instantly brought down to shut the pan of the gun; by which motion the bore of the key is turned into the situation *i k*, so as to coincide with the orifice of the magazine; and upon lifting the gun upright, the ball next the key tumbles into its cavity, and falling behind two springs, *s s*, fig. 18, is by them detained. Then lifting the hammer again, the ball is brought into its proper place, near the discharging valve, and the bore of the key again coincides with that of the shooting-barrel. It appears how expeditious a

method this is of charging and discharging a gun; and if the force of condensed air was as great as that of gunpowder, such an air gun would actually answer the end of many guns, and prove the best defence against highwaymen or robbers; because, when there is reason to suspect them, they might then make five or six discharges before the robber could come within pistol-shot. See PNEUMATICS.

AIR-JACKET, a sort of jacket made of leather, in which are several bags, or bladders, composed of the same materials, communicating with each other. It is designed for the use of bathers and young swimmers. The bags or bladders are filled with air through a leather tube having a brass stop-cock accurately ground at the extremity, by which means the air blown in through the tube is confined to the bladders. The jacket must be wet before the air be blown into the bladders, as otherwise, it will immediately escape through the pores of the leather. By the help of these bladders, which are placed near the breast, the person is supported in the water.

The AIR-LAMP is formed by a combination of inflammable air and electricity: and although depending upon principles different from the foregoing instruments, is generally classed with pneumatic machines. The construction of it is as follows:

A, fig. 57, is a glass jar, containing inflammable air, B an open glass urn holding water, by the pressure of which, the air is forced out of the jar A, through the brass pipe *a*; C is the stop-cock, so perforated that the water may descend from B into A, and the air pass out through the pipe *a*. By turning the bar of the stop-cock into a horizontal position, the communication between the two vessels is cut off, and the passage of the air obstructed; but by placing it in a vertical position, the communication is again opened. The lower jar A is supplied with inflammable air by means of the bladder, fig. 58, and two bladders of this kind are attached to each lamp. The method of using the machine is as follows: Take off the cover D from the lamp, and turn the stop-cock upwards, then pour as much clean water into it as will fill the vessel A up to the pipe *a*, unscrew this pipe, and put in its place the small brass piece W, and to this screw one of the stop-cocks and bladder, fig. 58.

With the bladder under one arm, and with one hand applied to the cock at C, while the other is directed to the bladder, press the latter, and at the same time open the apertures; by which means, the air will be forced upon the water in A, and driven up the glass pipe through the tube into B. When the vessel A is thus charged with air, the stop-cocks are to be turned, so as to cut off the communication with the external air; and care must be taken that the common atmospheric air does not mix with the inflammable; for, if this takes place, the explosion would be great, and might be attended with unpleasant circumstances.

For lighting the lamp the electric fluid is employed, the apparatus being as follows: The wooden base E F, fig. 59, is a sort of box, about twelve inches square, and five inches deep; and in this is placed an electrophorus, consisting of a

resinous cake *c*, and metallic plate *d*, which, by a hinge at its back, admits of being pulled upwards and downwards by the silken string *b*, connected both with it and with the stop-cock C. When this cake is once excited, its electric effect upon the metallic plate will be continued a long time. A metallic chain G, communicates with a wire and ball, passing through a brass tube below, in the box over the plate; and above, with a fine wire passing through a glass tube. This upper wire is bent to about one-eighth of an inch distance from the flame-pipe. It is evident that when the electrophorus in the box is previously excited, and the stop-cock C turned, the silken string *b* will raise the metallic plate; and this will give an electric spark to the ball and wire above, which will convey it instantly to the flame-pipe, and inflame the air issuing out of the pipe, in consequence of the pressure of the water in its descent into the vessel A. The cock C being turned back, the flame ceases; and turned again, appears; and will serve to light a candle, match, &c. whenever it may be thought proper.

The number of times in which light may be produced will be very great, depending on the quantity of inflammable air in the vessel A. If the cock be not turned back, the flame will continue till the whole of the inflammable air is consumed. The light thus produced will be sufficient for reading a large print in the night, or seeing the hour by a watch. When the electrophorus is to be excited, the silken string *b* is unhooked from the plate, and the apparatus taken out of the box; and the metallic plate is lifted up, whilst with a silken string, or dry cat-skin rubber, you may briskly rub the surface of the resinous cake. About 20 revolutions in rubbing will be sufficient, so that the plate will give a spark to the knuckle about the distance of an inch; and by the strength of the spark the degree of excitation is to be estimated. The silken string and small glass tubes, through which the wire G passes, should always be very dry, that the passage of the electrical spark may be quite perfect. The whole length of this apparatus is about 22 inches; but it may be made of any dimensions. Dr. Ingenuous used a small apparatus, constructed upon a similar principle, in obtaining light for domestic purposes, both when at home and on his travels. Adams's Lectures, by Jones, vol. ii. p. 99, &c.

AIR-PIPES, are an invention for drawing foul air out of ships, or any other close places, by means of fire, and were first suggested by Mr. Sutton, a brewer in London; from him they received the name of Sutton's air-pipes. The principle on which their operation depends, is this simple one, that air is necessary for the support of fire; and, if it have not access from the places most adjacent, it will not fail to come from those that are more remote. Thus, in a common furnace, the air enters through the ash-hole; but if this be closed up, and a hole made in the side of a furnace, the air will rush in with great violence; if a tube of any length whatever is inserted, the air will rush through the tube into the fire, and of consequence there will be a continued circulation of air in that

place where the extremity of the tube is laid. Mr. Sutton's contrivance, as communicated to the Royal Society by Dr. Mead, is thus described:—‘As, in every ship of any bulk, there is already provided a copper or boiling-place, proportionable to the size of the vessel; it is proposed to clear the bad air, by means of the fire already used under the said coppers or boiling-places for the necessary uses of the ship. It is well known, that, under every such copper or boiler, there are placed two holes, separated by a grate; the first of which is for the fire, and the other for the ashes falling from the same; and that there is also a flue from the fire-place upward, by which the smoke of the fire is discharged at some convenient place of the ship. It is also well known, that the fire once lighted in these fire-places, is only preserved by the constant draught of air through the forementioned two holes and flue; and that if the said two holes are closely stopped up, the fire, though burning ever so briskly before, is immediately put out. But if, after shutting up the above-mentioned holes, another hole be opened, communicating with any other room or airy place, and with the fire, it is clear, the said fire must again be raised and burn as before, there being a like draught of air through the same as there was before the stopping up of the first holes; this case differing only from the former in this, that the air feeding the fire, will now be supplied from another place. It is therefore proposed, that, in order to clear the holds of ships of the bad air therein contained, the two holes above-mentioned, the fire-place and ash-place, be both closed up with substantial and tight iron-doors; and that a copper or leaden pipe, of sufficient size, be laid from the hold into the ash place, for the draught of air to come in that way to feed the fire. And thus it seems plain, from what has been already said, that there will be, from the hold, a constant discharge of the air therein contained; and consequently, that the air, so discharged, must be as constantly supplied by fresh air down the hatches or such other communications as are opened into the hold; whereby the same must be continually freshened, and its air rendered more wholesome and fit for respiration. And if into this principal pipe so laid into the hold, other pipes are let in, communicating respectively, either with the well or lower decks, it must follow, that part of the air, consumed in feeding the fire, must be respectively drawn out of all such places to which the communication shall be so made.’ It is evident, that, by means of pipes of this kind, a constant circulation of fresh air would be occasioned through those places where it would otherwise be most apt to stagnate and putrefy. Several other contrivances have been used for the same purpose; and Doctor Hale's ventilators have, by some, been reckoned superior in efficacy, and even simplicity, to Mr. Sutton's machine.

A machine capable of answering the same purpose was invented by Mr. Desaguliers, which he called the ship's lungs. It consisted of a cylindrical box set up on its edge, and fixed to a wooden pedestal. From the upper edge of the box issued a square trunk open at

the end, and communicating with the cavity of the box. Within this box was placed a cylindrical wheel turning on an axis. It was divided into thirteen parts, by means of partitions placed like the radii of a circle. These partitions did not extend quite to the centre, but left an open space of about eighteen inches diameter in the middle: towards the circumference, they extended as far as possible without interfering with the case, so that the wheel might always be allowed to turn freely. It is plain, that if the wheel were now turned towards that side of the box on which the trunk was, every division would push the air before it, and drive it out through the trunk, at the same time that fresh air would come in through the open space at the centre, to supply that which was thrown out through the trunk. By turning the wheel swiftly, a strong blast of air would be continually forced out through the square trunk, on the same principles on which a common fanner winnows corn. If the wheel is turned the opposite way, a draught of air may be produced from the trunk to the centre. If this machine, then, is placed in a room where a circulation of air is wanted, and the trunk made to pass through one of the walls; by turning the wheel swiftly round, the air will be forced with great velocity out of that room, at the same time that fresh air will enter, through any chinks by which it can have access, to supply that which has been forced out. It is evident, that the circulation which is promoted by this machine, is entirely of the same kind with that produced by Mr. Sutton's; the turning of the wheel in Mr. Desagulier's machine being equivalent to the rarefaction of the air by fire in Mr. Sutton's; but that the latter is vastly superior, as acting of itself, and without intermission. Mr. Sutton's machine has yet another conveniency, of which no other contrivance for the same purpose can boast; namely, that it not only draws out putrid air, but destroys it by causing it to pass through fire; and experience has abundantly shown, that though putrid air is thrown into a great quantity of fresh air, it is so far from losing its pernicious properties, that it often produces noxious diseases. We do not say, indeed, that putrid air becomes salutary by this means; but it is undoubtedly rendered less noxious than before; though, whether it is equally innocent with the smoke of fire fed in the common way, we cannot pretend to determine. Besides this machine by Mr. Desagulier, and the ventilators of Dr. Hale, already mentioned, those called wind-sails, are likewise used for the same purpose. The former of which is an improvement of the Hessian bellows, see VENTILATOR; the other is a contrivance for throwing fresh air into those places where putrid air is apt to lodge; but this has the last mentioned inconvenience in a much greater degree than any of the others, as the blast of fresh air throws out that which was rendered putrid by stagnation, in such a manner as to contaminate all around it. See WIND-SAILS.

AIR-PUMP, in PNEUMATICS. The discovery of this pneumatic instrument was perhaps the most important event connected with the history of that science. It is ascribed to Otto de Gue-

ricke, the consul of Magdeburg, who exhibited his first public experiments with it before the emperor and the states of Germany, at the breaking up of the Imperial diet, at Ratisbon, in the year 1654; and his description of the instrument, and of the experiments performed upon it, were first published in his *Experimenta nova Magdeburgia de Vacuo Spatio*, in the year 1672; but like many other important inventions and discoveries, its true origin has been warmly contested. Dr. Hook and M. Duhamel ascribe the invention of the air-pump to Mr. Boyle; but that ingenious philosopher frankly confesses, that 'De Guericke was before-hand with him.' In a letter which Boyle wrote to his nephew, Lord Dungarvon, at Paris, about two years after Schottus's book was published, he introduces the acknowledgment of his obligation for the discovery of this useful machine, to what he had heard of it, though he had not perused it, by that well-applied passage of Pliny, 'benignum est et plenum ingenui pudoris fateri per quos profecerris.' Some attempts, he assures us, he had made upon the same foundation, before he knew any thing of what had been done abroad; but the information he afterwards received from Schottus's *Mechanica Hydraulico Pneumatica*, published in 1657, wherein was given an account of De Guericke's experiments, first enabled him to bring his own instrument to maturity. Hence, with some assistance from Dr. Hook, arose a new air-pump, more simple and manageable than the German original, but this noble instrument has since received various modifications and improvements. We shall now, therefore, give a sketch of De Guericke's pump, and the one first constructed by Mr. Boyle, that contrasting them with the modern instruments, the progress of this important invention may be clearly traced. De Guericke's machine is exhibited in plate I. fig. 1, AIR PUMP. It consists of an iron three-legged frame *a b c d f*, supporting a round iron plate *b c*, in the middle of which is inserted a brass syringe *g h*. The upper part of this syringe is furnished with a rim of lead *y*, fig 1-a, and it is fastened below by means of an iron ring *k*, and three iron arms, *o o o*, to the legs of the frame. Within the rim *y* there is a brass plate, *m n* fig. 1-b, encompassed by a ring of leather, and fixed by three screws, which terminate upwards in a small tube *n*, into which the pipe connected with the vessel to be exhausted is inserted as occasion requires. To this, on the lower side, is adapted a valve of leather, through which the air passes into the syringe. In this plate there is also another small valve at *z*, opening upwards, through which it escapes; the plate being covered by a copper vessel, *x x*, intended for containing water. The piston of the syringe *s h*, fig. 1, and fig. 1-c, is connected by a joint at *t*, with the iron rod *t u*, which is fastened to the handle *w u u*, and this moves round the pin at *w*, by which it is connected with one of the legs of the frame. In order to prevent the air from entering into the syringe, a copper vessel of water is suspended by hooks to the arms *o o o*, so that the lower part of the syringe at *k k*, and the piston, may be always covered with water when the machine is at work.

The receiver *L* is a glass sphere, adapted to a brass cap *p p*, which has a pipe with a stop-cock *q r*, and this pipe is fitted to the tube *n* above-mentioned. From this brief description of the machine, its operation may be easily understood. When the piston *s h* is depressed, the air will be expanded in the syringe *g h*, and that of the receiver, will descend into it through the valve in the lower surface of the plate *m n*; but when the piston is elevated, and the air is compressed, this valve, shutting upwards, will close the passage to the receiver, and make it escape through the valve *z*, which opens upwards. In order to render the exhaustion more complete, a small exhausting syringe is adapted to the plate, which is represented at *m*.

Considering that at this time the elastic property of the air was but little known, this machine has not perhaps more defects than were to be expected in a first attempt; but amongst others, the labour of working it was very considerable, and its operation very slow; moreover, being worked under water, the number of experiments that might be performed upon it was very limited.

Mr. Boyle's air-pump is represented in the same plate fig. 2. It consisted of a spherical receiver *A*, with a hole at the top, whose diameter *B C* was about four inches; this was covered with a plate, having a brass rim *D E*, which was firmly cemented to the ring of glass that surrounded the hole, and to the tapering orifice of the brass rim was adapted a brass stopple *F G*, ground so exactly as to prevent, as much as possible, the admission of air. In the centre of the cover was a hole, of about half an inch diameter, provided with a socket; to which the brass stopple *K* was so fitted as to prevent the entrance of the air; the lower part of this stopple was perforated with a hole, and through this passed a string for the convenience of moving to and fro the subjects of experiments. To the neck of the receiver a stop-cock *N* was fastened, and to the shank of the cock *X*, a tin plate, *M T U W*, was so cemented as to prevent the admission of air. The lower part of the machine consisted of a wooden frame with three legs, *a a a*, and a transverse board *b b b*, on which the pump rested. The cylinder of the pump was cast brass, and it was fitted with a sucker, of which one part was covered with shoe leather, so as exactly to fill the cavity of the cylinder; and to this was fastened the other part, which was a thick narrow plate of iron *e e*, somewhat longer than the cylinder, indented on one edge with narrow teeth, so as to admit the corresponding teeth of a small iron nut, fastened by two staples to the under side of the transverse board *b b b*. On this the cylinder rested, and was turned to and fro by means of the handle *f*. The last part of this cylinder is the valve *R*, consisting of a hole bored through at the top of the cylinder, somewhat tapering towards the cavity, into which a ground peg of brass is fitted, to be taken out or put in at pleasure. In order to prevent more effectually the admission of air, and to prepare the sucker of the pump for motion, a quantity of oil was poured in at the top of the receiver, and also into the cylinder. The

operator having fixed the lower shank of the stop-cock into the upper orifice of the cylinder, turns the handle, and thus forces the sucker to the top of it, so that no air may be left in its upper part. Then shutting the valve with the plug, and turning the handle the other way, he draws down the sucker to the bottom of the cylinder, and thus its cavity, into which no air is admitted, will be in an exhausted state. By turning the stop-cock, and opening a passage between the cylinder and the reservoir, the air contained in the one will descend into the other; and this air being prevented from returning, by turning back the key of the stop-cock, will be made to open the valve, and to escape into the external air, by forcing the sucker to the top of the cylinder; thus, alternately moving the sucker upwards and downwards, turning the key, and stopping the valve, as occasion requires, the exhaustion may be carried on to any extent.—

We now pass to

AIR-PUMP, BOYLE'S, AS IMPROVED BY HAWKES-BEE.—The description of this machine as given by Desaguliers, in vol. ii. of his Exper. Philos. is as follows: It consists of two brass barrels *aa*, *aa*, fig. 22, twelve inches high and two wide. The pistons are raised and depressed by turning the winch *b b*. This is fastened to an axis passing through a strong-toothed wheel, which lays hold of the teeth of the racks *c c c c*, the one being raised, while the other is depressed; by which means the valves, which are made of limber bladder, fixed in the upper part of each piston, as well as in the openings into the bottom of the barrels, perform their office of discharging the air from the barrels, and admitting into them the air from the receiver to be afterwards discharged; and when the receiver becomes pretty well exhausted of its air, the pressure of the atmosphere in the descending piston is nearly so great, that the power required to raise the other is little more than is necessary for overcoming the friction of the piston; this renders the pump preferable to all others, which require more force to work them as the rarefaction of the air in the receiver advances. The barrels are set in a brass dish about two inches deep, filled with water or oil to prevent the insinuation of air. The barrels are screwed tight down by the nuts *e e*, and thus force the frontispiece *f f* down on them, through which the two pillars, *g g*, *g g*, pass.

From between the barrels rises a slender brass pipe *h h*, communicating with each by a perforation in the transverse piece of brass on which they stand. The upper end of this pipe communicates with another perforated piece of brass, which screws on underneath the plate *i i i i*, of ten inches diameter, and surrounded with a brass rim to prevent the shedding of water used in some experiments. This piece of brass has three branches: first, an horizontal one communicating with the conduit-pipe *h h*. Second, an upright one screwed into the middle of the pump-plate, and terminating in a small pipe *k*, rising about an inch above it. Third, a perpendicular one, pointing downwards in the continuation of the pipe *k*, and having a hollow screw in its end receiving the brass cap of the gage-pipe *l l l l*, which is of glass, thirty-four inches long, and

VOL. I.

immersed in a glass cistern, *m m*, filled with mercury. This is covered on the top with a cork float, carrying the weight of a light wooden scale divided into inches, which are numbered from the surface of the mercury in the cistern; and the scale will therefore rise and fall with the mercury in the cistern, and indicate the true elevation of that in the tube.

There is a stop-cock immediately above the insertion of the gauge-pipe, by which its communication may be cut off; and another at *n*, by which a communication is opened with the external air, for allowing its re-admission; there is sometimes also another, immediately within the insertion of the conduit-pipe, for cutting off the communication between the receiver and the pump. This is particularly useful when the rarefaction is to be continued long, as there are by these means fewer chances of the insinuation of air by the many joints. The receivers are made tight by simply setting them on the pump-plate with a piece of wet or oiled leather between; and the receivers, which are open at the top, have a brass cover set on them in the same manner. In these covers there are perforations and contrivances for various purposes. The one in the figure has a slip wire passing through a collar of oiled leather, having a hook or a screw in its lower end for hanging any thing on, or for producing a variety of motions. Sometimes the receivers are set on another plate, which has a pipe screwed into its middle, furnished with a stop-cock and a screw, fitting the middle pipe *k*. When the rarefaction has been made in it the cock is shut, and then the whole may be unscrewed from the pump, and removed to any convenient place. This is called a *transporter-plate*.

It only remains to explain the gage *l l l l*. In the ordinary state of the air its elasticity balances the pressure of the incumbent atmosphere. We find this from the force that is necessary to press it into less bulk in opposition to this elasticity. Therefore the elasticity of the air increases with the vicinity of its particles; consequently it is reasonable to expect, that when we allow it to occupy more room, and its particles are further asunder, its elasticity will be diminished, though not annihilated; that is, it will no longer balance the whole pressure of the atmosphere, though it may still balance part of it. If, therefore, an upright pipe have its lower end immersed in a vessel of mercury, and communicate by its upper end with a vessel containing rarefied, and therefore less elastic, air, we should expect that the pressure of the air will prevail, force the mercury into the tube, and cause it to rise to such a height that the weight of the mercury, added to the elasticity of the rarefied air, acting on its upper surface, shall be exactly equal to the whole pressure of the atmosphere. The height of the mercury is the measure of that part of the whole pressure which is not balanced by the elasticity of the rarefied air, and its deficiency from the height of the mercury in the Torricellian tube, is, in like manner, the exact measure of this remaining elasticity. It is evident, therefore, that the pipe will be a scale of the elasticity of the remaining air, and will indicate the degree of rarefaction; for there must be some analogy be-

tween the density of the air and its elasticity, and we have seen, (except in extreme cases of condensation and rarefaction) that they increase and diminish together and according to the same law. This gage must be considered as one of the most important improvements introduced into this machine by Hawkesbee; at the same time it must be acknowledged to have certain imperfections and inconveniences attending it, which are obviated in other contrivances of a like kind.

It will be immediately perceived, that air-pumps merely serve to rarefy the air to a greater or less degree, and that none of them can produce a complete exhaustion. But, independent of this theoretical impossibility, there are mechanical defects which prevent us from carrying on the exhaustion according to the law laid down in theory; few pumps will bring the mercury, in such a gage as that above described, to within one-tenth of an inch; and that of Hawkesbee's, fitted up according to his own instructions, will seldom bring it within one-fifth. Pumps with cocks of the best construction, and under the most favourable circumstances, will bring it within one-fortieth; but this degree of rarefaction has never been attained, when valves fitted up with wet leather were employed: in such cases, one-fifth of an inch is the least that the gage falls short of the Torricellian column. Pumps with stop-cocks, when well made and newly put together, are generally found to rarefy the air to a greater degree than those which are made with valves; but after being used for some time they become less accurate than those with valves. The valves, however, are also imperfect, because the external air, pressing upon that in the piston, prevents its rising when the elastic force of air in the receiver under exhaustion is much diminished; and attempts have therefore been made, particularly by the Abbé Nollet and Gravesande, to perfect the construction of cocks.

In the latter author's double-barrelled-pump, the cocks at the bottom of the pistons are turned by an apparatus that is moved by the handle of the pump. The piston has no valve, and the rod is connected with it by a stirrup, as in a common pump. This rod has a cylindrical part, which passes through the stirrup and moves stiffly in it, through the space of about half an inch, between a shoulder above and a nut below. The stirrup supports a round plate, which has a short square tube that fits tight into the hole of a piece of cork, and which has also a square shank that goes into the square tube. Between the plate and the cock is put a piece of thin leather, soaked in oil, and another is placed between the cork and the plate, which forms the sole of the stirrup. When the winch is turned to raise the piston from the bottom of the barrel, the friction of the piston against it keeps it in its place, and the rod is drawn up through the stirrup. The wheel has thus liberty to turn about an inch, and this is sufficient to turn the cock, so as to cut off the communication with the external air, and to open that with the receiver. When this is done, the continued motion serves to raise up the piston to the top of the barrel. When the

winch is turned in the opposite direction, the piston remains fixed till the cock is turned, so as to shut the communication with the receiver and open that with the external air. The cock has one perforation diametrically through it, and another in a perpendicular direction to this, and after reaching the centre, it passes along the axis of the cock, and communicates with the external air. By means of this communication, when it is opened, the air rushes in and balances the pressure on the upper side of the piston in this barrel, so that the pressure on the other must be counteracted by the person who works the pump. In order to obviate this inconvenience, Gravesande put a valve on the orifice of the cock, by tying over it a slip of wet bladder, or oiled leather; and by means of this the piston is pressed down as long as the air in the barrel is rarer than the outward air, just as if the valve were in the piston itself. This is all that is necessary to be described in Gravesande's pump; its performance is highly extolled by him, as far exceeding his former pumps with valves; and the same preference was given to it by his successor Muschenbroeck. Hawkesbee's pump, however, maintained its pre-eminence in this country, and, indeed, pretty generally on the continent, except in France, till about the year 1750, when Smeaton, so celebrated for his mechanical skill, undertook to improve and perfect the cock-pumps, which, however, he at length, after various attempts, gave up, finding it absolutely impossible to bring them to that degree of accuracy he had in view; and he then turned his attention to the valve-pumps; and the great advantages, gained by his construction, have been thus explained:

His first object was to diminish the resistance to the entry of the air from the receiver into the barrels, which he rendered almost nothing, by enlarging the surface on which this feebly elastic air was to press. Instead of making these valves to open by the pressure of the air on a circle of one-twentieth of an inch in diameter, he made the valve hole an inch in diameter, thus enlarging the surface 400 times; and to prevent this piece of thin leather from being burst by the great pressure upon it, when the piston in its descent was approaching the bottom of the barrel, he supported it by a delicate but strong grating, dividing the valve-hole like the section of a honey-comb; and that the points of contact between the bladder and grating might be as few as possible, the holes were made hexagonal, and the partitions filled almost to an edge. The breadths of these hexagons are three-tenths of an inch, and, consequently, the surface nine times larger than common; and, as the circumference is three times greater than that of the common valve, and the cohesion to be overcome is, in the first moment of the air exerting its force, proportional to the circumference of the hole, the valve over any of these holes will be raised with three times more ease. Beside, the raising of the valve over the centre hole is aided on all sides by those that are placed round it; and, as they all contribute as much to raise the bladder over the centre hole, as the air acting immediately under it, the valve will be raised with

much more facility than we have already supposed, that is, with about one-sixth of the force commonly necessary. The other defect in the common constitution would still hinder the rarefaction from being carried on beyond a certain degree; for, as the piston does not fit so closely to the bottom of the barrel as totally to exclude the air, this air, as the piston rises, will expand itself, and, pressing upon the valves in proportion to its density, prevent the air within the receiver from coming out. Therefore, if a vacancy, for example, equal to 150th part of the capacity of the whole barrel had place, no air could pass out of the receiver when expanded 150 times, though the piston were constantly drawn to the top; because the air in the receiver would be in equilibrio with that in the barrel when in its highest state of rarefaction. In order to obviate this inconvenience, Mr. Smeaton shut up the top of the barrel with a plate, having in the middle a collar of leather, through which the cylinder works that carries the piston; by which means the external air is prevented from pressing on the piston; but, for the discharge of the air that passes from below through the valve of the latter, there is another valve applied to the plate at top, which opens upwards. By this construction, when the piston is put down to the bottom of the cylinder, the air under it will evacuate itself so much the more, as the valve of the piston opens more easily when pressed by the rarefied air above it, than when pressed by the whole weight of the atmosphere; and, as the piston may be made to fit as nearly to the top of the cylinder as it can to the bottom, the air may be rarefied as much above the piston as it could before have been in the receiver; whence it follows, that the air may now be rarefied in the receiver, in the duplicate proportion to what it could be upon the common principle. By this means a pump, consisting of a common barrel, may be worked with more ease than the common pump with two barrels, because the pressure of the outward air is taken off by the upper plate; and when a considerable degree of rarefaction is required, it will produce it more speedily.

This gentleman's air-pump, as constructed by Nairne, may be described as follows: Upon a solid base or table are set up three pillars F, II, II, fig. 23; the pillar F supports the pump-plate A; and the pillars II, II, support the front or head, containing a brass cog-wheel, which is turned by the handle B, and works in the rack C fastened to the upper end of the piston-rod. The whole is still farther steadied by two pieces of brass, c b and o k, which connect the pump-plate with the front, and have perforations communicating between the hole a in the middle of the plate and the barrel. DE is the barrel of the pump, firmly fixed to the table by screws through its upper flanch; e f d c is a slender brass tube screwed to the bottom of the barrel, and to the under hole of the horizontal canal c b. In this canal there is a cock which opens a communication between the barrel and the receiver, when the key is in the position represented in the figure; but when the key is at right angles with this position, this communication is cut off. If that

side of the key which is here drawn next to the pump-plate be turned outwards, the external air is admitted into the receiver; but if turned inwards the air is admitted into the barrel. g h is another slender brass pipe, leading from the discharging valve at g to the horizontal canal h k, to the under side of which it is screwed fast. In this horizontal canal there is a cock n which opens a passage from the barrel to the receiver when the key is in the position here drawn; from the barrel to the external air when the key is turned outwards, and from the receiver to the external air when the key is turned inwards. This communication with the external air is not immediate, but through a sort of box i; the use of which is to receive the oil discharged through the top valve g. In order to keep the pump tight, and in working order, it is proper sometimes to pour a table-spoonful of olive oil into the hole a of the pump-plate, and then to work the pump. The oil goes along the conduit b c d f e, gets into the barrel and through the piston-valve, when the piston is pressed to the bottom of the barrel, and is then drawn up, and forced through the discharging valve g, along the pipe g h, the horizontal passage h n, and finally into the box i. This box has a small hole in its side, near the top, through which the air escapes. From the upper side of the canal c b there arises a slender pipe, which bends outward and then turns downwards, and is joined to a small box, which cannot be seen in this view. From the bottom of this box proceeds downwards the gage-pipe of glass, which enters the cistern of mercury G fixed below. On the upper side of the other canal at o is seen a small stud, having a short pipe of glass projecting horizontally from it, close by, and parallel to, the front piece of the pump, and reaching to the other canal. This pipe is closed at the further end, and has a small drop of mercury or oil in it at the end o. This serves as a gage in condensing, indicating the degree of condensation by the place of the drop; for this drop is forced along the pipe, and condenses the air before it in the same degree that it is condensed in the barrel and receiver. In constructing this pump, Mr. Smeaton introduced a method of joining together the different pipes and other pieces, which has great advantages over the usual manner of screwing them together with leather between, and which is now much used in hydraulic and pneumatic engines. The piece h i p in fig. 24, is the same with the little cylinder observable on the upper side of the horizontal canal c d, in fig. 23. The upper part h i is formed into an outside screw, to fit the hollow screw of the piece d e e d. The top of this last piece has a hole in its middle, giving an easy passage to the bent tube c b a, so as to slip along it with freedom. To the end c of this bent tube is soldered a piece of brass c f g, perforated in continuation of the tube, and having its end ground flat on the top of the piece h i p, and also covered with a slip of thin leather strained across, and pierced with a hole in the middle. It is plain, from this form, that if the surface f g be applied to the top of h i, and the cover d e e d be screwed down on it, it will draw or press them together, so that no air can escape by the joint,

and this without turning the whole tube *c b a* round, as is necessary in the usual way. The conduit-pipe, *E e f c*, fig. 23, is fastened to the bottom of the barrel, and the discharging pipe *g h* to its top, in the same manner.

In describing Hawkesbee's, or Desagulier's air-pump, we mentioned the gage employed by that author for estimating the degree of rarefaction produced by the operation of the machine; we have also stated that it was subject to some inconveniences, and particularly on account of its length, which rendered its application very inconvenient. In order to remove this inconvenience, a short barometer-gage was next introduced. This was, in fact, only the bottom part of a common barometer, about eight or nine inches in length, filled with mercury, and immersed with its aperture into a small quantity of mercury contained in a glass vessel, which forms the cistern. This may either be placed under the receiver, upon the principal flat of the pump, or under a small receiver, upon a small auxiliary plate, which is annexed to some air-pumps for this purpose. As this gage is not equal to a whole barometer, it will not show the first stages of the rarefaction; but its indications will commence when about three-fourths of the air have been removed from the receiver; that is, when the air has been rarefied till its remaining elasticity is not able to support that short column of mercury. The siphon-gage, which is shown in the figure of Smeaton's air-pump, differs from the short barometer-gage merely in this circumstance, that, instead of terminating in a cistern, the tube is here bent and rises upwards with its aperture, which, by means of a brass tube, is made to communicate with the inside of the pump, so that the ascending leg of the tube performs the office of a cistern.—Hence, in rarefying the air, the mercury descends from the closed end of the tube, and rises into the ascending leg; and, consequently, the altitude of it in one leg, above its altitude in the other, shows the degree of rarefaction; and this altitude, as in the long and short barometer-gages, is shown by an annexed scale of inches and parts. The gages above mentioned evidently indicate the elasticity of the fluid, which remains in the receiver of the pump after a certain degree of rarefaction; and it is immaterial whether that elastic fluid be air or vapour. Mr. Smeaton invented another instrument of this kind, which, from its form, is called a pear-gage; this shows (not at the actual time, but after the re-admission of the air into the receiver) how much of that fluid had been left in the receiver in the preceding rarefaction. This gage is also shown in the figure of Smeaton's pump above described. It consists of a glass vessel, which has a small projecting orifice, and at the other end it is extended into a tube closed at the upper extremity; the capacity of which is 100th part of that of the whole vessel. The instrument is suspended with its aperture downwards to the lower end of a slip of wire, or a wire which passes through a collar of leather, within the glass receiver of the pump, and exactly under it, a small cup, containing quicksilver, is placed upon the plate of the pump. When the machine has been worked to the intended degree, the air in the pear-gage

is evidently rarefied as much as it is in the receiver; and in that state, by lowering the slip of wire, the pear-gage is let down till its aperture has reached the bottom of the mercury. This done, the external air is admitted into the receiver; which cannot, as is obvious, enter the pear-gage, on account of the aperture being immersed in the quicksilver; but the pressure of the atmosphere, now acting on the surface of the mercury, forces that fluid into the gage, and fills it up to a certain degree, for instance to *r*; then the upper part of the gage will contain all the air or vapour which occupied the whole cavity of it during the rarefaction. To the upper part of the gage is annexed a divided scale, which shows what part of the capacity of the whole gage is filled with air, and of course measures the degree to which the rarefaction of the air had been carried.

Mr. Smeaton on making use of this gage, was much surprised to find that it did not give always the same results as the common gages above described. When the receiver contains no other fluid besides air, the pear-gage and the other gages will indicate the same degree of rarefaction; but if the receiver contain the vapour of water or of other liquor, then the pear-gage will indicate a much greater degree of rarefaction, than the siphon or short barometer-gage; because the vapour, which has elasticity sufficient to supply the place of air in the receiver, on the re-admission of air, is condensed into a much smaller space than the same quantity of rarefied air could be, so that the pear-gage shows the quantity of air alone which had been left in the receiver, whereas the other gages show the quantity of elastic fluid which is actually remaining in it. This cause, however, of the difference in these two kinds of gages was not in the least suspected at first; but some experiments upon it being repeated before the honourable Mr. Cavendish, the latter accurate philosopher immediately accounted for the difference which the two gages indicated on the principles above stated, by referring to some experiments of his father, lord Charles Cavendish; from which it appeared, that water, whenever the pressure of the atmosphere on it is diminished to a certain degree, is immediately turned into vapour, and reduced as suddenly to water again on restoring the pressure. The degree of pressure varies according to the temperature of the water; for when the heat is 72° of Fahrenheit's scale, it is converted into vapour as soon as the pressure is reduced to three-quarters of an inch of quicksilver, or about one-fortieth of the usual pressure of the atmosphere; but when the heat is only 41° of Fahrenheit's scale, the pressure must be reduced to that of a quarter of an inch of quicksilver, or to a one hundred and twentieth part of the usual pressure, before the water turns into vapour. According to this hypothesis, whenever the air in the receiver is exhausted to the above-mentioned degree, the moisture adhering to the different parts of the machine will be converted into an elastic vapour, and supply the place of the air which is drawn away by the working of the pump, and the fluid left in the receiver and pear-gage will be chiefly this vapour. When the air is let into the receiver again, the vapour

within the pear-gage will be reduced to water, and only the real air will remain uncondensed; consequently, this gage shows only how much real air is left in the receiver, and not how much the pressure or spring of the included air is diminished; whereas either of the other gages shows how much the included elastic fluid is diminished, and that equally, whether it consist of air or vapour.

In order to ascertain the truth of this theory, Mr. Nairne proceeded to free every part of his apparatus as much as possible from any adhering moisture, concluding that, by these means, he should be able to bring the two gages to an agreement. Instead, therefore, of placing the receiver on leather as before, he put it on the pump-plate, made as clean and dry as possible, and applied a cement round its edge to exclude the outward air. When the pump, in this state, was worked for ten minutes, the barometer-gage indicated a degree of exhaustion nearly equal to 600; and on letting the air into the receiver, the pear-gage showed also an exhaustion but little exceeding the former. In another experiment he put a piece of the oiled leather above-mentioned into the receiver, and found, on working the pump, that the barometer-gage indicated a degree of exhaustion of nearly 300, while, on the re-admission of the air, the pear-gage gave an exhaustion of little less than 400, and thus confirmed the hypothesis advanced by Mr. Cavendish. He performed, likewise, numerous other experiments relating to this subject, which may be seen in vol. lxvii Phil. Trans.

There still remained one imperfection which Mr. Smeaton had not attempted to remove. The discharging-valve was opened against the pressure of the atmosphere; and although the ingenious contrivances of this celebrated mechanist had greatly diminished, it had not annihilated, the obstructions to the passage of the air from the receiver into the barrel. His success, however, encouraged other attempts, but they are too numerous for us to enter upon in detail in this article; we shall, therefore, pass over some of minor importance, and proceed at once to describe that of Mr. Prince, a native of America, who conceived the idea of dispensing with the valves entirely. In order to effect this, he removed the lower valve, and opened the bottom of the barrel into a cistern on which it was placed, and which had a free communication with the receiver; for the valve on the upper plate on the top of the barrel, constructed like Mr. Smeaton's, made it unnecessary, that there should be any at the bottom, in order to rarefy the air in the receiver. The cistern was made deep enough to admit the piston descending into it below the bottom of the barrel. If the piston be solid, that is, without a valve, when it enters the barrel and rises to the top plate, which is made air-tight with a collar of leather, like Smeaton's, it forces out all the air above it; and, as the air cannot return into the barrel on account of the valve in the top plate, when the piston descends there will be a vacuum between it and the plate, every thing being supposed perfect. But, in working the pump, the piston is not

allowed to descend entirely into the cistern, so far as to leave the barrel open; it descends only below a hole in the side of the barrel near the bottom, which opens a free communication between the barrel, cistern, and receiver. Through this hole the air rushes from the cistern into the exhausted barrel, when the piston has dropped below it; and by the next ascent, this air is forced out as the other was before. If the capacity of the receiver, cistern, pipes, &c. below the bottom of the barrel, taken together, be equal to the capacity of the barrel, half the remaining air will be expelled at every stroke. But in order to save the labour that would attend the working of this pump with a solid piston, the constructor pierced it with three holes, at equal distances from each other, and by a circular piece of bladder tied over the top of the piston, formed a sort of valve over the holes, which opened with sufficient ease to save any labour in working the pump, by allowing the air to pass through the piston in its descent. The escape of the air, however, does not depend upon a passage through the piston into the barrel; for when the air, weakened by rarefaction, cannot open this valve, it will still get into the barrel when the communication is opened with the hole at the bottom. This piston will, therefore, descend as easily as any other, nor will the rarefaction be in any respect impeded by the valves. By this construction the valves, made to open with more ease by Mr. Smeaton, are rendered useless for rarefying the air, and that at the bottom of the barrel is entirely removed; the valve on the top plate being the only one necessary in the rarefaction.

The next object of this mechanist was to expel the air more perfectly out of the barrel than was effected in the machine last described, by making a more complete vacuum between the piston and the top plate, so that more of the air might be allowed to expand itself into the barrel from the receiver. Mr. Prince also contrived to connect the valves on the top plate with the receiver, occasionally, by means of a pipe and cock, by the turning of which the machine might be made to exhaust or condense at pleasure. It still remained to remove the pressure of the atmosphere from the valve on the top plate, so that this might open as easily as the piston-valve; with which view he connected with the duct on the bottom piece, which conveys the air from the valves to the cock, a small pump of the same construction as the large one, having the barrel opening into the cistern; the piston-rod, which is solid, moving through a collar of leathers, and a valve at the top, through which the air is forced into the atmosphere. This is called the valve-pump; its principal use being to rarefy the air above the valves, or to remove the weight of the atmosphere from them. When this valve-pump is used, the passage through the cock is shut up; and, therefore, instead of placing three ducts at equal distances round the cock, after the manner of Mr. Smeaton, the whole is divided into five equal parts, leaving the distance of one-fifth part between the ducts leading from the cistern and the valves to the cock, and two

fifths between each of these and the one leading from the cock to the receiver; therefore, when the communication is open between the receiver and the valves for condensation, the other hole through the cock opens the cistern to the atmosphere; but when the communication is made between the cistern and the receiver, for exhaustion, a solid part of the key comes against the duct leading to the valve, shuts it up, and the air which is forced out of the barrel passes through the atmosphere into the valve-pump. One advantage in this construction is, that the pump with two barrels may be made like the common pump, which cannot be conveniently done where the lower valve is retained. In this pump the pistons do not move the whole length of the barrel, a horizontal section being made in them a little more than half way from the bottom, where the top plates are inserted; on which account it is more convenient and simple, as the head of it is brought down from the top of the barrels, in the same manner as in the common air-pump. The barrels also stand upon the receiver-plate, which is raised high enough to admit the long barometer-gage, of thirty-two or thirty-three inches, to stand under it, without inconvenience in working the pump; as the winch moves through a smaller portion of an arc at each stroke, than it would do if the piston moved through the whole length of the barrels.

A gage is placed between the barrels when the condensation is to be measured, having a free communication with the valves, cock, &c. This is likewise so constructed that it will serve to measure the rarefaction above the valves, when the air is worked off by the valve-pump; and consists of a pedestal, the die of which is made of glass (which forms a cistern for the mercury), a hollow brass pillar, and a glass tube hermetically sealed at one end, which moves up and down in the pillar through a collar of leathers. When the pump is used as a condenser, the degree of condensation is shown by a scale marked on one edge of the pillar, and when as an exhaust, the rarefaction is marked on the other edge. This gage will also show when the valves have done playing, either with the weight of the atmosphere on them, or taken off. For the purposes of great condensation, the inventor has fitted a condenser of a smaller bore than the great pump, to the cistern of a valve-pump, to be screwed on occasionally. Or even without this condenser, the valve pump may be adapted to the purpose, by being made a little larger, and by having a plate made to screw into the bottom of the cylinder, with a valve on it opening into the cistern; a hole must be made to open on the same occasion near the top of the cylinder, to let air in below the piston, when this is drawn up above it. The common gage, which is generally placed under the receiver-plate, is here situated in the front of the pump, so that it may be seen by the person working the machine; and, that the plate itself may be left free for other uses, the plate is also so fixed to the pipe leading to the cock, that it may be taken off at pleasure, and used as a transerrer, or for other purposes.

The head is made whole, except a small piece on the back, where the wheel is let in; the latter being freed from the piston-rods by pushing it into the back part of the head, where it is kept in its place by a button, screwed into the socket in the axis behind. The piston-rods are thus dislodged from the wheel, and let down into the cistern when the pump is not in use, in which cistern they may have the advantage of being covered with oil; the same may also be done with all the principal joints which are sunk into the sockets, that the leathers which close them may be covered with oil, to prevent their leaking after a long disuse. A perspective view of Prince's air-pump, as constructed by Mr Jones, is shown in fig. 25; which will render the above account more intelligible.

CUTHBERTSON'S AIR-PUMP. The last improvement in the construction of air-pumps which it will be necessary for us to mention, is that by Mr. Cuthbertson, a machine so excellent in its structure, and so powerful in its effects, as to claim particular notice and description.

A perspective view of it is given in fig. 26, with its two principal gages screwed into their places, which need not, however, be used together, except in cases where the utmost exactness is required. In common experiments one of them is removed, and a stop-cock put in its place. When the pear-gage is used, a small, round plate, on which the receiver may stand, must be first screwed into the hole at A; but this hole is stopped on other occasions by a screw. When all the three gages are used, and the receiver is exhausted, the stop-screw B, at the bottom of the pump, must be unscrewed, to admit the air into the receiver; but when they are not all used, any of the stop-screws will answer the purpose. Fig. 27 represents a cross-bar for preventing the barrel from being shaken, either by working the pump, or by accident; its place in fig. 26 is represented by the dotted lines; where it is confined and kept down close to the barrels by two slips of wood, NN, which must be drawn out, as well as the screws OO, when the pump is taken asunder. The figures 28, 29, &c. exhibit a section of all the working parts of the pump, except the wheel and rack, in which there is nothing uncommon. Fig. 28 is a section of one of the barrels, with all its internal parts; and figs. 29, 30, 31, and 32, are different parts of the piston, proportioned to the size of the barrel. In fig. 28, CD represents the barrel, F the collar of leathers, G a hollow cylindrical vessel to contain oil, It is also an oil-vessel to receive the oil which is drawn along with the air through the hole aa, when the piston is drawn upwards; and when this is full, the oil is carried over with the air, along the tube T, into the oil vessel G; cc is a wire, which is driven upwards from the hole aa by the passage of the air; and as soon as this has escaped, it falls down again by its own weight, shuts up the hole, and prevents all return of air again into the barrel. At dd are fixed two pieces of brass to keep the wire cc in a vertical position, in order that it may accurately shut the hole; and H is a cylindrical wire or rod, which carries the piston I, being made hollow to receive a long wire

gg, which opens and shuts the hole *L*. On the other end of the wire *O*, is screwed a nut, which, by stopping in the narrowest part of the hole, prevents the wire from being driven up too far; these are seen more distinctly in figs. 29 and 33; they slide in a collar of leather *rr*, fig. 29 and 32, in the middle piece of the piston. Figs. 31 and 32 are the two mean parts which compose the piston, and when the pieces, figs. 30 and 33, are added to it, the whole is represented by fig. 29; and fig. 32 is a piece of brass of conical form, having a shoulder at bottom, in which is cut a long hollow screw, about two-thirds of its length, and the remaining part of the hole, in which there is no screw, is of about the same diameter as the screwed part, except a thin plate at the end, which is of a width exactly equal to the thickness of *gg*.

That part of the inside of the conical brass in which no screw is cut, is filled with oiled leathers, having holes, through which *gg* can slide stiffly. An external screw, with a hole in it, is also fitted to *gg*, and serves to compress the leathers *rr*. In fig. 31, *aaaa* is the outside of the piston, the inside of which is turned so as exactly to fit the outside of fig. 32; *bb* are round leathers about sixty in number; and *cc* is a circular piece of brass of the size of the leathers, while *dd* represent the screw serving to compress them. The screw at the end of fig. 30 is made to fit the screw fig. 32, and if fig. 33 be pushed into fig. 32, this into fig. 31, and fig. 30 be screwed into the end of fig. 32, these will compose the whole piston, as shown in fig. 28. In fig. 28 and 29, *H* represents the same part, being that to which the rack is fixed; if, therefore, this be drawn upwards, it will cause fig. 32 to shut close into fig. 31, and drive out the air above it; and on the contrary when it is pushed downwards, it will open as far as the shoulder *aa* will permit, and suffer the air to pass through: *AA*, fig. 34, is the receiver-plate, *BB* is a long square piece of brass, screwed into the under side of the plate, through which a hole is drilled, corresponding to that in the centre of the receiver-plates, and with three internal screws, *b*, *b*, *c*.

Let us now endeavour to explain the process of rarefaction, which is carried on as follows. Conceive the piston to be at the bottom of the barrel, the inside of which, from *a*, fig. 28, contains common air. Now when the rod is drawn up, the upper part of the piston sticks fast in the barrel, till the conical part connected with the rod shuts the conical hole, and its shoulder applies close to its bottom. The piston being now shut, the whole is drawn up by the rack-work, driving the air before it through the hole *ac* into the oil-vessel at *R*, and out into the atmosphere by the tube *T*. The piston will then be at the top of the barrel at *a*, and the wire *gg* will stand nearly as shown in the figure, just raised from the hole *L*, where it is prevented from rising higher by the nut *O*. During this motion the air will expand in the receiver, and come along the bent tube *m*, into the barrel. By this means the barrel will be again filled with air, which, as the piston rises, will be rarefied in the proportion of the capacity of the receiver, pipes, and

barrel together, to that of the latter alone. When the piston is moved down again by the rack-work, it will force the conical part, fig. 32, out of the hollow part, fig. 31, as far as the shoulders *aa*; fig. 29 will rest on *aa* fig. 31, which will then be so far open as to permit the air to pass freely through it, while at the same time the end of *gg* is forced against the top of the hole, and by shutting prevents any air from returning into the receiver; thus the piston moving downwards, suffers the air to pass out between the sides of figs. 31 and 32; and when it is at the bottom of the barrel, it will have the column of air above it, and, consequently, when drawn up it will shut, and drive out this air, and, by opening the hole at *L*, will, at the same time, give a free passage to more air from the receiver. This process being continued, the air of the receiver will be rarefied as far as its expansive power will permit; for, in this machine, there are no valves to be forced open by the elasticity of the air in the receiver, which at last it is unable to effect; there is, therefore, nothing to prevent the air from expanding to its utmost degree, which is the peculiar excellency of this construction.

When this machine is used for condensation, at the same time that it rarefies, or separately, the piece containing the bent tube *T* must be removed, and fig. 35 put in its place, and fixed by its screws. This figure, as drawn in the plate, is intended for a double-barrelled pump; but for a single-barrel, only one piece is used, represented by *baa*, the double piece being cut off at the dotted line *aa*. In this piece is an internal screw, to receive the end of a long brass tube, to which a bladder (if sufficient for the experiment of condensation), or a glass, properly secured for this purpose, must be screwed: then the air, which is abstracted from the receiver on the pump-plate, will be forced into the bladder, or glass; but, if the pump be double, the apparatus fig. 35, is used, and the long brass tube screwed on at *c*. Figs. 36 and 37 represent two gages, the former of which is screwed into *cb*, or into the screw at the other end of *c*; fig. 34, and fig. 37 into the screw *ab*, fig. 34. When the machine is used as a single pump, either to rarefy or condense, the screw *K* which fastens the rack to the piston rod *H*, must be taken out; then turning the winch till *H* is depressed as low as possible, the machine will be fitted to exhaust as a single pump, and if it be required to condense, the directions above given must be observed with regard to the tube *T* and fig. 35.

Mr. Cuthbertson, by a variety of experiments with this air-pump, has shown its great power of exhaustion with the double siphon-gage, as also with the long gage, compared with an attached barometer, in which the mercury had been repeatedly boiled; and the difference between the heights of the mercurial columns was found not to exceed one-fortieth of an inch, the barometer standing at thirty inches, which gives a rarefaction of 1200. On some occasions, when the air was in a very dry state, the difference has been observed as low as an hundredth part of an inch, a rarefaction more than double the former.

See *A Description of an Improved Air-Pump*, by John Cuthbertson; and *Nicholson's Philosophical Journal*, vol. i.

The latter work, in examining the comparative merits of Prince's and Cuthbertson's air-pumps, offers the following observations :

' There is no provision to open the upper fixed valve of Prince's greater barrel, except the difference between the pressures of the elastic fluid on each side of the stripe of bladder: and this may reasonably be inferred to limit the power of his small pump. In Cuthbertson's pump, the same valve is exposed to the action of the atmosphere, together with that of a column of oil in the oil-vessel. The mischief in either instrument is probably trifling; but in both the valve might have been opened mechanically. If this were done, the small pump of Prince might, perhaps, be unnecessary in most states of the atmosphere. With regard to the lower valves, Cuthbertson, by an admirable display of talents as a workman, has insured their action; Prince, on the other hand, has, by the process of reasoning, so far improved the instrument, that no valve is wanted. In this respect he has the advantage of simplicity and cheapness with equal effect. The mechanical combination of Cuthbertson's pump, reduces the operation to one simple act of the handle; but Prince's engine requires some manipulation with regard to the play of the small pump; though this might have been remedied by a more skilful disposition of the first mover.

' The most perfect scheme for an air-pump, taking advantage of the labours of these judicious operators, seems to be that in which two pistons, of the construction of Prince, should work in one barrel, one piston being fixed at the lower end of the rod, and the other at the middle. The lower piston must come clear out of the barrel when down, and work air-tight through a diaphragm at an equal distance from the effective ends of the barrel. In the diaphragm must be a metallic valve of the form of Cuthbertson's lower valve, but with a short tail beneath, that it may be mechanically opened when the piston comes up. Above the diaphragm must work the open piston, similar to the first; but as it cannot quit the barrel when down, a small portion of the barrel must be enlarged just above the diaphragm, so that the leathers may be clear in that position. Lastly, the top of the barrel must be closed, and fitted with a valve and oil-vessel, according to the excellent contrivance of Cuthbertson.'

We shall conclude our sketch with the description of a table, or portable air-pump, which is from its size and figure, very convenient and sufficiently powerful for most common experiments.

AIR-PUMP, TABLE, OR PORTABLE.—This has two brass barrels, which are firmly retained in a perpendicular situation to the square wooden table on which they rest, by a transverse beam, which is pressed upon them by screws at the top of the two pillars. From the hole in the centre of the pump-plate there is a perforation, or canal, in a brass piece to the fore part of the frame of the pump; and from this canal there

is a perforation, at right angles to the former, passing to the centre of the base of each barrel. At each of these centres a valve is placed, opening upwards, to admit the air into the barrels; and to each barrel a piston is so fitted that the air cannot pass between it and the sides of the barrel. Both pistons have a valve opening upwards, that the air in the lower part of the barrel may escape through them into the room or atmosphere. They are also connected by a rack, and raised or depressed by a handle, the lower part of which is fixed to the axis of a cog-wheel, whose teeth lay hold of the rack. One piston is raised, and the other is depressed by the same turn of the handle, and the operation of exhaustion is the same as in the common pump first described. The two barrels are advantageous, because they perform the work more speedily, and also because the weight of the atmosphere, pressing upon the rising piston, is counterbalanced by an equal weight pressing upon the other piston descending.—Behind the large receiver on the pump plate, there is sometimes a small plate for sustaining a small receiver; and from the hole, at the centre of this plate, there is a canal communicating with that, which passes from the large receiver to the barrels. Under the receiver is a small bottle containing mercury, and a small tube filled with mercury, freed from air, inverted with the open end in the mercury; which is, in fact, the short barometer-gage described. This pump, without the gage, is shown by fig. 38.

AIR-PUMP, EXPERIMENTS WITH THE.—Having now illustrated its construction under a variety of forms, it may be interesting to many of our readers to be furnished with a few familiar deductions confirmed and established by experiments on this important apparatus.

1. One of the most interesting experiments of this kind, showing the weight and pressure of atmospheric air, is to take a large copper ball, as light as is consistent with the purpose it is intended to answer, having a small neck to it, furnished with a stop-cock; this neck is to be screwed on the receiver-plate, so that it may be exhausted of air after the same manner as the common receiver; this being done, turn the stop-cock, which will prevent any air from entering when the ball is unscrewed. Let now the weight of the ball be taken by a very accurate balance, and when this is well ascertained, turn again the stop-cock, and the air will immediately rush in, and the ball will in consequence preponderate. The weight necessary to bring the balance to an equilibrium will be equal to the weight of the air re-admitted. In this manner, the specific gravity of air has been ascertained to be .00128, that of water being 1.
2. Let a receiver be placed on the plate of the air-pump, having a hole an inch or an inch and a half in diameter at the top; cover this hole with the palm of the hand, while another person works the machine so as to produce the exhaustion; and the pressure which, after two or three strokes of the piston, will be experienced on the hand from the external atmosphere, will be such as to convince the most sceptical of the truth of the proposition. If the exhaustion be carried to any consider-

derable degree, it will be difficult to remove the hand without violence, or without re-admitting the air. 3. Place a small receiver, O fig. 39, over the hole of the pump-plate, and, upon exhausting the air, the receiver will be fixed down to the plate by the pressure on its outside; then, by turning the cock of the pump, and re-admitting the air, the receiver will become loose. In order to prove that the receiver O is held down by the pressure of the air, suspend it on the hook of the wire P P passing through the collar of leathers at the top of the receiver M, by which it is covered, and thus let it down on the plate of the pump; and when the air is exhausted from both receivers, the large receiver M will be fixed to the plate by the pressure of the external air; but the small one will be loose and easily removed; then again, in letting in the air, the lesser one will be fixed to the plate, and the other will be released. 4. The same may be otherwise shown by the glass employed in experiment 2, viz. by tying over the hole at top a piece of bladder; then, as the air is exhausted, the bladder will be pressed into the receiver in a concave hemispherical form, and by carrying the exhaustion to a sufficient extent, the bladder will at length burst with a loud report; or, instead of the bladder, a piece of common window glass may be employed, resting on a rim of leather; when it will be found that the pressure of the external air will break the glass as soon as the air is exhausted. 5. Join together the two hollow brass hemispheres A and B, fig. 40, the edges of which must be made very perfect, or otherwise they must have a circle of wet leather placed between them; screw the end D into the plate of the pump, and open the stop-cock E of the pipe C D communicating with the hemispheres; and having exhausted the air, turn the cock again so as to stop the pipe; remove the ball from the plate, and screw on at the end D the handle F H. Two strong men now, one taking hold of each handle, and pulling straight against each other, will find considerable difficulty, or will be, perhaps, wholly unable to separate the two hemispheres. The degree of strength that will be requisite depends upon the diameter of the sphere and the nature of the exhaustion. If the latter be nearly complete, and the diameter be four inches, the area of the section will be

$4^2 \times .7854 = 12.5664$ inches;
and, assuming the pressure on every square inch to be about 15lbs. we shall have

$$12.5664 \times 15 = 188\text{lbs.}$$

for the force or strength requisite to produce the separation. 6. The pressure of the air may be also shown as follows: Set a square phial of thin glass upon the pump-plate, and, to prevent accidents, cover it with a wire cage, and place both under a close receiver. The phial must be supplied at top with a small valve opening upwards, so as to be exhausted with the receiver, but which shuts and prevents the air from afterwards entering. Let the air be exhausted from the receiver and phial, and it will be found that, upon re-admitting the air into the former, the latter will be crushed into a number of small pieces. Quicksilver may also be forced into

the pores of wood, and made to pass through it by the pressure of the atmosphere. 7. Immerse the neck c d of the hollow glass ball e b, fig. 41, in the water of the vessel a a; place it on the plate of the pump, and cover it and the hole of the plate by the receiver A; exhaust this receiver, and the air will escape by its spring, from the ball e b, through the neck c d, rise in bubbles through the water, and pass off into the external air. When the water has done bubbling, turn the cock of the pump, and the air that is admitted will, by its pressure on the surface of the water, force it up in a jet into the ball e b, and nearly fill it; the small quantity of remaining air which occupied the whole ball, and which is now reduced to a small space by condensation, is all that prevents the water from filling the whole cavity of the ball. This experiment may be varied by screwing the end A of the brass pipe A B F, fig. 42, into the hole of the pump-plate, and placing it, by means of a circle of leather, upon the plate c d, a tall receiver G H, close at top, exhausting the receiver of air, and stopping the pipe by the cock e: when this is done, remove the apparatus from the pump, set its end A in a basin of water, and open the pipe by turning the cock e, when it will be found that the pressure of the air on the water will force it up through the pipe, so that it will ascend in a jet to the top of the receiver.

Again, place the tall open receiver, A B, fig. 43, on the pump-plate over the jar D, containing quicksilver; the latter being placed near the hole or pipe communicating with the barrels. Into the plate C, placed upon the upper end of this receiver, introduce the open glass tube g f, immersed at its lower extremity in the quicksilver of the jar D, and screwed by a brass top annexed to it at h, to the syringe H, which is itself screwed to the plate C. By means of the ring I, draw up the piston of the syringe, and thus exhaust the tube of its air; and the quicksilver in the basin, pressed by the undiluted air of the receiver A B, will ascend in the tube. That this ascent is owing to the pressure of the air, and not to what is vulgarly called suction, may be shown by exhausting the receiver of its air, which will cause the quicksilver to descend into the jar, and, by re-admitting the air, it will rise again in the tube, although the piston of the syringe be not moved. If the tube be thirty-two or thirty-three inches in length, the quicksilver will rise nearly as high in the tube as it stands at that time in the barometer; and if the syringe have a small hole at m, and the piston be drawn up above that hole, the air will pass through it into the syringe and tube, and the quicksilver will immediately fall down into the jar.

Once more: the jar A, fig. 44, being filled with quicksilver, and placed on the pump-plate, cover it with the receiver B, and push the open end of the glass tube d e through the collar of leather in the brass neck C, almost down to the quicksilver in the jar; then exhaust the receiver B of its air, and the tube d e, which is close to the top f, will at the same time be exhausted. When the exhaustion has been carried on to a sufficient extent, push the open end of the tube, into the quicksilver in the jar, and it will be

found, that although the tube is exhausted, the mercury will not rise in it, because there is no pressure on the surface of that in the jar; but upon admitting the air into the receiver, the quicksilver will immediately rise, and stand as high as it did, in consequence of the action of the syringe, in the preceding experiment. These latter experiments not only exhibit the weight and pressure of the atmosphere, but they also show that they are increased or diminished in proportion to the increase or decrease of the density of the air.

The elasticity of the air may be shown in the most satisfactory manner, by placing under the receiver of an air-pump a flaccid bladder, well tied and secured at its neck, so as to prevent the air within it from escaping. Exhaust the air out of the receiver, and the bladder, as the process proceeds, will continue to expand, till at length it will appear like one full-blown, and even burst if the exhaustion be carried on to a sufficient degree; but upon re-admitting the air, it will quickly return to its original flaccid state. In experiment 6, we supposed the glass ball, fig. 41, to be filled with water, with the exception of a small bubble of air; if, in this state, it be placed with its neck downwards into the empty jar *a a*, and covered with a close receiver, and the air of the latter be exhausted, the air-bubble will expand itself, and by its elastic force protrude the water out of the globe into the jar. The same may be shown by screwing the pipe A B, fig. 42, into the pump-plate, and by placing the tall receiver G H upon the plate *c d*; for now, exhausting the receiver, remove the apparatus, and screw it into the copper vessel C C, fig. 45, half filled with water: then turn the cock *e*, fig. 42, and the air confined in this vessel will, by its spring, force the water through the pipe A B, and cause it to form a jet into the exhausted receiver equal to that which was produced by the pressure of the air in the former experiment.

The little amusing experiment called the Cartesian devil, depends upon principles nearly the same as the above. The figure of a man, made of glass, or enamel, is so constructed as to have the same specific gravity as water, and will therefore remain suspended in a mass of that fluid. A bubble, similar to that in the last experiment, communicating with the water, is placed in some part of the figure, sometimes in a small globe, as shown at *m*, fig. 46. At the bottom B of the vessel is a diaphragm of bladder which can be pressed upwards by applying the finger to the extremity *e* of lever *e o*, moving about a centre *o*. The pressure applied to *e* is communicated through the water to the bubble of air which is thus compressed. The specific gravity of the figure is thereby increased, and it consequently sinks to the bottom; but by removing the pressure, the figure again rises, so that it may be made to oscillate or dance in the vessel without any visible cause. Fishes made of glass are sometimes substituted for the human shape, and when a common jar is used for the experiment, the pressure is applied to the upper surface of it at A, which is, in this case, a piece of bladder, instead of being placed at the bottom as shown in the figure. The same effects

will be produced by placing the jar under the receiver of an air-pump, and varying the pressure by rarefaction; but, in this case, the specific gravity of the figure ought a little to exceed that of the water in the jar.

Bodies cannot move about in the atmosphere without displacing it, which requires force, and therefore the resistance of the air always diminishes the velocity of moving bodies; but this diminution will be greater or less according to the density of the falling or moving mass; for which reason those bodies which we call light, fall much slower than more dense or heavy substances. To show that this is actually the case, we need only let fall a feather and a piece of metal out of our hands at the same instant, and it will be found that the metal has reached the floor while the feather is yet falling; but place them both under the receiver of an air-pump and exhaust the air, and then let them fall, and they will both be found to reach the bottom in the same time: an apparatus for performing this experiment is shown in fig. 49; the two bodies being laid together on the brass flap *d* or *e*, which may be at any time let down, by simply turning the wire *f*, which passes through a collar of leathers *g*, placed in the head of the receiver A B. Figure 50 represents another apparatus for showing the same thing. It consists of two sets of brass vanes put on separate axles, in the manner of wind-mill-sails. One set has the edges placed in the direction of their whirling motion, that is, in a plane to which the axis is perpendicular. The planes of the other set pass through the axis, and they are, therefore, trimmed so as exactly to front the air through which they move. Two springs act upon pins projecting from the axis, and their strengths or tensions are so adjusted, that when they are disengaged in a vacuum, the two sets continue in motion equally long; but if they are disengaged in air, those vanes which oppose the air by their planes will stop long before those that cut it edgewise.

In the preceding account of the air-pump we have seen that the most modern of these machines may be made use of either for the purpose of rarefaction or condensation; but in many cases the latter operation is required to be performed when no pump is at hand: and moreover, it does not always require the same delicacy of process as that of rarefaction, and more simple apparatus are, therefore, frequently employed.

Take, for example, a prismatic tube A B, fig. 51, shut at one end, and fit it with a piston, or plug C, so that no air can pass by its sides, which, in a cylindrical tube, is best done with a turned stopper, covered with oiled leather, and fitted with a long handle C D. When this is thrust down, the air, which formerly occupied the whole capacity of the tube, is condensed into less room, and the force necessary to produce any degree of condensation, may be concluded from the weight necessary for pushing down the plug to any depth; but it is obvious that the instrument in this form is not sufficiently accurate for us to deduce, from experiments upon it, any very accurate conclusions; the following is, therefore, more commonly the form of the condenser. The end of the tube, instead of

being closed as described above, is perforated with a very small hole *e f*, and being externally turned to a small cylinder, a narrow slip of bladder, or of thin leather, soaked in a mixture of oil and tallow, must be tied over the hole. Now, let us suppose that the piston is forced down to the bottom of the barrel, to which it applies close; then, when it is drawn up to the top, it leaves a void behind, and the weight of the external air presses on the slip of bladder, which, therefore, claps close to the brass, and thus performs the part of a valve, and keeps it close, so that no air can enter. But, the piston having reached the top of the barrel, a hole *F* in the side of it is just below the piston, and the air rushes through this hole and fills the barrel. Push the piston down again, it immediately passes the hole *F*, and no air escapes through it, therefore it forces open the valve at *f*, and escapes while the piston moves to the bottom.

Now, let any vessel *E*, as, for instance, a glass bottle, or brass ball, have its mouth furnished with a brass cap firmly cemented to it, having a hollow screw, which fits a solid screw *p q*, turned on the cylindric nozzle of the syringe, and this vessel may be considered as a receiver. Screw the syringe into this cap, and it is evident that the air forced out of the syringe will be accumulated in this vessel; for upon drawing up the piston, the valve *f* always shuts by the elasticity or expansive force of the air in *E*; and on pushing it down again, the valve will open as soon as the piston has got so far down that the air in the lower part of the barrel is more powerful than the air already in the vessel. Thus, at every stroke, an additional barrel-full of air will be forced into the vessel *E*; and it will be found that, after every stroke, the piston must be pushed down further before the valve will open; for, as stated above, it cannot open till the air, condensed in the barrel by the downward motion of the piston, exceeds that in the receiver; and as the latter is increased at every stroke, so also must the stroke be longer every time before the valve will be opened.

A construction somewhat different to the above is now very commonly adopted: this consists in supplying the piston itself with a valve; that is, instead of being, as above described, one solid piece, it is made of two pieces perforated. The upper part, *i k m n*, is connected with the rod or handle, and has its lower part turned down to a small cylinder, which is screwed into the lower part *k l o n*; and has a perforation *g h* going up the axis, and terminating in a hole *h* in one side of the rod, and a piece of oiled leather is stretched across the hole *g*. When the piston is drawn up, and a void left below it, the weight of the external air forces it through the hole *h g*, opens the valve *g*, and fills the barrel. Then, on pushing down the piston, the air being compressed into less space, presses on the valve *g*, shuts it, and none escaping through the piston, it is gradually condensed, as the piston descends, till it opens the valve *f*, and is added to that already accumulated in the vessel, *E*. We may thus force any quantity of air consistent with the strength of the vessel into it, and it will be ready for any experiments that we may be de-

sirous of making with it. Instead of the glass bottle, or simple hollow globe supposed above, we may use the latter furnished with a neck and stop-cock; in this case, the cock may be turned, the ball unscrewed from the syringe, and be thus in a state to be transferred and applied to any other purpose required.

The condensation thus produced may be measured by a gage fitted to the instrument as follows: a glass tube *G H*, fig. 51-*a*, of cylindrical bore, and close at the end, is screwed into the side of the cap on the mouth of the vessel *E*; a small drop of water or mercury is taken into this tube by warming it a little in the hand, which expands the contained air, so that when the open end is dipped into water, and the whole allowed to cool, the water advances a little into the tube. The tube is furnished with a scale, divided into small equal parts, numbered from its close end. Now, since this tube communicates with the vessel, it is evident that the condensation will force the water along the tube, acting like a piston on the air beyond it, and the air in the tube and vessel will always be of one density. Suppose, for example, the number at which the drop stands, before the condensation is made, to be *c*, and that it stands at *d*, when the condensation has attained the required degree; the density of the air at the remote end of the gage, and consequently in the vessel, will be $\frac{c}{d}$. It was by such means that the laws of the condensation and elasticity of common air were originally deduced.

AIR-SHAFTS, among miners, denote holes or shafts let down from the open air to meet the adits, and furnish fresh air. The damps, want, and impurity of air, which occur, when adits are wrought thirty or forty fathoms long, make it necessary to let down air shafts, in order to give the air liberty to play through the whole work, and thus discharge bad vapours, and furnish good air for respiration: the expense of which shafts, in regard of their vast depths, hardness of the rocks, drawing of water, &c. sometimes equals, nay exceeds, the ordinary charge of the whole adit. Sir Robert Murray describes a method, used in the coal mines at Liege, of working mines without air-shafts. When the miners at Mendip have sunk a groove, they will not be at the charge of an air-shaft till they come at ore; and for the supply of air have boxes of elm exactly closed of about six inches in the clear, by which they carry it down about twenty fathoms. They cut a trench at a little distance from the top of the groove, covering it with turf and rods disposed to receive the pipe, which they contrive to come in sideways to their groove, four feet from the top; which carries down the air to a great depth. When they come at ore, and need an air-shaft, they sink it four or five fathoms distant, according to the convenience of the breadth, and of the same fashion with the groove, to draw as well ore as air.—See *Phil. Trans.* No. V. and XXXIX.

AIR-THREADS, in natural history, a name given to the long filaments, so frequently seen in autumn floating about in the air. These threads are the work of spiders, especially of that species called

the long legged field spider; which, having mounted to the summit of a bush or tree, darts from its tail, several of these threads, till one is produced capable of supporting the creature in the air: on this it mounts in quest of prey, and frequently rises to a very considerable height. See ARANIA. They are long, downy, and very soft, and though they hold together when untouched, they stick to the fingers in handling, and easily break with a light touch. The general method of these creatures in spinning and weaving the webs, is to let down the thread, then draw it after them, and so dispose it as they think proper; but in the midst of their work of this sort, if they are closely observed, they will sometimes be found to desist, and turning to the contrary way of the wind, will emit a thread with great rapidity, no less than that with which a jet of water is discharged from a cock. In this manner they continue darting forth the thread, which the wind takes, and carrying it forwards, it soon becomes many yards long. Soon after this the creature will throw itself off from the web, and trusting to the air, with this long tail, will ascend swiftly, and to a great height with it. The fragments of these lines, and the spiders attached to them, though unobserved, make these air-threads; and the use nature destines them for, is evidently the wafting of the creature along in the air, and giving it an opportunity of preying on gnats, and many other insects that inhabit the air, out of the reach of these creatures by any other means. When the threads are newly spun, they are always single, and are generally seen ascending higher and higher in the air; but when they are seen coming down, they are found sometimes composed of three or four others, and either without any spider at the ends, or with two or three, or more. It is plain that this happens from the meeting of these threads one with another in the air, and their tangling together; and this incommodes the creatures, and brings them down.

As these soon entangle together, and bring one another down, it is no wonder that they are more frequent in the lower regions of the air, than those with the spiders adhering to them, which usually rise to great heights, and sustain themselves there. And hence the origin of the threads was much perplexed among the enquirers, because they were found without any mark of the animal to which they owed their existence. The business of feeding is not all the use of these threads, but the creatures evidently sport and amuse themselves by means of them, floating about in the air, and changing height and place at pleasure. When a spider has once raised itself from the earth in this manner, it does not descend always on the same thread it arose by, but draws that up at times, and winds it up into a hank with its fore-feet, and darts out another by way of support; and the new thread is made more or less long, as it is intended for a higher or lower flight.

Philos. Trans. No. I.

AIR-TRUNK, is a contrivance by Dr. Hales to prevent the stagnation of putrid effluvia in jails, and other places where a great number of people are crowded together, in a small space. It consists only of a long square trunk, open at both ends; one of which is inserted into the ceiling of

the room, the air of which is required to be kept pure; and the other extends a good way beyond the roof. Through this trunk a continued circulation is carried on: and the reason is, that the putrid effluvia, which do so much mischief when collected, being much lighter than the pure atmosphere, rise to the top of the room; and, if they there find a vent, will continually go out through it. These effluvia arise in a very considerable quantity, being calculated by the late Dr. Keil, at no less than thirty-nine ounces from one man in twenty-four hours. These trunks were first made trial of by Mr. Yeoman, over the House of Commons, where they were nine inches wide within; and over the Court of King's Bench in Westminster hall, where they were six inches wide. They are sometimes made wider, and sometimes narrower; but the wider they are, the longer they ought to be, more effectually to promote the ascent of the vapour. The reason why vapours of this kind ascend more swiftly through a long trunk than a short one, is, that the pressure of fluids is always according to their different depth, without regard to the diameter of their basis, or of the vessel which contains them; and, upon this principle, a gallon of water may be made to split a strong cask. See HYDROSTATICS.

When the column of putrid effluvia is long and narrow, the difference between the column of atmosphere pressing on the upper end of the trunk, and that which presses on the lower end, is much greater than if the column of putrid effluvia were short and wide; and consequently the ascent is much swifter. One pan of a single pair of scales, which was two inches in diameter, being held within one of these trunks over the House of Commons, the force of the ascending air made it rise so as to require four grains to restore the equilibrium, and this when there was no person in the house; but when it was full, no less than twelve grains were requisite to restore the equilibrium; which clearly shows that these trunks must be of real and very great efficacy.

AIR-VESSELS, are spiral ducts in the leaves, &c. of plants, supposed to be analogous to the lungs of animals, in supplying the different parts of a plant with air. See PLANTS.

Dr. Grew, in his enquiry into the motion and cause of the air in vegetables, enters at some length into the structure of these remarkable vessels; and shews that air enters plants in various ways, not only by the trunk, leaves, and other visible parts, but also at the root. The pores designed for the reception and expulsion of air, are so very large in the trunks of some plants, as in the thick walking cane, that they are visible to the naked eye; but with a glass, the cane seems as if it were full of large pin-holes, resembling the pores of the skin in the ends of the fingers, and ball of the hand. In the leaves of the pine, through a glass, they make an elegant appearance, standing almost exactly in rank and file throughout the length of the leaves. The chief admission of air into plants, however, is at the root: much as in animals, some part of the air may continually pass into the body and blood by the pores of the skin; but the chief

draught is at the mouth. If the chief entrance of the air were at the trunk, before it could be mixed with the sap in the root, it must descend; and so move not only contrary to its own nature, but in a contrary course to the sap: whereas by its reception at the root, and its transition from thence, it has a more natural and easy motion of ascent. The same fact is farther evident, from the fineness and smallness of the diametrical apertures in the trunk, in comparison of those in the root; which nature has plainly designed for the separation of the air from the sap, after they are born together received into them. *Grew. Anat. of Root*, chap. iii. p. 127.

Air-vessels are found in the leaves of all plants, and are even discoverable in many without the help of glasses; for upon breaking the stalk or chief fibres of a leaf, the likeness of a fine woolly substance, or rather of curious small cob-webs, may be seen to hang at both the broken ends. This is taken notice of only in some few plants, as in *scabious*, where it is more visible; but may also be seen more or less in most others, if the leaves be very tenderly broken. This wool is really a skein of air-vessels, or rather of the fibres of the air-vessels, loosed from their spiral position, and so drawn out in length. *Id. ibid. chap. iv. p. 155.*

Dr. Hales has proved that air is inspired by vegetables; and has shewn that air, in many instances, freely enters the vessels of trees, and is wrought in great abundance into their substance. But as to particular air-vessels in plants, he asks, may not the use of those spiral wreaths, that are coiled round the insides of those vessels, which are supposed to be air-vessels, and which are manifestly to be seen in several trees, and in the leaves of the vine and scabious, be designed by nature to promote the quicker ascent of air, by being in some measure conformed to its elastic contortions? For such spiral wreaths seem to be altogether useless for promoting the ascent of any liquor, as the sap, which ascends most freely through innumerable other capillary vessels, having no such spiral coils in them: not that we are to suppose the air in its elastic state actually to touch, and thereby to be determined in the course of these spirals, as any liquor would be. But as the rays of light, when they are reflected from a solid body, are found to be reflected, without actually touching the reflecting body in the point of reflection; so it is not unreasonable to suppose, that elastic air may, like light, be diverted from one course, and so be determined to another, by the solid bodies it approaches, without touching them, but rebounding like light from those solid bodies near the point of contact.

This ingenious writer has observed, that these spirals are coiled in a course opposite to those of the sun, that is, from west to east. Vide *Static. Ess. vol. i. p. 155*, and *vol. ii. p. 265*, and *266*.

Dr. Darwin in his *Phytologia*, contends that the vessels which Malpighi, Grew, and many others, have denominated bronchia, and erroneously thought to be air-vessels, and to serve the purpose of respiratory organs, are absorbent vessels, destined to imbibe the nutriment of plants, and that they are the genuine lungs of

vegetables. 'These absorbent vessels,' he says, 'which resemble the lacteals of animal bodies, are found in the roots of plants for imbibing nourishment from the moist earth, on the external surfaces of the bark and leaves, for absorbing the humidity of the atmosphere, and also in the internal surfaces of the cells and cavities of the vegetable system, where they absorb the secreted fluids, after they have performed the offices to which they are adapted. The existence of the first sort of absorbents is evinced by the growth of plants, whilst moisture is applied to their roots, and by their withering when it is withdrawn. Those of the second sort are manifested by plucking off a leaf and laying it in water, which is found not to wither so soon as if it were left exposed to the dry air. The third class of vessels of this kind will be perceived to perform its office by moistening the albumen or sap-wood, and the inner surface of the bark of a branch severed from a tree; which are thus preserved, whilst the same parts left unmoistened in the dry air are observed to wither. Besides, if vegetables be inserted in glass-tubes or narrow vessels, filled with water, the surface of the water will be seen to subside much sooner than by evaporation alone in similar circumstances.' Dr. Darwin contrived to exhibit these absorbent vessels to the eye, by dipping twigs of a fig-tree in a decoction of madder and of log-wood, which after some time, upon cutting off about an inch of the stalk near the bottom, exhibited a circ. of red points, believed by him to be the coloured ends of the absorbents, that existed in the newly formed albumen. He expresses his astonishment that any person should have conceived these vessels, that are found in the albumen, and which consist of a spiral line, to be air vessels or tubes; and farther observes, that the absorbent vessels of trees in passing down their trunks, consist of long, hollow cylinders, of a spiral form, and of such large diameters in some vegetables, e. g. in cane, as to be visible, when dry and empty, to the naked eye. Through these air will pass rapidly upward and downward; and hence Dr. Hales has been led to coincide with Grew and others in opinion, that they are air-vessels or lungs designed for respiration, and receiving atmospherical air in their natural state. But to this Dr. D. objects, that they have no communication with the horizontal air-vessels of plants, and they exist in the root, as well as in the trunk, where, not being exposed to the atmosphere, they cannot serve for the purpose of respiration. Air, however, in its combined state, or dissolved in water, may be absorbed by these vessels; and may appear when the pressure of the atmosphere is removed in the exhausted receiver, or when it is expanded by heat; as is the case in the froth observed at one end of a green stick, when the other is burning in the fire. Dr. Darwin apprehends, that the structure of those large vegetable absorbents, which have been erroneously called air-vessels, consists of a spiral line, and not of a vessel interrupted with valves; and in this respect it differs from that of animal lymphatics. According to this writer,

the proper air-vessels are horizontal vessels of large diameter, which pass through the bark of trees to the albumen. Malpighi has given a figure of them, and Duhamel mentions fine horizontal perforations through the bark of trees, which he believes to be perspiratory or excretory organs; and besides these, he takes notice of others, that are larger, standing prominent in the birch-tree, and piercing the exterior bark; which probably contain air during the living state of the tree. Dr. Darwin supposes, that the horizontal vessels first mentioned contain air, enclosed in a thin moist membrane, which may serve the purpose of oxygenating the fluid in the extremities of some fine arteries of the embryo buds, in a manner similar to that by which the air at the broad end of the egg is thought to oxygenate the fluids in the termination of the placental vessels of the embryo chick.

AIR, or AYRSHIRE, in geography, an extensive county of Scotland, stretching ninety miles in length, along the western coast, from its southern boundary near Loch Ryan, in Wigtonshire, to Kelly bridge, which separates it from Renfrewshire on the North; and extends in breadth, generally from twenty to twenty-five miles. It is bounded on the north by Renfrew, on the south by Galloway, on the east by Lanarkshire, and on the west by the Frith of Clyde. It comprehends the districts of Carrick, Coil, Kyle, and Cunningham, which are divided into forty-six parishes, and contains 526,602 Scotch acres, or 662,005 English. From Colonel Fullarton's General View of this county, drawn up for the Board of Agriculture, we learn, that within these forty years, it has rapidly improved in its cultivation, trade, and commerce, as well as in the population, industry, and opulence of its inhabitants; that in 1791, its entire population being 83,892 souls, above 780 were proprietors of land; 1592 farmers; and about 461 paupers; that the annual funds for relief of these last, were upwards of £1262 sterling, that the valued rents amounted to £191,605 Os. 7d. Scots; and the real rents to between £150,000 and £160,000 sterling; the number of horses were about 4300; of sheep about 135,000; and of black cattle upwards of 34,000. This county exhibits the form of two wings extending to the N.W. and S.W. and forming a vast bay at the mouth of the Frith of Clyde. The principal rivers in it are the Ayr, the Stencher, the Gervan, the Doon, and the Irwin. The roads are excellent, and the plantations and clumps of trees numerous and beautiful. The county abounds in coal, iron, and other minerals. For its improvements in general, it was formerly much indebted to the exertions of the late earl of Eglington and Mr. Fairly, of Fairly, nor has the spirit of improvement relaxed of late years. Its population, according to the last census, was 127,299. Vast quantities of sea-weed are thrown on shore here, from which many tons of kelp are annually made. Most of the lochs have plenty of marl, the principal of which is loch Doon. The rivers abound with salmon, and the coasts are admirably adapted for the white fishing. The county is particularly adapted for the purpose of manu-

factures, from the abundance of the fuel; and those of cotton, woollen, thread, and muslin, are carried to a very considerable extent. In the hills of Carrick, a few curious fragments of agate, porphyry, jasper, and calcareous petrifications have been found; and galena and plumbago in the parishes of Stair and New-Cumnock, together with a species of whet-stone, known by the name of Ayr-stone. This county gave birth to Sir William Wallace, who in the reign of Alexander III. after fighting gloriously for his country, was at length betrayed into the hands of the English.

AIR, or AYR, or as it is spelt in some ancient writings, ARE, a parish of Scotland, situated in the county of that name, of a quadrangular form, about three miles long from north to south, and four miles broad at its eastern extremity, though not two at its western. It contained, according to the return made to Sir John Sinclair, by Drs. Dalrymple and M'Gill, in 1791, about 4100 inhabitants. The climate is moist, notwithstanding which many of the natives live to a great age. Tradition reports, that a battle was fought in this parish, in the valley of Dalrymple, between the Scots and Picts, before the Christian era, wherein both the sovereigns, Fergus and Coilus, were slain. Here is a strong chalybeate spring, famous in scrofulous and scorbutic complaints; and the parish is distinguished as the birth place of the celebrated Johannes Scotus, and Robert Burns, the poet.

AIR, or AYR, a royal burgh of great antiquity, the county-town of Ayrshire, and the seat of a circuit court. It is seventy-five miles south-west from Edinburgh; contains 944 houses, and 7455 inhabitants within the parish. In 1202, it was made a royal burgh by king William the Lion. It is situated on the southern bank of the river Ayr, near its influx into the Frith of Clyde. In the centre of the town, which is in the shape of a crescent, stand the tol-booth and town-hall, with a spire 135 feet high. Ayr has two churches and several other places of worship. Here are also a theatre, a public academy, a library, and a reading-room, a dispensary, a work-house, and a savings-bank. It is also intended to erect a range of public buildings, including a court house, and a gaol for criminals and debtors, on an improved plan. The harbour formed by the mouth of the Ayr, is subject to the inconvenience of a shifting bar of sand; to remedy which, two reflecting light-houses have been erected. The principal manufactures are tanning, boot and shoe making, soap-boiling, also ship-building to a small extent. The exports are cotton and woollen goods, pig-iron, coals, paint, and whetstones; the imports, grains, spirits, bricks, slates, timber, and lime-stone: the principal trade is with Ireland. Besides the salmon fishery, the sand-banks on the coast abound with all kinds of white fish, and one or two companies are established here for catching and curing them. Sir William Wallace began his exploits, and Edward I. fixed a powerful garrison at this place. Oliver Cromwell converted the church into a garrisoned fortress and armoury, and gave the inhabitants 100 merks English to build another. In the Old Church the parliament met, which confirmed

Robert Bruce's title to the throne. Ayr sends a member to parliament along with Irvine, Rothsay, Inverary, and Campbeltown. Ayr is a fashionable place of resort, has well-attended races, and is sometimes the seat of the Caledonian hunt. It is governed by a provost, two bailies, a dean of guild, a treasurer, and twelve councillors. It has two weekly markets, and four annual fairs.

AIRA, in botany, *alpa*, the Greek name for lolium or darnel, has been given by Linnæus to a genus of plants, class 3, triandria; order 2, digynia, called in English aira grass, or hair grass. Its gen. characters are: CAL. glume, two flowered; valves, ovate-lanceolate; COR. bivalve; nectary two-leaved; leaflets acute; STAM. filaments capillary; anthera oblong; PIST. germ ovate; styles cetaceous; stigmas pubescent; PER. none; seeds, sub-ovate. The species mostly consist of different species of the avena, or gramaea of other writers. Fourteen have been enumerated, nine of which are natives of Great Britain.

AIRANI, or AIRANITE, in church history, an obscure sect of Arians, in the fourth century, who denied the consubstantiality of the Holy Ghost with the Father and the Son.

AIRDRIE, a market-town of Scotland, in East-Monkland parish, county of Lanark, on the great road to Edinburgh, twelve miles east of Glasgow. It is regularly built, with fine wide streets, extending nearly a mile in length. Here are distilleries, an iron foundry, a cotton manufactory, and a Burgher chapel. It has a weekly market, Fairs, second Tuesday of January, second Tuesday of February, third Thursday of May, O. S. last Tuesday of August, and first Thursday of November, O. S. population 4860.

AIRE, a town of France, formerly the chief town of Gascony Proper, now the head of a canton in the department of the Landes, &c. arrondissement of St. Sever, situated in a fertile and agreeable country, on the slope of a hill on the left bank of the Adour. It is nine leagues N. N. E. of Pau, and twenty-two S. S. E. of Bourdeaux. Population 3000, including the suburb village of Le Mas. Long. 0°. 12'. W. lat. 43°. 42'. N.

AIRE, or ARIEN, a town of France, in the county of Artois; the head of a canton in the department of the Pas de Calais, arrondissement of St. Omer. It is situated on the Lys, thirteen miles from St. Omer, with which it has communication by canal. Long. 2°. 29'. E. lat. 50°. 38'. N.

AIRLY, a parish of Scotland, in the county of Angus; containing 1070 inhabitants. It is situated partly in the vale of Strathmore, and partly on the Grampian hills. AIRLY CASTLE, the residence of the earl of Airly, is a fine modern structure, erected on the ruins of an ancient castle of the same name. The castle of Balrie is another ruin of considerable extent, in the same neighbourhood.

AIRVAUX, or AIRVAULT, a town of France, in the province of Poitou, included in the modern department of the Deux Sévres. It contains 440 houses and 2070 inhabitants; and is fourteen leagues N. E. of Niort.

AISEAU, a marquisate, with a village of the

same name, in the kingdom of the Netherlands, three miles E. S. E. of Chatelet.

AISLE, *n.* Latin, *ala*; Fr. *aile*; a wing; the walks in a church, or wings in the choir of a cathedral.

The abbey is by no means so magnificent as one would expect from its endowments. The church is one huge nef, with a double aisle to it; and at each end is a large quire. Addison.

Nor you, ye proud, impute to these the fault,
If memory o'er their tomb no trophies raise,
Where through the long drawn aisle and fretted vault,
The pealing anthem swells the note of praise.

Gray's Elegy.

AISLINGEN, formerly a free county of the empire, belonging to the bishopric of Augsburgh, now included in the kingdom of Bavaria, circle of the Upper Danube. A market town of the same name lies about four miles south of Dillingen, has a castle, a bailiwick, and 1170 inhabitants.

AISNE, or AINE, a considerable river of France, which, after a course of forty leagues, unites itself with the Oise, a little above Champaigne. It becomes navigable near Chatean-Porcien, in the department of the Ardennes; and attempts have been made to connect it with the Maese by means of canals; but as yet without success.

AISNE, a department of France, consisting of portions of the ancient Compeigne, Isle of France and Picardy. It derives its name from the above river; and is said to contain 432,239 inhabitants. It is a grain district of considerable importance.

ALSTULFUS, the last king but one of the Lombards in Italy, succeeded his brother Rachisius, A. D. 748, had divers unsuccessful wars with Pepin, king of France, and ended a short and inglorious reign, A. D. 753, by breaking his neck at a hunting match.

AJUGA, BUGLE; in botany, a genus of the gymnospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 42d order, asperifoliae. The characters are: CAL. a one-leaved short perianthium, cut half-way into five clefts, with the segments nearly equal; COR. is monopetalous and ringent; tube cylindric and bent in; the upper lip very small, erect, bifid, obtuse; the lower, large, spreading, trifid, obtuse; middle division, very large and obcordate, side ones small; STAM. subulate, erect filaments, longer than the upper lip, anthers twin; PIST. a four-parted germ, style filiform, and with respect to situation and length as in the stamina; stigmas two, slender, the lowest shorter; no pericarpium; the calyx which is converging, fosters the seeds, which are somewhat oblong. There are six species, viz. first, *A. orientalis*, or eastern bugle; second, *ajuga Geneversis*, a native of Switzerland; third, *ajuga pyramidalis*; fourth, *ajuga acrina*, or mountain bugle; fifth, *ajuga decumbens*, the Japanese bugle; sixth, *ajuga reptans*, or common bugle.

AJURU-CATINGA, in ornithology, the Guiana red-billed parrot, a variety of the *psittacus rufirostris*, the *psittaca aquarum Lupiarum insulae* of Brisson, and the Guiana green parrot of Bancroft, and of Latham; has the bill, legs,

feet and claws of a whitish-red colour, and the orbits ash-coloured. It inhabits South America; and is about the size of a thrush; the irides have two coloured circles, of which the outer one is reddish, and the inner ash-coloured.

AJURU-PARA, a species of Brasilian parrot of a small size; of a beautiful green, and with white legs, a white beak, and white skinny circles round its eyes.

AJURU PARROT, or PSITTACUS AESTIVUS, in ornithology, the ajuru-curau of Marcgrave, the aourou-couraou of Buffon, the middle-sized parrot of Willughby, and the common Amazons parrot of Latham, is of a green colour, slightly spotted with yellow; with a blue front, blood-red shoulders, and flesh-coloured orbits. It is twelve inches long, and its body about the size of a pigeon: the back has a number of tawny yellow feathers, interspersed over its green plumage. The face is yellow, with a blue forehead and white crown; the tail-quills are green with paler tips: the first, second, and third on each side are red on their inner webs near the base; the outer web of the first being blue; the shoulders are either tawny or blood-red; the primary wing-quills are black, with bluish tips, the outer webs being green, and the inner black; the first four or five of the secondaries have their outer webs red near the base; the bill is black at the tip. This inhabits Amazonia, Guiana, and Brasil; and has several varieties, to the four first of which the above description is applicable: e. g. first, the ajuru of Jainaica; this is the psittacus viridis melanorinchos of Aldrovand, the black-billed green parrot of Willughby, and the Jamaica parrot of Brown and Latham: second, the main ajuru parrot, with the lesser wing coverts red; the crown yellow, the cheeks and chin paler, the forehead blue, the under half of the five middle wing-quills, and the inner webs, at the base of four tail-quills on each side red; a variety which inhabits Guiana and Amazonia: third, Brasilian ajuru parrot, with cap blue, variegated with black, a yellow spot on the crown, and one on each side below the eyes, and a blue chin. This is the ps. Brasil. cyanocephalus of Brisson, the ajuru-curua of Marcgrave, Ray, and Willughby, and the blue-topped parrot of Latham. The primary wing-quills, according to Mr. Latham, are variegated with yellow, red, and violet-blue. It inhabits Brasil: fourth, varied ajuru parrot, with the crown, cheeks, and chin yellow, and the front blue. The crown is variegated with blue, the scrag and upper part of the back with yellow, and the bill is ash-coloured. This is the ajuru curau secundus of Marcgrave and Ray, and the West India green parrot of Edwards and Latham: fifth, Amazonian ajuru parrot, pale green, with a pale yellow front and tawny temples. This is the ps. amazonicus of Gmelin, and the Brasilian yellow-fronted parrot of Latham. It inhabits Brasil and Amazonia, and is almost twice the size of those above-mentioned: sixth, great ajuru parrot, green, with a blue forehead, the crown, cheeks, and chin, and middle of the belly yellow. It is nearly as large as the former, and inhabits Brasil: seventh, yellow-necked ajuru parrot, green,

with yellow head and neck, and red shoulders, of the size of the former, and like it, the wing-quills are marked with a red spot, and the lateral tail-quills are red at the base: eighth, counterfeit ajuru parrot, green, variegated with yellow, having a blue forehead and red shoulders. It inhabits Brasil. *Gmelin's Linn.* tom. i. p. 340. *Kerr's Linn.* p. 598. *Buffon's Birds*, &c.

AITON, (William) in biography, an eminent botanist and gardener, was born in 1731, at a small village near Hamilton, in Lanarkshire, in Scotland. Having been accustomed from his youth to the science and practice of horticulture, he came into England in 1754, and was engaged as an assistant by Mr. Philip Miller, well known as the author of the *Gardener's Dictionary*, and then superintendent of the physic-garden at Chelsea. In this situation he soon attracted notice, and in 1759 was recommended to the princess dowager of Wales, as a fit person to manage the botanical garden at Kew. In this office to which he was then appointed he continued during life; and here he laid the foundation both of his fame and fortune. As the garden at Kew was destined to be the repository of all the curious plants that could be collected from the various quarters of the globe, Mr. Aiton had the most favourable opportunity for indulging his taste, and employing his care and skill in their cultivation; and in so doing he acquired distinguished reputation amongst the lovers of this science, and the particular esteem of his royal patrons. Under his superintendence, Kew gardens became the principal scene of botanical culture in the kingdom. In 1783 Mr. Aiton was promoted to the more lucrative office of managing the pleasure and kitchen gardens at Kew, which he was allowed to retain in connection with the botanical department which he had before occupied. In 1789 he published his *Hortus Kewensis*, or Catalogue of the Plants cultivated in the Royal Botanical Garden at Kew, in three vols. 8vo. with thirteen plates; a work which had been the labour of many years, and which justly entitles him to respectful commemoration among the promoters of science. The number of species, contained in this catalogue, is between five and six thousand. A new and curious article in it relates to the first introduction of particular exotics into the English gardens. The system of arrangement is that of Linnaeus, with such improvements as the advanced state of botanical science required. To Sir Joseph Banks, Dr. Solander, and Mr. Dryander, Mr. Aiton respectfully acknowledges his obligations for assistance in compiling this celebrated work. The *Hortus Kewensis*, was much valued by the best judges, and a large impression of it found a rapid sale. Notwithstanding the temperance and activity of Mr. Aiton, he laboured under the incurable malady of a scirrhouss liver, which occasioned his death in 1793, in his sixty-second year. His eldest son, devoted to the same pursuits, and distinguished by his talents, was appointed by the king's own nomination, to all his father's employments. The private character of Mr. Aiton was highly estimable for mildness, benevolence, and every domestic

and social virtue. He was interred in the church-yard of Kew, amidst a most respectable concourse of friends. *Gen. Biog.*

AITONIA, in botany, so called from Mr. W. Aiton, his majesty's late gardener at Kew, a genus of the monadelphia octandra class and order, and of the natural order of columniferae. Its characters are: CAL. a one-leaved, erect, four-parted, short, perianthium, divided into four ovate, sharp, segments : COR. four erect, equal, broadly-ovate, concave, very obtuse petals : STAM. have filaments, joined as far as the middle, divided above into eight, awl-shaped, furrowed, standing out of the corolla, and having ovate, furrowed anthers : PIST. a germ, superior, ovate, smooth, and subangular ; style one, filiform, of the same length with the stamens ; stigma obtuse, undivided : PERICARP. an ovate, dry, membranaceous, four-cornered, one-celled, brittle berry, the corners are produced and sharp ; the seeds many, fixed to a column, globular and smooth. It varies with five-cleft, ten-stamined flowers. There is one species, viz. A. Capensis, found at the Cape by Thunberg, and introduced here in 1774 by Mr. F. Massou.

AITZEMA, (Leo) a celebrated historian of Friesland, born A. D. 1600. and author of a History of the United Provinces, in fifteen volumes quarto, and seven folio. As a large collection of authentic pieces, this work is extremely valuable. *Now. Dict. Hist.*

AIUS LOCUTIUS, i. e. a speaking voice, one of the Dii minores, to whom the Romans erected an altar. The following incident occasioned the Romans to erect an altar to this ideal Deity. M. Seditus, a plebeian, acquainted the tribunes, that, in walking the streets by night, he had heard a voice over the temple of Vesta, giving the Romans notice that the Gauls were coming against them. This intimation was, however, neglected ; but after the truth was confirmed by the event, Camillus supposed this voice to be a new deity, and erected an altar to it under the name of Aius Locutius. A more rational supposition might have been, that the goddess Vesta herself had given them the warning ; but in this absurd manner did the heathens multiply their gods and their superstitions without end. *Cicero de Divin. i. 45.*

AJUTAGE, or AJUTAGE, from *ajouter*, to adapt, in hydraulics, part of the apparatus of an artificial fountain, or jet d'eau ; being a sort of tube, fitted to the mouth, or aperture of the vessel, through which the water is to be played, and by it determined into this or that figure. It is chiefly the diversity in the ajutages, that makes the different kinds of fountains ; and hence, by having several ajutages to be supplied occasionally, one fountain comes to have the effect of many. Marriotte enquires into the best kind of ajutages, or spouts, for jets d'eau ; affirming from experiment, that an even polished round hole, in the end of the pipe, gives a higher jet than either a cylindric, or a conical ajutage. See FOUNTAIN and HYDROSTATICS, and *Phil. Trans.* 181.

AIX, a small island on the coast of France, between the isle of Oleron and the continent. It is 12 miles N. W. of Rochfort, and 12 S. S. W. of Rochelle, now included in the department of VOL. I.

Charente Inferieure. The English made a descent on it, in 1758, and demolished the fort. Long. 1°. 5' W. Lat. 46°. 45' N. Inhab. about 15,000.

AIX, a handsome and ancient city of France, in the department of the Mouths of the Rhone, the capital of the ci-devant province called Provence, and now the chief town of an arrondissement. It is about 89 miles S. by E. of Paris, 48 S. E. of Avignon, and 21 N. of Marseilles. It is a well-built city, and is said to resemble Paris more than any other town in France. Excellent wine is produced in its neighbourhood, but its principal trade is in oil, which is uncommonly fine ; and there are also some silks and other stuffs manufactured in it. Their articles of export are wine, brandy, almonds wool, silk, grain, raisins, figs, capers, plums, olives, nuts, fish, vermicelli, linen, and hardware. The city is populous, and is seated in a large plain, chiefly planted with olive trees ; and is embellished with abundance of fine fountains, and several beautiful squares. The place des precheurs is on the side of a hill ; it is about 150 yards in length and breadth ; and is surrounded with trees, and houses built with stone three stories high. The town hall is at one end of the city, and is distributed into several fine apartments. The hotel de ville is a handsome building, but hid by the houses of the narrow street in which it is placed. The cathedral church is a gothic structure, and contains several ancient monuments. The cours, in the orbitelle quarter, is a magnificent walk, above 300 yards long, formed by a triple avenue of elms, and two rows of regular and stately houses ; and ornamented in the centre by several fountains. The churches in general are handsome buildings. In one of them, was formerly a silver statue of the Virgin Mary, almost as large as life. The baths without the city, which has eight gates, were discovered in 1704, and have good buildings, raised at a vast expense, for the accommodation of those who drink the waters. As well as a college of Jesuits and other seminaries, there was here a famous university, founded in 1409 by Pope Alexander V. The College de Bourbon was intended as a superintending court over the university. Both institutions were dissolved at the revolution, and replaced by a Lycee.

Although Aix was the first Roman settlement in Gaul, it is not remarkable for Roman antiquities. The warm springs, for which it is now known and frequented, induced Sextus Calvinus to found a colony here, to which he gave the name of Aquae Sextiae, which, in correct maps of the west empire, occupies a conspicuous place on the shores of the Mediterranean. But Aix is indebted for its greatest improvements to Louis XIV. The baths are supposed to possess particular virtues in cases of debility ; and several altars have been dug up sacred to Priapus, the inscriptions on which indicate the gratitude of its ancient inhabitants to that deity. Long. 5°. 31' E. Lat. 43°. 32' N. Population about 27,000.

Aix, an ancient town of France, in the department of Mont Blanc, in the ci-devant duchy of Savoy, eleven miles north of Chamberry. It is seated on the lake Bourget, at the foot of a

mountain, between Chambery, Annecy, and Rumilly. There is here a triumphal arch of the ancient Romans, but it is almost entirely ruined. The mineral waters bring a great number of strangers to this place. It was originally called Aquæ Gratianæ, from the hot baths built there by the emperor Gratian. Long. 5°. 48' E. Lat. 45°. 40'. N. Population 1600.

AIX-LA-CHAPELLE, a large and handsome city of Germany, once included in the circle of Westphalia and duchy of Juliers, now in the grand duchy of the Lower Rhine. It is situated 17 miles N. of Limburgh, 22 N.E. of Leige, 21 from Spa, and 40 W. of Cologne. It has a castle, built upon a hill, from which may be seen sixty different towns, the ocean, and even England, in a clear day. The town is seated in the valley, and is surrounded with woods and mountains, notwithstanding which the climate is good. It was a free imperial town for ages, and all authors agree about its antiquity; it being mentioned in Cæsar's Commentaries, and the Annals of Tacitus. The Romans had colonies and fortresses in it, when they were at war with the Germans; but the mineral waters and the hot baths so increased its fame, that, in process of time, it was advanced to the privileges of a city, by the name of Aquægrani, that is, the waters of Granius. That of Aix-la-Chapelle, was given it by the French, on account of a chapel built in honour of the Virgin Mary, by Charlemagne; who, having repaired, beautified, and enlarged the city, which had been destroyed by the Huns in 451, made it the usual place of his residence. He lies interred in the church of Notre Dame, where were long kept his sword, his belt, and the four evangelists written in letters of gold, and used at the coronation of the emperors: but the emperor of Austria is said to have transferred the three principal appendages of the chapel to Vienna; i.e. the gospels, Charlemagne's sword, and the shrine above mentioned, as indispensably necessary to the future coronation of the emperors. The last crowned here was Ferdinand I. in 1531, since which time the ceremony has taken place at Frankfort on the Maine. Aix-la-Chapelle, however, retains the greater number of the privileges conferred on it by Charlemagne.

The town may be divided into the inward and outward city. The inward is about three quarters of a league in circumference; and the outward wall, in which there were eleven gates, is about a league and a half in circumference. There are rivulets which run through the town and keep it very clean, besides various public fountains, and many private ones. They have stone quarries in the neighbourhood, which furnish the inhabitants with proper materials for their magnificent buildings, of which the stadt-house, and the cathedral are the chief. There are likewise thirty parochial churches, and numerous convents; but the greater part have been suppressed. The market place is very spacious, and the houses round it stately. Aix-la-Chapelle contained, in 1807, 3080 houses, and 27,164 inhabitants. Its manufactures of broad-cloth from Spanish wool are still famous, and occupy thirty-four flourishing establishments. Here are also

copper and brass works of some celebrity. Its revenues, including, among other things, the tax or licence paid by lottery agents, may amount to 70,000 rix-dollars, or £12,000 sterling. Part of this arises from the adjacent lands, which are productive of iron and coal.

This place is famous for several councils and treaties of peace concluded in it; particularly those between France and Spain in 1668, and between Great Britain and France in 1748. In the year 1792, it was taken by the revolutionary forces of France; was retaken in 1793, and finally again seized by the French, under the command of general Jourdan, in 1794, who defeated Clairfait, near Juliers, and made the French masters of Cologne and Bona. Until the fall of Napoleon it continued to form a part of the French empire, being the capital of the department of the Roer, and head of the arrondissement. It was ceded to Prussia by the treaty of Vienna. During this period, the bishop and clergy of Aix-la-Chapelle, testified their gratitude to the ci-devant emperor, (then first consul) as the restorer of the Gallican church, by an elegant column in the area to the principal entrance of the cathedral, bearing in the inscription, *Heroi Bonaparte Reipublicæ Gallicæ Primo Consuli, Episcopus Clerusque Aquisgranum Posuerunt, and recording the triumphs of France.* The Cossacks, when here, overturned it to get at the coins which were deposited beneath; but the king of Prussia restored it, only altering some parts of the inscription dishonourable to his country.

The hot sulphureous waters, for which this place has so long been celebrated, arise from several sources, which supply baths constructed in different parts of the town. The waters near the sources are clear and pellucid; and have a strong sulphureous smell, resembling the washing of a foul gun; but they lose this smell by exposure to air. Their taste is saline, bitter, and urinous. They do not contain iron. They are also neutral near the fountain; but afterwards are manifestly and pretty strongly alkaline, insomuch that clothes are washed with them without soap. The heat of the water of the hottest spring, by Dr. Lucas's account, raises the quick-silver of Fahrenheit's thermometer to 136° by Mons. Monet's account, to 146°; and the heat of the fountain, where they commonly drink, by Dr. Lucas's account, to 112°. Dr. Simmons has given the following account of their several temperatures, as repeatedly observed by himself, with a thermometer constructed by Nairne.

The spring which supplies what is called the Emperor's Bath, the New Bath, and the Queen of Hungary's Bath, 127°.

St. Quirin's Bath, 112°.

The Rose Bath, and the Poor's Bath, both supplied by the same spring, 112°.

Charles's Bath, and St. Corneille's Bath, 112°.

The spring used for drinking is in the High Street, opposite to Charles's

Bath; the heat of it at the pump is . . . 106°.

Dr. Lucas evaporated the water of the hottest spring, the Emperor's Bath, and obtained 268 grains of solid matter from a gallon, composed of fifteen grains of calcareous earth, ten grains of

selenites, and 243 grains of a saline matter made up of natron and sea salt. They are at first nauseous and harsh, but by habit become familiar and agreeable. At first drinking, also, they generally affect the head. A chemical analysis of this water discovers its gaseous contents to be a small portion of carbonic acid, and much sulphurated hydrogen gas, highly supersaturated, and of great volatility and pungency. The sulphur is sublimed, in a cistern, in a solid form, adhering to the upper stone, in the form of a fine powder; which is gathered, as it accumulates from time to time, and sold in the shops as Aix sulphur. That which is still retained in the water, becomes volatilized by evaporation; for when the water is exhausted by boiling, no particles remain in the residuum. A quantity of uncombined soda, is among the most important articles of its solid contents. There is also a minute portion of common salt and carbonated lime; but it does not appear that there are any purely metallic properties belonging to these waters. According to Bergman's analysis, an English pint, wine measure, is found to contain four grains and three quarters of carbonated lime, five grains of common salt, and twelve of carbonated soda. The quantity to be drank, as an alterative, is to be varied according to the constitution and other circumstances of the patient. In general, it is best to begin with a quarter or half a pint in the morning, and increase the dose afterwards to pints, as may be found convenient. The water is best drank at the fountain. When it is required to purge, it should be drank in large and often repeated draughts. In regard to bathing, this also must be determined by the age, sex, strength, &c. of the patient, and by the season. The degree of heat of the bath should likewise be considered. The tepid ones are in general the best, though there are some cases in which the hotter ones are most proper. But even in these, it is best to begin with the temperate baths, and increase the heat gradually. These waters are efficacious in diseases proceeding from indigestion, and from foulness of the stomach and bowels. In rheumatisms; in the scurvy, scrofula, and diseases of the skin; in hysterick and hypochondriacal disorders; in nervous complaints, and melancholy; in the stone and gravel; in paralytic complaints; in those evils which follow an injudicious use of mercury; and in many other cases. They ought not, however, to be given in hectic cases where there is heat and fever, in putrid disorders, or where the blood is dissolved, or the constitution much broken down. The time of drinking, in the first season, is from the beginning of May to the middle of June; and in the latter season, from the middle of August to the latter end of September. There are galleries or piazzas, under which the company walk during the time of drinking, in order to promote the operation of the waters.—The Poor's Bath, (Campus-bud) is free for every body, and is frequented by crowds of poor people. It is scarcely necessary to add, that there are all kinds of amusements common to other places of public resort; but the sharpers appear more splendid here than elsewhere, assuming titles, equipages, &c.

AIZET-LE-DUC, a town and barony of France, in Burgundy, department of Cote d'Or, nine leagues N. W. of Dijon.

AIZOON, in botany, called by Mr. Miller sempervire, though the name Aizoon has been by some writers applied to the house-leek, and also to the aloes: a genus of the pentagynia order, belonging to the icosandria class of plants; and in the natural method ranking under the thirteenth order, succulentæ. The characters are: CAL. a single leaved perianthium, divided into five segments, and persistent: there is no corolla: STAM. very numerous capillary filaments; the antheræ simple: PIST. a five-cornered germin above, with five simple styli; and the stigmata simple: The pericarpium is a bellied, retuse, five-cornered capsule, having five cells and five valves: The seeds are many and globular. Linnæus mentions three species, viz. 1. Aizoon Canariense, a native of the Canary islands. 2. Aizoon Hispanicum, a native of Spain; and, 3. Aizoon Paniculatum, a native of the Cape of Good Hope. They may all be raised in this country in hot beds; but are not remarkable for their beauty.

AKANIMINA, a town on the coast of Guinea, near cape Apollonia, about three-fourths of a league from the shore. The anchorage is good; and gold dust and ivory are procured here.

AKASAKA, a town on the south coast of the island of Nippon, belonging to Japan, the houses of which were remarked by Kempfer to be larger than those of any other place, even Jeddo the capital. It also contains some elegant inns, and is 100 miles E. of Meaco, 140 W. S. W. of Jeddo.

AKASI, an open town on the south coast of the above island, intersected by a broad and deep river, having a fortress where the governor resides.

AKBAII, a celebrated Saracen conqueror, who overran the whole of Africa, from Cairo to the Atlantic Ocean. At the head of ten thousand of the bravest Arabs, he marched from Damascus, and gradually increased his army by numbers of the barbarians, whom he had conquered and converted. Amid the fictions of oriental writers, it is not easy to follow Akbah through the line of his victories. We know merely that he penetrated with dauntless intrepidity the very heart of the country; and after traversing the wilderness, where his successors erected the capitals of Fez and Morocco, carried his arms to the Western Ocean. Distressed at this limitation which nature had set to his brilliant career, he is said to have spurred his horse into the ocean, and exclaimed, 'Great God! if my course were not terminated by this sea, I would still advance to the unknown regions of the West, preaching the unity of thy holy name, and putting to the sword the rebellious nations that worship any other God than thee.' A general revolt among the Greeks and Africans recalled him from the West, and proved the means of his destruction. The insurgents trusted to the revenge of an ambitious chief, who had disputed the command, and having failed in his designs was led about as a prisoner in the camp of Akbah. He revealed their de-

sign, however, to the Arabian general, who, under the impulse of gratitude, loosened his fetters, and gave him leave to retire. The generous chief chose rather to die with his benefactor, and having embraced each other as fellow martyrs, and broken to pieces their scabbards, they fell by each other's side, after a glorious conflict with the insurgents. Akbah, proposed to establish an Arabian colony in the interior of Africa, in order to check the barbarians and secure a place of refuge to the families of the Saracens. He accordingly founded Cairoan, under the title of a Caravan Station, in the fiftieth year of the Hegira. He encompassed an area 12,000 paces in diameter with a brick wall, and in five years the palace of the governor was ~~enclosed~~ with a number of private dwellings; ~~and~~, a splendid mosque was erected upon five hundred columns of granite, porphyry, and Numidian marble. See *Ockley's Hist. of the Saracens*, vol. ii. *Leo Africanus*, fol. 75. *Shaw's Travels*. *Marmol. Description de l'Afrique*, tom. iii. &c.

AKBAR, or AKBER, sultan, in biography and history, the sixth of the descendants of Timur Bek or Tamerlane, who reigned in Hindostan under the appellation of Moguls, was born in 1542, and succeeded his father Hemain~~t~~ in 1556. He was proclaimed emperor at Calanor, in the province of Lahor, and assumed the title of Jilal D'din, q. d. the aggrandizer of religion. Having overthrown the Patans and taken possession of Delhi, he was inaugurated in the city, and assumed the government which had at first been administered by his tutor, Beyram Khan. He then made himself master of the strong fortress of Chitor, after a severe engagement with a rebel chief, and quelled other insurrections; and having obtained an interval of tranquillity, he made a pilgrimage, barefoot to Azmir, at the distance of 200 miles; for the purpose of visiting the tomb of Haji Mondi, and of obtaining children by the intercession of this saint. During his abode at Fettipur, on his return, he was informed of a rebellion at Guzerat, which hastened his march to this province; and having subdued the rebels, reduced the castle of Surat, and secured the province by fortifying Ahmedabad, he returned to Hindostan. In this year he finished the castle of Agra, at an expense of two millions, five hundred thousand rupees, laid out a million and a half on the walls and palace of Fettipur, and began to erect sumptuous sepulchres of his family at Schander, five miles from Agra. At this time he directed his views to the conquest of Bengal, and having, after a long siege, taken possession of Patan, he became master of the whole country. His next acquisitions were Kabul, Kandahar, Kashmir and Sind. Having united these countries to his empire, he employed a powerful army in the invasion of Dekan, which, notwithstanding vigorous resistance on the part of the queen of this country, subdued several provinces and annexed them to the Mogul empire. Whilst Akbar was engaged in the prosecution of the Dekan war, his prosperity was interrupted by a concurrence of domestic misfortunes. He was deprived of two of his sons, viz. Sultan Morad, in 1598, and Sultan Danul, in 1604, by intemperance; and his son

Selim took the advantage of his absence, for seizing his treasures and marching a numerous army towards Agra, in order to take possession of his father's throne. Akbar, as soon as he received intelligence of his son's rebellion, hastened back to Agra, and having made ineffectual overtures of accommodation, in enforcing which, his vizir Abul Fazl lost his life, he resolved to turn his arms against Selim. But as he had lost his other sons, he once more attempted to persuade his son into submission. With this view he employed the tutor of Selim to convey letters to him, in which he reproached him for his rebellion: but at the same time declared, that, as he was his only son and heir, he was ready to receive him to favour. The father's letters and the tutor's arguments produced effect; Selim returned to Agra and submitted. Akbar at first treated him with austerity, but at length pardoned him, though he still retained suspicions of his son's fidelity. The emperor did not long survive this reconciliation. Being incensed against a mirza, who governed one of his provinces, he resolved to remove him by poison; and for this purpose ordered two pills of opium, in one of which there was poison. Having held these in his hand for some time, he gave one to Mirza, and by mistake took the poisoned one himself. The consequence, notwithstanding the use of remedies as soon as the mistake was discovered, was fatal. When Selim paid his dying father a visit, he put his own turban on this prince's head, and girt him with his father Hemain~~t~~'s sword; but on the twelfth day after he had taken the poison, Akbar died, A.D. 1605, at the age of sixty-three years, and was buried in the family sepulchre near Agra. Akbar was distinguished by his conquests, and by his success in reducing almost the whole of India to obedience. He was also one of the few sovereigns entitled to the appellation both of great and good, and the only one of the Mahomedan race, whose mind was so far divested of the illiberal prejudices of the fanatical religion in which he was educated, as to be capable of forming a plan worthy of a monarch who loved his people, and was solicitous to render them happy. Although he was not attached by profession to any form of religion himself, he was not a persecutor of any. In 1582 he wrote a letter to the king of Portugal, preserved by Fraser, and containing an avowal of sentiments, liberal and enlightened; in which he desires that a translation of the Christian scriptures into Arabic or Persian might be sent to him, and at the same time a learned person to explain the Christian religion. One Geromino Xavier was deputed, and with this view learned the Persian language; but the Gospels, which were translated into this language, and presented to the mogul, 1602, were so intermixed with popish legends, that they were not likely to be very intelligible, or to produce any very good effect. As in every province of his extensive dominions, the Hindoos formed the great body of his subjects, Akbar endeavoured to acquire a perfect knowledge of their religion, their sciences their laws and their institutions; in order that he might conduct every part of his government, particularly the administration of justice, in a

manner as much accommodated as possible to their own ideas. In these generous views he was seconded by Abul Fazl, a minister whose understanding was not less enlightened than that of his master. By their assiduous researches, and the consultations of learned men, such information was obtained as enabled this vizir to publish a brief compendium of Hindoo jurisprudence in the *Ayeen Akbery*, which may be considered as the first genuine communication of its principles to persons of a different religion. In what estimation the mild government of Akbar was held by the Hindoos we may learn from a beautiful letter of Jesswant Sing, Rajah of Joudporc, to Aurengzebe, his fanatical and persecuting successor. ‘Your royal ancestor, Akbar, whose throne is now in heaven, conducted the affairs of this empire in equity and firm security for the space of fifty-two years, preserving every tribe of men in ease and happiness. Whether they were followers of Jesus, or of Moses, of David, or of Mahomet; were they Brahmins, were they of the sect of Dharians, which denies the eternity of matter, or of that which ascribes the existence of the world to chance; they all equally enjoyed his countenance and favour; insomuch that his people, in gratitude for the indiscriminate protection which he afforded them, distinguished him by the appellation of Juggot Grow, guardian of mankind. If your majesty places any faith in those books, by distinction called divine, you will there be instructed, that God is the God of all mankind, not the God of Mahomedans alone. The Pagan and the Mussulman are equally in his presence. Distinctions of colours are of his ordination. It is he who gives existence. In your temples, to His name the voice is raised in prayer; in a house of images, where the bell is shaken, still He is the object of adoration. To vilify the religion and customs of other men, is to set at naught the pleasure of the Almighty. When we deface a picture, we naturally incur the resentment of the painter; and justly has the poet said, ‘presume not to arraign or to scrutinize the various works of Power divine.’ For this valuable communication, we are indebted to Mr. Orme. *Fragment*, notes, p. 97. *Fraser’s Hist. Nadir Shah*, p. 11—12. *Mod. Un. Hist.* vol. v. p. 365—375. *Robertson’s Hist. Disquisition concerning India*. p. 424.

AKENSIDE, (Dr. Mark,) was born 9th of November, 1721, at Newcastle. His father, a butcher, of the same name, belonging to the Presbyterian denomination, had his son Mark taught the rudiments of education in his native town; after which he was sent to the university of Edinburgh, preparatory to his filling the office of dissenting minister, assisted by a fund generally provided to encourage young men of that description. While at the university he altered his views and applied himself to the study of medicine, replacing the money which he had received from the fund. In 1741, he went to the university of Leyden, and three years afterwards took his degree. Here he produced his treatise on the growth of the human fetus, in which he is said to have departed with

great judgment from the opinion then entertained, and to have adopted that which has been since established.

As a poet, he was one of those who displayed great precocity of invention, and felt very early the motions of genius; he, therefore, had his memory well stored with sentiments and images. His chief work, *The Pleasures of Imagination*, appeared in 1774; on which occasion, Dodsley, by whom it was published, relates, that when the copy was offered him for £120, he felt reluctant to make the purchase; but resolved to take the opinion of Pope, who very much admired the composition, and advised him to give the money, assuring him that this was no ordinary writer. Akenside having in this poem adopted the sentiment of Shaftesbury, that ridicule is efficacious for the discovery of truth, Warburton made an attack upon it. The poet nevertheless rose into popularity, and the objectionable passage was expunged. In 1745, he published a collection of odes, which displayed considerable poetic genius, though not equal to his former publication. As a physician, he practised first at Northampton, then at Hampstead, and afterwards in London.

He was enchanted to enthusiasm with the sound of liberty, a great lover of contradiction, and no friend to any thing established. This disposition proved very detrimental to his success. Mr. Dyson, his fellow student, with whom he had contracted a friendship at Leyden, bought a house at North End, near Hampstead, where he supported him, introduced him to the long-room, and to all the clubs and assemblies of the inhabitants. Here, however, his litigious disposition engaged him in so many disputes, that little could be done at Hampstead. Mr. Dyson afterwards thought of introducing him to London; and parting with his villa at North End, took a house in Bloomsbury-square, and allowed Akenside £300 per annum. Here, as at Hampstead, he manifested a very high opinion of himself, and haughtiness towards men of inferior endowments. He engaged in political controversy, censured the public councils, and professed the most bigotted notions respecting government.

In the winter evenings he frequented Tom’s coffee-house, in Devereux-court, the resort of the most eminent scholars of the day. With many of these he shortly became entangled in disputes, and altercations, that fixed on his character the stamp of haughtiness and self-conceit; so that persons who admired him for his genius and parts preserved a respectful distance. His abilities at last began to recommend him: he became fellow of the Royal Society, obtained a degree at Cambridge, entered the college of physicians, became physician to St. Thomas’s hospital, and afterwards physician to the queen. He published several medical treatises, which were highly approved, especially one on dysenteries; read the Gulstonian lectures on anatomy; and might have reached a greater elevation than he ever anticipated, had not death put an end to all his designs and hopes, on the 23d of June, 1770, in the 49th year of his age. He was buried with

great solemnity, in the church of St. James's, Westminster.

With respect to the character of Akenside, he was a man of religion and virtue; a philosopher, a scholar, and a poet. His conversation was of the most delightful kind, learned, instructive, cheerful, and entertaining. He possessed great powers of mind, and his work on the imagination was published before he was 23 years old. He afterwards attempted its revision and correction; but despairing of being able to effect it to his own satisfaction, he resolved to write it anew; finished two books, and part of the two succeeding ones. The original was nevertheless thought so excellent, that it has generally been retained with the corrections. His odes have their dark and light parts; and abound with flights of thought, almost superhuman. His Latin discourse on dysenteries, entitles him to the same place among scholars, as his imaginary works among poets.

AKERMAN, an ancient town of Turkey, in Europe, situated at the mouth of the Dneister, where it falls into the Black Sea.

AKERSTAFF, an instrument for cleansing the plough-coulter.

AKHISAR, or **WHITE CASTLE**, a town of Asiatic Turkey; so called from its quarries of white marble. It stands on, or very near to, the site of the ancient Thyatira. It is about 40 miles S. E. of Pergamos, in a plain, about 18 miles in extent, on the banks of the Hermus, and abounding in grain and cotton. The inhabitants, who are about 5000 in number, carry on some trade in opium and Turkey carpets. Lon. 27° 49'. E. Lat. 38° 15. N.

AKIBA, a famous rabbi, flourished a little after the destruction of Jerusalem by Titus. He kept the flocks of a rich citizen of Jerusalem till the fortieth year of his age, then applied himself to study in the academies for twenty-four years; and was afterwards one of the greatest masters in Israel, having 24,000 scholars. He declared for the impostor Barcochebas, whom he owned for the Messiah; and not only anointed him king, but took upon himself the office of his master of the horse. The troops which the emperor Adrian sent against the Jews, who under the conduct of this false Messiah had committed horrid massacres, exterminated this faction. Akiba was taken, and put to death with great cruelty. He had lived 120 years; and was buried with his wife in a cave upon a mountain not far from Tiberias: his 24,000 scholars being said to be buried round about him upon the same mountain. It is imagined he invented the superstitious work under the name of the patriarch Abraham.

AKILA, or **ST. COLM'S** one of the Hebrides, and lying in W. Lon. 6° 19'. N. Lat. 57° 53'.

AKIN'. Of kin. See **KIN**.

I do not envy thee, Pamela; only I wish, that being thy sister in nature, I were not so far off akin in fortune. *Sidney.*

The cankered passion of envy is nothing akin to the silly envy of the ass. *L'Estrange's Fables.*

Some limbs again, in bulk or stature
Unlike, and not akin by nature,

In concert act, like modern friends;
Because one serves the other's ends. *Prior.*
He separates it from questions, with which it may
have been complicated; and distinguishes it from
questions which may be akin to it.

Watts's Improvement of the Mind.

Their idle sport,
Who pant with application misapplied
To trivial toys, and pushing iv'ry balls
Across a velvet level, feel a joy
Akin to rapture, when the bauble finds
Its destined goal. *Cowper's Task.*

AKISKA, **GHALZIG**, or **TAIK**, a fertile and populous province of Asiatic Turkey, is bounded by Georgia on the north-east. It contains in the mountainous parts the richest mineral ores; and the decayed towns scattered throughout the province, indicate that under a more propitious government it has flourished still more than at present. The aborigines are distinguished by uncommonly fine and thick beards. They practise a rude husbandry, and rear bees and the silkworm. Its capital is

AKISKA, or **AGHALZIGHE**, a town on the banks of the Kur, or Cyrus, containing about 400 houses, and defended by a strong and lofty castle. It is a considerable trading place, especially with Battum, a port on the Black sea. The inhabitants are of all countries and religions. It is distant 90 miles N. N.W. of Erivan; 100 miles S.W. of Teflis.

AKKA, a station of Lower Suse, on the frontier of the Great Sahara, south of Morocco. It forms the rendezvous of the caravans from all parts of Morocco, whence they proceed across the desert of Tombuctoo. Mr. Jackson estimated it to contain, with the neighbourhood, 10,000 inhabitants.

AKLOOSS, a town of the Maharatta territory, in the province of Bejapoore, near Assodnagur. It has a fort and well-supplied bazaar; is nearly a mile in length, and contains several handsome wells and buildings. The Nera river is a little to the north of the town, and is 100 yards broad in the wet season.

AKKER, a city of Syria, upon mount Bargylus, about twenty-seven miles from Tortosa. Shaw supposes that this is the Kir of the Scriptures, (Amos, chap. i. 5, and chap. ix. 7,) and intimates that it must formerly have been as celebrated for its strength and beauty, as it is now for its various kinds of fruits, as apricots, peaches, nectarines, &c.

AKOND, in Persian polity, a judge of the civil courts, whose especial duty it is to preside over the causes of widows and orphans. He possesses deputies in all parts of the Persian empire, and gives directions, or as some say, lectures to all inferior officers.

AKOUSCHY, in zoology, and cavia acuschy, the olive cavy of Pennant, has a short tail; the upper parts of the body of an olive colour, and the under part whitish. It differs from the agouti in having a tail, which the other wants, or rather in having a longer tail than that of the other; in being smaller, and in having its hair of an olive, and not a red colour; differences, says Buffon, sufficient to constitute two distinct species. It is about the size of a half-grown rabbit; is hunted with dogs, easily tamed, and reckoned the

finest game in South America. It inhabits the woods, and lives on fruits; has such a dread of water, that it will submit to be seized by the dogs rather than go into it; and it will sometimes, though rarely, cry like the restless cavy. *Buffon*, by *Smellie*, vol. v. p. 61, &c.

AKSCHINSK, a fortress and village of Russian Tartary, in Dauria, on the right bank of the Onon. It was built by the Russians in the year 1756, and forms one of a series, or chain of military posts, on this portion of the Russian frontier. E. Lon. 132°. N. Lat. 50°.

AKSIHEHR, a town of Natolia, in Asiatic Turkey, at the foot of a mountain of the same name, from whence copious streams of water constantly descend, forming a rivulet through most of the streets. The neighbourhood abounds in beautiful gardens, rich in almost all the fruits of Europe and Asia. Fine carpets, wool, wax, gum, galls, and tragacanth, are exported hence, particularly to Smyrna. This place was taken by Tamerlane in 1402, and is distant 60 miles S. S. E. from Karahissar.

AKTUBA, a river of Asiatic Russia, branching from the Volga, about twelve miles above Tzaritzin, and rejoining it again before it falls into the Caspian. The abundance of mulberry trees on its banks has induced the Russian government to establish colonies here, to promote the culture of silk.

AL, an Arabian particle, answering to the English the, and employed in the same manner to mark any thing distinctly, as Alcoran, from coran, to read; the reading, or book, in distinction from all others. Second, Al, or ald, from the Saxon Aelb, old, is affixed to the name of old towns, as Aldborough, Aldford, &c.

ALA, or ALÆ, in ancient military affairs, the wings of an army, or the horse on each side flanking the foot; and so called because they stood on the right and left, as the wings on the body of a bird. They were also according to Vegetius called vexillationes. *Aul. Gell.* l. 16, c. 4; *Veget. de Re Mil.* l. 2. c. 1.

ALA, ALÆ, or AXILLA, in botany, a wing or membrane on the sides of a petiole or stalk, or attached to a seed or seed-vessel; which last is distinguished by the names of monopterygia or alatae, dipterygia or bialatae, tripterygia or trialatae, &c. according as there is one, two, three, or more wings. Second, the two side petals of a papilionaceous flower. *Linn. Phil. Botan.*

ALA, or ALÆ, in anatomy, μαρχάλη the arm-pit. Hippocrat. de Art.; Gorr. Defin. Med.—Alæ aurium, πτερυγώματα τῶν ὁτῶν, the superior parts of the external ear. Gal. Introd. c. 10, &c.—Alæ, or Alæ Nasi, πτερυγία πινδός, the cartilages which are joined to the extremities of the bones of the nose, and form the moveable part. Gal. de Usu. Part. I. 11.—Alæ ossis Sphenoides, the two apophyses of the os sphenoides.—Alæ, or Alæ Pudendi, the same as Nymphæ.

ALABA, a small district of Biscay, in Spain, fertile in rye, barley, and fruits. There are in it very good mines of iron, and it had formerly the title of a kingdom.

ALABAH, a river of East Florida, North America, also the name of a branch of St. Mary's river.

ALABAMA, an Indian village of North America, on the banks of the Mississippi, where reside the remains of the Alabama nation, who, before they were conquered by the Creeks, inhabited the east side of the great Mobile river.

ALABAMA, a river of North America, formed by the junction of the two rivers of Georgia, the Coosa, and Tallapoosse. It is a beautiful stream abounding with fish, and having a current running about two miles an hour. It takes a south-westerly direction, until it meets the Tombighee from the north-west. The Alabama forms a quick and pleasant conveyance by boats from Little Tallasee to Mobile bay, a distance of about 350 miles, and finally empties itself into the Gulf of Mexico: its banks abound with trees and vegetables. It is eighty rods wide at its head, and from fifteen to eighteen feet deep at the driest season. An American writer says, that 'to go from Mobile to Fort Jackson, a distance of about 420 miles, will take from a month to six weeks, according to the state of the river.' 'A barge, with five hands, and carrying 125, barrels,' has gone this distance in thirty days; 'but it was reckoned a remarkably good trip.' Settlements on the banks of this river are rapidly increasing, especially in the country lying between it and the Tombighee.

ALABAMA TERRITORY, OR STATE, a newly settled state or territory of the great northern republic of America—the United States, is situated between thirty and thirty-five degrees of north latitude. Its boundaries, as established by law on the 3d of March, 1817, are as follows: beginning at the point where the line of the thirty-first degree of north latitude intersects the Perdido river, thence east to the western boundary line of the state of Georgia, thence along the said line to the southern boundary line to the state of Tennessee, thence west along the said boundary line to the Tennessee river, thence up the same to the mouth of Bear creek, thence by a direct line to the north-west corner of Washington county, thence due south to the Gulf of Mexico, thence eastwardly, including all the islands within six leagues of the shore, to the Perdido river, thence up the same to the beginning. It has the new state, formed from the western part of the Mississippi territory, on the west; Tennessee north; Georgia and the remnant of West Florida east, and the Gulf of Mexico and West Florida south. These boundaries comprise about one half of the late Mississippi territory, which contained about 93,480 square miles, or 59,827,200 acres.

The main rivers of this territory run south, and fall into the Gulf of Mexico. The Alabama described above, is the most considerable.

The Coosa, under the names of Connesangah, Estenaury, Hightour, &c. runs probably above 150 miles, estimating the distance by land, through the Cherokee territory, in the north-west corner of the state of Georgia.

The country between the Mobile and the Catahouche, is about 180 miles wide, and watered by the Perdido river, which forms the boundary between the Alabama territory and the remnant of West Florida; it runs parallel to the Mobile, and falls into Perdido Bay. The streams are the

Conecah and Escambia, whose waters unite and flow into Pensacola Bay; the Conecah is navigable upwards of 100 miles, and is lined by forests of valuable timber. Beyond the Escambia is Yellow-water river, which falls into the Bay of Pensacola. Choctaw and Pea rivers, still further east, fall into the Bay of St. Roses. These streams are all navigable from fifty to 100 miles; the country which they drain is mostly of a sandy soil, and pine timber.

The Catahouchee is a noble river, affording a navigation of 400 miles; heads in the south-east corner of Georgia, pursues a south-west course 300 miles until it strikes the boundary line between Georgia and the Alabama territory, when itself becomes the division line to the limits of West Florida, a distance of 120 miles.

The northern parts of this territory are broken; near the Tennessee line, towards the south-east corner, it may be said to be mountainous. The middle is hilly, with here and there tracts of level prairie land. Along the Florida line is a strip of country fifty or sixty miles wide, covered with the short and long leaved pine, cypress, and loblolly, so closely resembling the country between Pearl river and the Mobile, as to render a description of the one applicable to the other. Such are its general aspects. The soil between the Mobile and the Catahouchee, bordering West Florida, is better than that on the east side of Flint river; between the Conecah and the Catahouchee the land is broken and waving; the ridge dividing their waters has high flats of light sandy land, well set with willow-leaved hickory, and iron ore in places; all the streams have cane on their margins, and are frequently ornamented with the sour orange tree; the country healthy, and affording a fine range for cattle, hogs, and horses. The pine flats have the wire grass and saw palmetto: the soil of the waving land, stiff and red loam, with stone on the ridges; the pine land pretty good for corn. Between the Mobile and the Perdido, the soil is thin, timber pine, loblolly bay, cypress. The head waters of Escambia and Conecah embrace large quantities of fine cotton and sugar lands, and orange groves. Along the Tensaw, pine and cypress forests, of a heavy growth; canebrakes, along the river; and sometimes cypress swamps. The Alabama is margined with cane swamps; these at intervals, with pine flats of good soil, suitable for sugar, cotton, and corn. The swamps at the confluence with the Tombigbee, and for some distance below, are subject to periodical inundations, for which reason the inhabitants never fence their improvements. Above they are very wide, interspersed with slashes and crooked drains, and much infested with mosquitoes. The land bordering on the swamps is a poor stiff clay, for one mile back, the growth pine and underbrush; back of this, broken pine barren; cypress ponds and canebrakes on the branches. Fifty miles from the union of the Alabama with Tombigbee, the high broken lands commence, extending for sixty miles upwards; timber, oak, hickory, poplar, and very large cedars.

The best part of the territory is to be found between the Alabama and Tombigbee; the Black

Warrior, and Bear creek, have some fine bottoms; and those of the Tallapoosa from Tookabatches to its confluence with the Coosa, about thirty miles, are excellent; the broken land terminates on its right bank, the good land spreads out on the left. Proceeding towards the dividing ridge, between the Alabama waters and those of the Conecah, we pass over an extensive tract of rich land, the timber large, and cane abundant, liberally watered by creeks; this tract is thirty miles long including the plains, and twenty wide. The plains are waving, hill and dale, and appear divided into fields, interspersed or bounded with clumps of woodland; soil lead-coloured or dark clay, very rich and covered with weeds and tall grass. Below the plains, soil stiff, very red in some places, and gravelly; surface broken for thirty miles, then pine barren. At the sources of Limestone creek, there is an excellent body of land called the Dog wood; the growth oak, chesnut, poplar, pine, and dogwood. This vein of land is twenty miles in length, and eight broad; the dogwood is very thick set, and tall, the whole finely watered. Sixty miles above the confluence of Coosa and Tallapoosa, there is a high waving country, settled by the Creek Indians, who live generally on rich flats of oak, hickory, poplar, walnut, and mulberry: the springs are fine; cane on the creeks, and reed on the branches; the surrounding country broken and gravelly. Most kinds of game are scarce throughout the territory. Stone coal abounds on the Cahaba, Black Warrior, &c. The late colonel Hawkins, long resident in the Creek nation, pourtrays the surface and soil of this country in these words:

The country between Coosa, Tallapoosa, and Chatahouchee, above their falls, is broken; the soil stiff, with coarse gravel, and in some places stone. The trees post oak, white and black oak, pine, hickory, and chesnut; all of them small; the whole well watered, and the rivers and creeks have rocky beds, clad in many places with moss, greatly relished by cattle, horses, and deer, and are margined with cane and reeds, and narrow strips or coves of rich flats. On the Coosa, sixty miles above its junction with Tallapoosa, there is limestone, and it is to be found in several places from thence to E-towoh, and its western branches.

Above the falls of Ocmulgee and Flint rivers, the country is low and broken, as that of the other rivers. These have their sources above each other; on the left side of Chatahouchee, in open flat land, the soils stiff, the trees post and black oak, and small. The land is generally rich, well watered, and lies well, as a waving country, for cultivation; the growth of timber, oak, hickory, and the short leaf pine, pea vine on the hill sides and in the bottoms, and a late (or autumnal) broad leaf grass on the richest land. Below the falls of these two rivers, the land is broken or waving, the streams are some of them margined with oak woods; and all of them with cane or reed. The uplands of Ocmulgee are pine forests; the swamp wide and rich; the whole fine for stock. On its right bank, below the old Uchee path, there is some light pine barren, with some light palmetto grass.

Flint river has also, below its falls, some rich

swamp for not more than twenty miles; its left bank is then poor, with pine flats and ponds, down within fifteen miles of its confluence with Chatahouchee. These fifteen miles are waving, with some good oak land in small veins. On its right bank there are several large creeks which rise out of the ridge, dividing the waters of Flint and Chatahouchee. Some of them margined with oak woods, and cane; and all the branches for seventy miles below the falls have reeds: from thence down, there are bay-galls, dwarf evergreens, and cypress ponds, with some live oak. Between these rivers there is a good post, and black oak land, strewed over with iron ore, and the ridge dividing their waters has a vein extending itself in the direction of the ridge. Within twenty-five miles of the confluence of the rivers, the live oak is to be seen near all the ponds; here are limestone sinks; the land is good in veins, in the flats, and on the margins of the rivers. The trees of every description small; the range a fine one for cattle.

The extensive body of land between Flint river and Oke-fau-no-cau, Altamaha and the eastern boundary of the Creek claims, is pine land, with cypress ponds and bay-galls. The small streams are margined with dwarf evergreens; the uplands have yellow pine, with dwarf, saw palmetto and wire grass; the bluffs on St. Illas are some part of them sandy pine barren; the remainder a compact, stiff, yellowish sand or clay, with large swamps; the growth loblolly, bay, gum, and small evergreens; the whole of these swamps are bogs. In the rainy season, which commences after midsummer, the ponds fill, and then the country is, a greater part of it, covered with water; and in the dry season it is difficult to obtain water in any direction for many miles.

Bees abound in the Okefaunocau and other swamps eastward of Flint river; the whortleberry is to be found in swamps and on the poorest land bordering on the cypress ponds, when the woods are not burnt for a year or more; the latter are on dwarf bushes, grow large, and in great abundance. The dwarf saw-palmetto, when the woods are not burnt, in like manner, bears a cluster of berries on a single stone, which are eaten by bears, deer, turkeys, and Indians. The berries, half an inch thick, are covered with a black skin, and have a hard seed: they are agreeable to the taste, sweet accompanied with bitter, and when fully ripe they burst, and the bees extract much honey from them. The China briar is in the flat, rich, sandy margin of streams. The Indians dig the roots, pound them in a mortar, and suspend them in coarse cloth, pour water on them, and wash them; the sediment which passes through with the water is left to subside; the water is then poured off, and the sediment is baked into cakes, or made into gruel sweetened with honey. This briar is called Coonte, and the bread of it Coon-tetcaliga, and is an important article of food among the hunters. In the old beaver ponds, and in thick boggy places, they have the bog potatoe, a small root used as food in years of scarcity.

The Okefaunocau is the source of St. Mary's

and Little St. Johns, called by the Indians Sau-wau-he. It is sometimes pronounced Ecunfinocau, from Ecunau earth, and finocau quivering; the first is the most common among the Creeks—it is from Ocka, a Choctaw word for fire and water; Ocau, quivering. This is a very extensive swamp, and much of it a bog; so much so, that a little motion will make the mud and water quiver to a great distance; hence the name is given.

The settlements already made extend from Mobile point to Fort Jackson on the Coosa. On the Alabama the country is pretty well settled near the river, twenty-five miles above Fort Jackson. There are also settlements on the Coneah, Cahaba, and Black Warrior. Below St. Stephens the country is very thinly settled; but it is now rapidly settling between the Alabama and Tombigbee.

There are several new towns; the village of Blakely is situated at the mouth of Tensaw, on the east side of the Mobile bay. Its site is high, commanding, and pleasant. Its fountains of fresh spring water, are pure, cool, numerous and copious. A good road can be found along the dividing ridge separating the branches of Coneah and Escambia from those of the Alabama; and the distance from Mobile to Fort Claiborne, by this route, is thirty miles shorter than by that of St. Stevens. The main road from Georgia to New Orleans will probably strike Mobile bay at this point. The borders of the Coneah are fast settling, especially by the poorer class of people, and Stock owners; it being better calculated for men of small capital than the Alabama. The rapidity of the settlement of Madison county is probably without a parallel in the history of the union. We subjoin the census of 1816.

This territory is rapidly augmenting its inhabitants, by emigrants from Georgia, the Carolinas, Kentucky and Tennessee.

The Creeks or Muscogees, are the only Indians inhabiting the territory, and reside chiefly on the waters of Alabama and Catahouchee, in about thirty towns; they are brave, raise stock, and cultivate the soil; and although greatly reduced by war and famine, in 1813 and 1814, their number at this moment exceeds 20,000 souls.

In 1819 the population of this territory rising above 60,000 souls, it was admitted 14th of December of that year, into the confederacy or general Union, as a distinct State: in 1821 its population, according to the census, was 85,451 whites; 41,879 slaves; and 415 free blacks.

ALABANDA, in ancient geography, a town of Caria, near the Meander, situated between Amyzo to the west, and Stratonic to the east.

The place abounded in scorpions, and the inhabitants were remarkable for their voluptuousness. Under the Romans it was the head of a jurisdiction, and it still retains some relics of its former splendour.

ALABANDI, ALABANDENI, or ALABANDENSES, the inhabitants of Alabanda. Under the Romans they had assizes, or a convention of jurisdiction.

ALABANDUS, the founder of Alabanda, and worshipped as a god by the natives.

ALABARCHA, in antiquity, a kind of magistrate among the Jews of Alexandria, whom the emperors allowed them to elect, for the superintendency of their police, and to decide differences and disputes which arose among them.

ALABARDA, the name of a spear anciently used by the Helvetians and Germans.

AL'ABASTER, n. Αλαβαστρον, a kind of soft marble, generally white. Used by the ancients to make boxes for perfumes.

A womman cam that hadde a boxe of *alabastre* of preciouse oyement spikenard, and whanne the boxe of *alabastre* was brokun sche helede it on his heed.
Wyclif. Mark xiv.

Why should a man, whose blood is warm within,
Sit like his grandsire cut in *alabaster*?
Sleep when he wakes? and creep into the laundies
With being peewish. *Shaksy. Merchant of Venice.*

Yet I'll not shed her blood;
Nor scar that whiter skin of hers, than snow;
And smooth as monumental *alabaster*.
Shakspeare.

It was a rock

Of *alabaster* piled up to the clouds
Conspicuous far. *Milton's Par. Lost*, b. iv.

ALABASTER, albâtre, Fr. alabastres of Pliny, in mineralogy a species of that genus of stones whose base is calcareous earth. It differs from marble in being combined, not with the aerial, but with the sulphuric acid. Hence no effervescence appears when it is mixed with any acid. Some derive the word from *albus*, on account of the whiteness of this stone. Others from *ἀλαβάστρον* formed of the privat. *α* and *λαβάσων*, capio, to take, this stone being too smooth and slippery for the hand to take fast hold of it. Under this name are confounded two minerals wholly distinct from each other when pure, but occasionally mixed in some of the varieties.

The compact gypsum of Kirwan, (*Alabastrite, La Meth, albâtre gypseux de Lisle* Dichter Gypstein, Werner) when of a white yellowish or greenish colour, semi-transparent, and capable of receiving a polish, is called among statuaries alabaster, and is characterized by Pliny under the word *alabastrites*, as a stone resembling gypsum. When its colours are disposed in bands or clouds, it is called in the first case onyx alabaster, and in the second agate alabaster. Considerable confusion, however, often arises between the distinctions of statuaries, and those of chemists, amongst the stones known by the name of marble, and distinguished by a variety of denominations. Alabasters, according to statuaries, are those which have a degree of imperfect transparency, a granular texture, are softer, take a duller polish than marble, and are usually of a whiter colour. Some stones of a veined and coloured appearance have nevertheless been

called alabasters from their possessing a slight transparency; and other yellow sparry stones have been thus denominated for the same reason. Alabasters among chemists, are only such opaque, consistent, and semi-transparent stones as are composed of lime, united with the sulphuric acid, and hence are often confounded with the selenites and gypsums, or plaster of Paris. The semi-opaque appearance and granular texture, are the effects either of a disturbed or a successive crystallization, which would else have formed transparent spars. The calcareous stalactites, or drop stones, formed by the transition of water through the roofs of caverns, differ nothing in appearance from alabaster, most of which is formed after the same manner. It is, however, necessary to observe, that the calcareous stalactites consist of calcareous earth and carbonic acid; while the alabaster of the chemists is composed of the same earth and sulphuric acid.

What some writers have distinguished as the gypseous alabaster is very easily worked, and susceptible of considerable polish. It is made into vases, columns, tables, &c. Some thin slabs of it have been used in one of the churches of Florence, instead of window-glass. That most esteemed among the ancients came from Caramania, Syria and Upper Egypt. The boxes for holding perfumes, mentioned both in sacred and profane history, were formed of the variety, called onyx, hence in Horace, 'Nardi parvus onyx.' The calcareous alabaster exhibits considerable variety of colours, such as white, yellowish, greenish, reddish, and bluish-grey. Its hardness is inferior to marble, its polish considerable, and its fracture striated or fibrous, the striae sometimes parallel, and at others divergent. Its transparency is nearly equal to that of white wax, and its gravity from 2.4 to 2.8. Two sorts of alabaster have been distinguished by statuaries, the common and oriental, the latter including the hardest, finest, and best coloured pieces; numerous sub-varieties are produced by the colours being in veins, or dendritic, or in concentric undulating zones. The most beautiful specimens are brought from Italy and Spain; others of an inferior description are found in Germany and France. That of Montaiout near Rome, is remarkable for its whiteness and the bigness of its blocks, some of which are so large, that statues as big as the life may be easily cut out of them. F. Labit, in his journey to Italy, observes, that there are quarries of alabaster in the neighbourhood of the village called de la Tossa, near Civita Vecchia: there is also alabaster to be found in some places of Lorrain; but it is not much esteemed. The most common species of alabaster are,

1. **ALABASTER**, the snow white shining, or lygdnium of the ancients, it is found in Taurus, in pieces large enough to make dishes, or the like. It cuts freely, and is capable of a fine polish

2. **ALABASTER**, the variegated, yellow and reddish. This species is the common alabaster of the ancients, and is so soft that it may be cut with a knife: It is remarkably bright, and almost transparent; admits of a fine polish, and consists of large angular sparry concretions. It is not proof against water; it ferments violently

with aquafortis, and burns to a pale yellow. The colour of this species is a clear pale yellow, resembling amber, and variegated with undulated veins; some of which are pale red, others whitish, and others of a pale brown. It was formerly brought from Egypt, but is now to be met with in several parts of England.

3. ALABASTER, the yellowish, or phengites of Pliny, is found in Greece; and is of a soft, loose, open texture, pretty heavy, and nearly of the colour of honey. This species has likewise been found in Germany, France, and in Derbyshire in England. The alabasters are frequently used by statuaries for small statues, vases, and columns. After being calcined and mixed with water, they may be cast in any mould like plaster of Paris. See GYPSUM.

In many places hot sulphureous waters rise out of the ground, of a turbid wheyish colour, occasioned by a quantity of gypsum or chalk, which they hold suspended in a state of half solution. In proportion as these grow cool and lose their carbonic acid, the earthy particles are deposited, leaving the channels through which they flow covered with a compact alabaster, or a thick crust of stalactite of a dazzling white, especially when the sun shines upon it. The most remarkable spring of this description in Europe, is situated on a mountain near Radicofani. It supplies the baths of St. Philip in Tuscany, and forms the source of the little river Paglia. Advantage has been occasionally taken of this circumstance, to obtain very beautiful impressions of bas reliefs, by exposing the moulds to a current of such water, till they have become filled with the earthy deposit. The hardness of the alabaster depends upon the degree of obliquity at which the mould is placed to receive the dashing of the water. The more vertical the position, the harder the alabaster. The hardest models not being so white as the softer, the water is frequently caused to make a circuitous course before it reaches the mould, that all the grosser particles may be previously deposited. Even the softer ones, however, are as hard as Carrara marble, and surpass it in whiteness. The time required for these productions varies, according to the thickness, from one month to four. When the mould is sufficiently filled, and the ground of the model has acquired a thickness capable of supporting the figures, the whole is removed from the water; the wooden supports are broken by gentle strokes of the hammer, and the incrustation on the outside of the mould is chipped off by repeated strokes. Then the tub is struck with a smart blow of a hammer, which separates the model from the mould; generally, however, cracking the latter. The brilliancy of the models is completed by brushing them with a stiff hair-brush, and rubbing with the palm of the hand, when they become semi-transparent and very beautiful.

The composition of this alabaster is gypsum, mixed with a small proportion of carbonated lime. Dr. de Vegni has, after many attempts, succeeded in giving a fine black, or flesh colour to the figures thus formed, by putting a vessel half full of colouring matter into the water, be-

fore it arrives at the mould. The colouring may also be varied by protecting particular parts of the mould, while the water continues charged with colouring matter.

Mr. Boyle observes, that alabaster being finely powdered, and thus set in a basin over the fire, will, when hot, assume the appearance of a fluid, by rolling in waves, yielding to the smallest touch, and emitting vapour; all which properties it loses again on the departure of the heat, and discovers itself a mere incoherent powder.

ALABASTER, in antiquity, from the frequent use of the stone so called for that purpose, frequently denotes a vase or vessel wherein odiferous liquors were preserved. Pliny says expressly (*Nat. Hist. lib. 33. c. 8.*) that of the alabaster stone (*albastreum*) they make vessels to hold ointments, which it is said to preserve free from corruption. It is found about Thebes in Egypt, and Damascus in Syria. The latter is the whiter of the two. Kypke, in *Matt. xiv. 3.* cites from Plutarch, in *Alexandro*, p. 676, a variety of vessels, *kai αλαβαστρος, παντα χρυσες ησημενα περιττως*, and *alabasters*, all curiously wrought with gold. In *Theocritus* we read of Συριω δε μυριι χρυσει αλαβαστρα, golden alabasters, full of Syrian ointments. Herodotus has a similar expression, *lib. iii. c. 20.* respecting the presents of Cambyses to the king of Ethiopia.

The expression, *συντριψασα το αλαβαστρον*, *Mark, xiv. 3.* which our translators have rendered 'she brake the box,' has occasioned some difficulty to critics: bishop Pearce referring the *συντριψασα* to the ointment, and not to the box; renders the words, 'breaking she poured the box;' i. e. breaking the parts of the ointment, and liquifying them by shaking it, she poured some of the ointment out of the box upon his head; others with Mr. Wakefield, write; 'after shaking the box together, she poured it out upon his head,' and to justify this translation, it has been observed, that Luke, ix. 39, uses *συντριψων* for bruising. Blackwall, *Sacred Classics*, vol. ii. p. 166. has remarked that the shaking of liquids of this nature breaks and separates their parts, and thereby makes them more liquid and fragrant; and that the word *συντριψασα* is an excellent one for that purpose; quoting Plato in *Phædone*, Διατριψας το φαρμακον: Martial's Epigrams, iii. 45. ed. Delphini.—'Et fluere excusso cinnama fusa vitro,' and Lucretius, iv. 700.

—'Fracta magis redolere videntur
Omnia quod contrita.'

See Pearce's *Com. vol. 1. p. 276.* Wakefield's *Silva Critica.* Pars. 1, ma. p. 156.

Sir Edward Knatchbull and Dr. Hammond have suggested the same interpretation of this passage. But Dr. Campbell insists from the syntax of the passage that the *συντριψασα* must refer to the vessel, and seems best to meet all objections by translating the phrase 'she broke open the box,' &c. We apply such a phrase as this, constantly to the opening of a letter, and it is not improbable that the ointment might be sealed up in the vessel in the manner that otto of roses is still imported from the east. ALABASTER is also said to have been used for an ancient

liquid measure, containing ten ounces of wine, or nine of oil, and in this sense was equal to half the sextary.

ALABASTER, or **ELEUTHERA** Island, in geography, one of the Bahama or Lucayo islands, on the great Bahama bank. Its climate is said to be healthy, and the soil, which is chiefly at the north end, better than that of Providence Island. Pine-apples are exported from Alabaster Island in considerable quantities. There is a small fort and garrison on the island. Lon. $76^{\circ} 22'$. to $76^{\circ} 56'$. W. Lat. $24^{\circ} 40'$. to $26^{\circ} 30'$. N.

ALABASTER, (William,) an English divine, was born at Hadley in the county of Suffolk; and attended the earl of Essex, as chaplain in the expedition to Cadiz, in the reign of queen Elizabeth. He was one of the controversial writers of the period; but, with other warm disputants, of little personal steadiness: not having been long on the continent before he joined himself to the Romish communion, and publicly abjured protestantism. He, however, could not reconcile himself to the discipline of that church, which paid no regard to his previous degrees, or heretical ecclesiastical character. He soon returned to England, and resumed his former religion, when he obtained a prebend in the cathedral of St. Paul, and the rectory of Therfield in Hertfordshire. He was well skilled in the Hebrew tongue; but studied the Cabala, until he well merited Festus's reproach of St. Paul: he preached a mystical sermon, upon taking his degree of D. D. at Cambridge, from 1 Chron. i. ch. 1. v. Adam, Seth, Enos! His verses were greatly esteemed. He wrote a Latin tragedy, entitled Roxana, which, when acted in a college at Cambridge, was attended with a very remarkable accident; a lady being so terrified at the last word, Sequar, Sequar, pronounced with a vehement tone, that she lost her senses for life: he also wrote, Apparatus in Revelationem Jesu Christi, printed at Antwerp in 1607. But the only work of his worth notice, is a Lexicon Pentaglotton, which he published in folio. He died in 1640.

ALABASTRA, in plants, are those little herbaceous leaves which encompass the bottoms of flowers, particularly the rose. See **CALYX**, &c. Some, with Jungius, explain alabastra, by the globe or roundish bud of the rose just peeping out.

ALACANANDA RIVER, a river of Hindostan, which springing from the Himalaya mountains, in Serinagur, joins the Bhagirathi, at Devaprayaga, the junction of the two forming the celebrated river Ganges. The superstitions connected with this stream, will justify our giving a few particulars of its rise. A short distance north of Bhadrinath, the breadth of the Alacananda does not exceed twenty feet, the stream being shallow, and moderately rapid. Further up it is concealed under immense heaps of snow, which have not been disturbed for ages, although the shastras mention a city nearer its source, called Alacapura, the fabulous abode of Cuvera, the pluto of Hindoo mythology. At their junc-ture, the Alacananda is larger than the Bhagirathi, being 142 feet in breadth, and in the rainy season forty-six and forty-seven feet above the low water

level. At Ranibagh, the breadth of the Alacananda is from seventy to eighty yards, with a current of seven to eight miles an hour. Many fish of the roher species, cyprinus denticulatus, four or five feet in length, haunt this stream, and are fed daily by the Brahmins, from whose hands they will take bread. There is also a beautiful, and remarkably delicate, species six or seven feet long.

ALACHUA, an ancient town on the borders of the Savannah of that name in East Florida, and about seventy-five miles west of St. Augustine. The Indians removed to Cuscowilla, two miles distant, on account of the unhealthiness of this spot: but the soil around is very fertile, and the Savannah, surrounded with high sloping hills, covered with waving forests, and fragrant orange groves, is about fifteen miles over, and fifty in circumference.

ALACRANES, an extensive range of hidden rocks, shoals, and banks, opposite the coast of Yucatan. They lie east from Stone Bank, and west from Cape St. Antonio, on the south side of the gulf of Mexico, within the twenty-third degree of north latitude, and between the eighty-ninth and ninety-first degree of west longitude. Those who navigate these parts pass round, in place of venturing among them, although there are some good channels and soundings.

ALACRITY, *n.* { Lat. *Alucris*; merry, ALACRIously, } cheerful, brisk, cheerful

ALACRIOUSNESS, } activity; the effect of a willing mind.

For as the holy doctor saint Chrisostome saith, though pain be grievous for the nature of ye affliction, yet it is pleasaunte by the *alacrity* and quick mind of them that willyngly suffer it.

Sir Thomas More's Works, p. 75. col. 1.

These orders were, on all sides, yielded unto with no less *alacrity* of mind; than cities, unable to hold out any longer, are wont to shew; when they take conditions, such as it liketh him to offer them, which hath them in the narrow straits of advantage. *Hawker.*

Give me a bowl of wine:

I have not that *alacrity* of spirit,
Nor cheer of mind, that I was wont to have.

Shakespeare.

He glad, that now his sea should find a shore,
With fresh *alacrity* and force renew'd,
Springs upward.

Milton's Par. Lost.

Never did men more joyfully obey,
Or sooner understood the sign to fly:
With such *alacrity* they bore away,
As if, to praise them, all the states stood by.

Dryden.

Epaminondas *alacriously* expired, in confidence that he left behind him a perpetual memory of the victories he had achieved for his country.

Government of the Tongue.

ALACUOTH, among Arabian physicians, an infirmity of the nerves, attended with diarrhoea in some peculiar circumstances.

ALADINE ISLANDS, are a cluster of small islands in the bay of Bengal, near the coast of Siam, and in the south of what is sometimes called the Mergui Archipelago. They run from $9^{\circ} 5'$. to $9^{\circ} 40'$. N. Lat. and are in $97^{\circ} 52'$. E. Lon. The chief islands are Alexander's Peak, Auriol's, Bruer's, Christie's, Davis's Dunkin's, Graham's and Watson's.

ALADINISTS, a sect among the Arabs, answering to freethinkers among us. They multiplied greatly under the kings Almonsor and Miramolinus.

ALADULIA, a province of Turkey, in Asia, in Natolia, between the mountains of Antitaurus, which separate it from Amasia on the north, and from Caramania on the west. It has the Mediterranean sea on the south, and the Euphrates on the east, which divides it from Diarbeker. It comprehends the Lesser Armenia of the ancients, and the east part of Cilicia. Formerly it had kings of its own; but the last king was beheaded by Selim I. emperor of the Turks, who had conquered the country. It is now divided into two parts: the north, comprehended between Taurus, Antitaurus, and the Euphrates, is a beglerbeglic, which bears the name of Marasch, the capital town; and the south, seated between mount Taurus and the Mediterranean, is united to the beglerbeglic of Aleppo. The country is rough, ragged, and mountainous; yet there are good pastures, and plenty of horses and camels. The people are hardy and thievish. The capital is Malatigah; Adana and Marisch are also considerable places.

ALE, in botany, the plural of **ALA**, which see.

ALAGNON, a principal river of Auvergne, in France, which rises at Cantal, through the department of which it has part of its course, is very rapid, and runs into the Allier, between Issoire and Brioude.

ALAGOA, a town in the island of St. Michael, one of the Azores, which has two parish churches. It is eight miles east of Point Delgada.

ALAGON, a town of Spain, in the kingdom of Arragon, seated on a peninsula, formed by the rivers Ebro and Xiloca, twelve miles northwest of Saragossa.

ALAIÀ, *pithisis*, in Med. *ἀλαίᾳ φθίσις*, from *ἀλαῖος*, blind; a consumption caused by a fluxion of humours in the head.

ALAIID, a volcanic peak in the Okhotsk sea, near the first of the Kurile islands. It began to emit volumes of smoke in the year 1790; and about three years afterwards flamed with great fury; but no mischief appears to have been done by this eruption.

ALAIN, a river, in the province of Quito, South America, which, after running in a north-east direction, enters the Pucuré.

ALAIN, (Chartier,) secretary to Charles VII. king of France, was born in the year 1386. He was the author of various pieces; but his Chronicle of King Charles VII. is his only work of importance. Giles Coroxet states, that Margaret, daughter to the king of Scotland, and wife to the dauphin, passing once through a hall where Alain lay asleep, she stooped and saluted him in the presence of her retinue: some of whom telling her, that it was strange she should kiss a man who had so few charms in his person, she replied, 'I did not kiss the man, but the mouth from whence proceeds such excellent sayings, and so many wise discourses.' Fontenelle has constructed one of his Dialogues of the Dead, upon this incident. Pasquier compares Alain to Seneca, on account of the elegance of his writings.

ALAINS, a barbarous northern race, who, in

the fourth and fifth centuries, joined the Goths and Vandals, and overspread a great part of the south of Europe, and the north of France, carrying terror and desolation wherever they went.

ALAIS, **ALETS**, or **ALAS**, a town of France, in the department of Gard, seated on the Gardon, near a beautiful plain, at the foot of the Cevennes. It is the head of an arrondissement, and contains 9000 inhabitants. The annual export of raw silk from it is considerable, and the town carries on a good trade in grain, olives, oil, wine, and several manufactures of the district. A hot medicinal spring issues from the adjacent mountains, and many openings in the rocks show that mines have formerly been wrought in them. A fort was built in it, in 1689. It is situated fourteen leagues north of Montpellier, and 140 south by east from Paris.

ALAISEE, in heraldry, the same with bumetty or racourcy.

ALAKTUGAL LAKE, a lake of Chinese Tartary, in Mongolia, a short distance east from the Balkash lake. It has a large island in its centre, and has on its east, Kiurgha Lake. N. Lat. 45°. E. Lon. 74°. 15'.

ALALCOMENÆ, in ancient geography, a city of Boeotia, where Minerva is said to have been born. Hence Homer applies the epithet *ἀλακομενῆς Αἰηνῆ* to the goddess. She had a famous temple here.

ALALCOMENIUS, in ancient chronology, the Bootian name for the Athenian month Maimacterion, which was the fourth of their year, and answers to the latter part of our September and beginning of October.

ALALIA, in ancient geography, *ἀλαλίη*, a town of Corsica built by the Phocans, and destroyed by Scipio 526 A. C. but rebuilt by Sylla. *Herod.* 1. i. c. 165

ALAM, *ED AL ALAM*, in biography, a great mathematician, who lived in the reign of the sultan Adhdaedoulat.

ALAMAGAN, or Conception Island, one of the Ladrones, about eighteen miles in circuit. It lies between the Guguan and Pagon, eleven miles from the former, and thirty from the latter. Lat. 18°. 10'. N.

ALAMANDUS, (Lewis,) Fr. **ALEMAN**, archbishop of Arles, and cardinal of St. Cecilia, was one of the greatest men of the fifteenth century. He presided in the council of Basil, which deposed Eugenius IV. and elected the antipope, Felix V. and is much commended by Æneas Sylvius, for his firm and vigorous conduct on that occasion. One day he so eloquently harangued against the superiority of the pope over the council, that several persons pressed to kiss him; and even to embrace his robe. Though deprived of his dignities by pope Eugenius, Almandus died, in the odour of sanctity, and performed so many miracles after his death that, at the request of the canons and Celestine monks of Avignon, he was beatified by Clement VII.

ALAMANNI, (Lewis,) was born at Florence, of a noble family, on the 28th of October, 1495. He was obliged to fly his country for a conspiracy against Julius de Medicis, who was soon after chosen pope under the name of Clement VII. During this voluntary banishment, he went into France; where Francis I. from a regard to his

genius and merit, became his patron. This prince employed him in several important affairs and honoured him with the collar of the order of St. Michael. About the year 1540, he was admitted a member of the Inflammati, an academy newly erected at Padua, chiefly by Daniel Barbaro and Ugolin Martelli. After the death of Francis, Henry duke of Orleans, who succeeded him in 1537, shewed no less favour to Alamanni; and in the year 1551, sent him as his ambassador to Genoa: this was his last journey to Italy; and being returned to France, he died at Amboise, A. D. 1556, in the sixty-first year of his age. He left many beautiful poems, and other valuable performances, in the Italian language; as well as some notes upon Homer's Iliad and Odyssey. Those upon the Iliad were printed in the Cambridge edition of Homer in 1689, and Joshua Barnes also inserted them in his fine edition of Homer in 1711.

ALAMANNICUM, in antiquity, a tribute imposed on the people by the emperor Alexius Angelius, for raising the sum of sixteen talents of gold, to be paid the Alamanni, on the condition of a peace stipulated with them. The ecclesiastics themselves were not exempted from this tax.

A LA MESURE, in Italian à tempo, in music, in strict time.

A LA MI RE, in music, an Italian method to determine the key of A, by its dominant, and subdominant, A E D. In the Guidonian scale of music a-la-mi-re is the octave above a-re, or A in the first space  in the base.

ALAMMIELECH, in Scripture geography, a city in the tribe of Asher.

ALAMODALITY OF WRITING, alamodalitas scribendi, are modern Gallicisms by which some writers would express the endeavours of learned men to adapt the productions of their minds, to the genius or taste of the times, in order to render them more acceptable to the readers. A German writer, Geamoenus, has a dissertation on alamodality in writing,

ALAMODE, in commerce, a thin glossy black silk, chiefly used for women's hoods and men's mourning scarfs.

ALAMOS, (Balthasar,) a Spanish writer, born at Medina del Campo in Castile. After having studied the law at Salamanca, he entered into the service of Anthony Perez, secretary of state under Philip II. He was in high esteem and confidence with his master, upon which account he was imprisoned after the disgrace of this minister and kept in confinement eleven years, until Philip III. coming to the throne, set him at liberty. Alamos continued in a private capacity, till the duke of Olivarez, the favourite of Philip IV. called him to public employments. He was a man of wit as well as judgment; and his Spanish translation of Tacitus gained him great reputation. This work was published at Madrid in 1614; and was to have been followed with a Commentary, which, however, never appeared. The author composed the whole during his imprisonment. He died in the eighty-eighth year of his age.

ALAMOTH, in ancient Hebrew music, a word

used in the superscription to the forty-sixth Psalm, and supposed to have been the name of some Hebrew melody, according to which the Psalm was intended to be sung. As it partly signifies a sheaf of corn, the air might be one used in harvest.

ALAN, a river of Cornwall, sometimes called Camel and Camlan, a corruption of Camb-alan, 'the crooked river.' Leland calls it Dunmere, i. e. the water of the Hills. It rises about two miles north of the borough of Camelford, where its banks are famous for two battles; in one of which king Arthur, it is said, was slain, having slain his antagonist; the other in which many thousands fell, was fought between the Cornish Britons and the west Saxons of Devonshire, in 824. After a course of about twelve miles in a winding southern direction, the Alan at Parbrook becomes navigable for barges, and receives the river Lane, or Lynder. It afterwards becomes increased by several smaller rivers; and pursuing its course, empties its united streams into Padstow harbour, in the Bristol channel. At Padstow it is nearly a mile broad. This river produces some very fine trout.

ALAN, or **ALLEN**, (Cardinal William,) was born at Rassal in Lancashire, in the year 1532, and went to Oxford at the age of fifteen. In 1550, he was elected fellow of Oriel college.—In 1556, being then only twenty-three years old, he was chosen principal of St. Mary's-hall, and one of the proctors of the university. In 1548, he was made canon of York; but upon queen Elizabeth's accession to the throne, he left England, and settled at Louvain in an English college, of which he became the chief support and ornament. He visited his native country in 1565; but on account of his extreme activity in the propagation of the Roman Catholic religion, was obliged to quit it finally in 1568.—He went first to Mechlin, and then to Douay, where he received his diploma. Soon after he was appointed canon of Cambrai and then canon of Rheims. He was created cardinal in July 1587, and obtained from the king of Spain a rich abbey in the kingdom of Naples, and afterwards the bishopric of Mechlin. It is supposed to have been by the advice and instigation of cardinal Alan that Philip II. attempted to invade England. The cardinal furnished him, we are told, with numerous copies of a polemical treatise, (A declaration of the sentence of Sextus V. &c.) to prove queen Elizabeth a heretic and schismatic, whom her subjects were bound to depose. He died on the 20th of October, 1594, aged sixty-three: and was buried in the English college at Rome. Allan was a man of considerable learning, and an elegant writer.—His works, in defence of the Romish religion, were perhaps the most powerful of the Romish treatises in his day. The most remarkable are, 1. A Defence of the Twelve Martyrs in one year, (which Thomas Alfield was hanged for bringing into England, in the year 1584.) 2. Of the Worship due to Saints and their Relics, 1583.—3. A True and Modest Defence of Christian Catholics. The learned Edmund Bolton calls it 'a princely, grave, and flourishing piece of natural and exquisite English.' This treatise was answered

by lord Burleigh, who esteemed it the most elegant of the cardinal's writings. Dr. Southey says, that cardinal Alan 'was the person of all others whom the English Catholics,' at the period of the threatened Spanish invasion, 'regarded with most respect:' that he solicited Philip of Spain to employ an English Catholic regiment, as well as to confide the management of his fleet to English sailors, on that memorable occasion; and that when 'he spoke of this in after years he used to weep with bitterness, remembering how fatally for the Romish cause his advice had been rejected.' Book of the Church, vol. ii. 293-4. Mr. Butler, in his defence of the Catholics of this period, does not attempt to repel this statement. It appears certain that Alan was amongst the sincerest and most bitter, as well as one of the most learned bigots, that ever lived; but much of his conduct is to be attributed to the unhappy and illiberal spirit of his age. It is said that in later life he expressed regret at having taken so active a part against his country; and that letters of his are extant, advising a reconciliation of catholics with the protestant government, on the ground of a simple toleration.

ALANA-GIEBA, in botany, the yellowish white tripoli.

ALANA-TERRA, English oker: it is esteemed drying and astringent; its principal use is to mix with salts in distillation, in order to keep them from melting. It is thought that this stone is what the ancients called the Samian stone, 'Samius lapis.'

ALANBY, an agreeable watering place in Cumberland, situated about twenty miles north of Whitehaven, as far south of Carlisle, and 308 from London. There is a good anchorage in the bay, and an extensive herring fishery is carried on here.

ALANCHE, or **ALLANCHES**, a town of France, in Auvergne, formerly in the intendancy of Riom, and election of St. Flour, now the head of a canton, in the department of the Cantal, arrondissement of Murat. It contains 2500 inhabitants. Fine lace is manufactured here, and there are good tanneries. It is four leagues W. S. W. of Mercoeur.

ALAND. On Land. See **LAND**.
Her ost was cýpher in ys syde alonde býleued by poute.

R. Gloucester, p. 307.
Thei sailen, till thei come a lone
At Tharse nýgh to the citee.

Gower. Con. A. b. viii.
Dep seith he wol for do. and a down bryngē
All pat lývē opr lokep, a lone and a watere.

The Vision of Piers Ploughman, p. 340.

He only, with the prince his cousin, were cast a land, far oft from the place whither their desires would have guided them. Sidney.

ALAND, or **AELAND**, a considerable island of the Baltic, in N. lat. 60°. 18'. E. lon. 19°. 40'. It is about forty miles in length, and thirty in breadth, and being deeply indented by the sea, is composed of several peninsulas. It contains eight parishes, and a population of 11,300 persons. The soil is very fertile, producing corn, and abundance of forest woods, from which the natives manufacture excellent wooden utensils. There are nearly 4000 acres of land, in a high state of cultivation here; and 2500 barrels of

wheat are said to be produced annually. It is an island remarkable for the longevity of the inhabitants, and yielded the king of Sweden, some years since, a revenue of 19,980 rix dollars. The chief town is Castleholm, and the island itself gives name to a cluster of inferior islets. The inhabitants generally speak the Swedish language. In 1634 it was included in the government of Finland; but has recently been ceded to Russia. The channel between Aland and the Swedish coast, is that which is reckoned most safe in making for the gulf of Bothnia.

ALAND'S BAY, on the south coast of Ireland, between Waterford harbour and Tramore bay.—N. lat. 52°. 8'. W. lon. 7°. 5'.

ALAND, (Sir John Fortescue,) lord Fortescue of Ireland, was the son of Edmund Fortescue, esquire, of London, by Sarah, daughter of Henry Aland, esquire, of Waterford, whose name he assumed. He was born in 1670, and received his education at Oxford, from whence he removed to the Inner Temple, where he was chosen reader, and called to the bar. In 1714, he became solicitor-general to the Prince of Wales, and next year to the king. In the following year he was made one of the barons of the exchequer. In 1717, he removed to the court of king's bench, and in 1728, to the common pleas, which situation he resigned in 1746, on being created a peer, shortly after which he died. He published, in 1714, 8vo., Sir John Fortescue's Treatise on Absolute and Limited Monarchy; and was himself a sound lawyer, and a proficient in the Saxon literature. After his death, his Reports were printed in folio. This judge was remarkable for a flat nose; and a serjeant who had lost an arm, one day arguing a case in an awkward manner, the judge told him, that 'he appeared to handle the matter rather lameley;' to which the other replied, 'with submission, I trust to be able to make the case as plain as the nose in your lordship's face.' Lord Fortescue was very intimate with Pope, and furnished him with the legal burlesque of Stradling versus Styles.

ALANGI, SANTIAGO DE, a small but rich city of South America, in the province of Terra Firma. It supplies Panama with cattle and fruit.

ALANGUERA, a town of Portugal, in Estremadura, near the Tagus, and between Lisbon and Leiria. It is supposed to have been built by the Alani; its present name intends, (Alen-kir-kana) the temple of the Alans.

ALANI, in ancient geography, a mountain of Scythia, on one side of Irraus, and east of the Hyperborean mountains.

ALANI, or **ALANS**, a people of Tartar origin, who first settled on the banks of the Jaick, near the districts of Solemskoi and Cufa. They afterwards migrated into the plains northward of Circassia, but in A. D. 130, advanced to the Danube, and in A. D. 406, to the Rhine. Here they united themselves with the Vandals, and traversing Gaul, attacked the Goths and Franks in Spain, but were repulsed, and settled among the Pyrenees. Ammianus says, they had no other houses than their military waggons, though they were followed by large flocks and herds, and derived their principal subsistence from their

produce. A natural death was thought disgraceful to their men; their horses were caparisoned with the scalps of their enemies; and they worshipped a naked scimitar placed upright in the ground.

On the banks of the Tanais, says Mr. Gibbon, the military power of the Huns and the Alani encountered each other with equal valour, but with unequal success. The Huns prevailed; the king of the Alani was killed; and the remains of the vanquished nation were dispersed by the ordinary alternative of flight or submission. A colony of exiles found a secure refuge in the mountains of Caucasus, between the Euxine and the Caspian, where they long preserved their name and independence. Another colony advanced with intrepid courage, towards the shores of the Baltic; associated themselves with the northern tribes of Germany, and shared the spoil of the Roman provinces of Gaul and Spain. But the greatest part of the nation of the Alani embraced the offers of an honourable and advantageous union; and the Huns, who esteemed the valour of their less fortunate enemies, proceeded with an increase of numbers and confidence, to invade the limits of the Gothic empire. The name of the Alani was finally lost in that of the Goths and Huns.—*Ammanius, xxxi. 2. De Guignes Hist. des Huns, ii. Gibbon's Decline and Fall of the Roman Empire, vol. iv. p. 373.*

ALANIEH, a town of Asiatic Turkey, occupying the site of the ancient Coracesium, a city of Cilicia, near the mouth of a river flowing into the Mediterranean. In this port pirates were shut up by Pompey and compelled to surrender. It is 110 miles S. S. W. of Konieh. Lon. 21°. 29'. E. lat. 36°. 34'. N.

ALANORAVIUS, from the Gothic, *alan*, a greyhound, in our ancient customs, a keeper of or manager of spaniels, or setting dogs, for hunting, hawking, &c.

ALAPI, in ornithology, a species of the turdus, and the white-backed thrush of Latham. Its specific characters are, the colour above olive-brown, the throat and breast black, the abdomen cinerous, and the tail wedge-shaped and blackish. Its legs are yellowish, the wings above cinerous brown, and superior coverts spotted with white; the male has a white spot on the middle of the back; the female none, but its chin is white, the rest of the under-part of the body and the points of the coverts of the wings rusty. Its length is six inches; it feeds on ants; seldom flies for any time, though very agile, and is found in the thick woods of Guiana.

ALAPOULI, in natural history, the name of an East Indian tree, a species of the bilimbi, which is used in medicine, as a purge and vomit, mixed with the seeds of mustard.

ALAQUECA, in mineralogy, a medicinal stone brought from the Indies, in small glossy fragments; much praised by some for its efficacy in haemorrhages.

ALARAF, in the Mahomedan theology, the partition wall that separates heaven from hell. The word is plural, and properly written al araf; in the singular it is al araf, derived from the Arabic verb arafa, to distinguish. Al araf gives the

denomination to the seventh chapter of the *Koran*, wherein mention is made of this wall.—Mahomet seems to have copied his al araf, either from the great gulf of separation mentioned in the New Testament, or from those Jewish writers, who speak of a thin wall dividing heaven from hell. Mahomedan writers differ extremely as to the persons who are to be found on al araf. Some take it for a sort of limbus for the patriarchs, prophets, &c. others place here such whose good and evil works so exactly balance each other, that they deserve neither reward nor punishment; while a third opinion is, that this intermediate space is possessed by those who, going to war without their parents' leave, and suffering martyrdom, are excluded paradise for their disobedience, yet escape hell because they are martyrs. See *Sale's Koran*, preface, &c.

ALARBES, an Arabian name for those who live in tents, as distinguished from others who live in towns.

ALARCON, a small town of Spain, in New Castile, near the Xucar, founded in 1178, and afterwards entirely destroyed by the Moors, but rebuilt by Alphonso IX.

ALARES, in antiquity are supposed by some authors to have been a kind of militia, or soldiers among the Romans; so called from ala, a wing, because of their lightness and swiftness in the combat. Others make them a people of Pannonia; but others with more probability, take alares for an adjective or epithet, and apply it to the Roman cavalry; because placed in two wings, or alae, of the army; for which reason, a body of horse was called ala.

ALARES MUSCULI, in anatomy. See PTERYGOLEIUS.

ALARGED'. See ENLARGE.

A ghe corynthis, oure mouth is open to ghou oure herte is *alargid* ghe ben not angwischid in us, but ghe ben angwischid in ghoure ynwarrness and I seie as to sones, ghe that han the same reward, be ghe *alargid*. *Wiclid. 2 Corinth. vi.*

ALARIC, a famous general of the Goths, was descended from a noble family, and for some years served in the Roman armies; but being refused preferment, he revolted, and committed great ravages in the Grecian provinces. He entered Thrace at the head of 200,000 men, and laid waste all the country through which he passed. He marched next into Macedonia and Thessaly, A. D. 396; where the Thessalians met him near the mouth of the river Peneas, and killed about 3000 of his army; nevertheless he advanced into Greece, and having ravaged the whole country, returned to Epirus, loaded with immense spoils. After staying here five years, he resolved to turn his arms to the west. He marched through Pannonia; and finding little resistance, entered Italy, under the consulship of Stilicho and Aurelinus, A. D. 400.—After various battles and treaties, he at last took Rome by treachery, and permitted his soldiers to plunder it, A. D. 409. Alaric having laid waste a great part of Italy, intended to pass into Sicily; but a storm obliging him to land again, he besieged the city of Consentia; and having taken it, died there in 411, eleven years after he first entered Italy. He was buried in the bed of

the small river Busentinus, which washed the walls of Consentia, and which for this purpose was diverted from its course and then restored ; the place of his interment was further concealed by the massacre of the prisoners who had been employed in the work. Alaric, whatever may be alleged respecting the conduct of his followers, was himself not devoid of humanity, and exhibited more moderation and fidelity to his engagements than many of the modern class of conquerors. ‘He was,’ says Dr Lardner, ‘a Goth, and therefore was called a barbarian ; but he was a man of a great and generous mind, and a Christian of the Arian denomination. When Rome was sacked and plundered, the calamity was attended with some favourable circumstances, resulting from the generosity of Alaric, and his profession as a Christian. By ordering the lives of men to be spared as much as possible, and the churches to be respected, many Christians and Pagans were preserved. Although, ‘adds this candid writer,’ the taking of Rome by Alaric was the occasion of many reflections upon the Christians, from which they have been vindicated both by Augustine and Orosius, the event was very prejudicial to the interests of Gentilism, and consequently conducive to the progress of the Christian religion.’ See *Lardner’s Works*, vol. ix. 180.

ALARIS VENA, in anatomy, the inmost of the three veins in the bend of the arm.

ALARM, *v. & n.* From the Italian, *all’ Alar’ing*, *armé*. To the arms ; to **ALARM’ING**, *arms* ; to sound to arms ; **ALARM’IST**, *to announce danger* ; to **ALAR’UM**, *v. & n.* disquiet. Alarum, a corruption of alarm.

Turnus sluggish sloth doth stay, but force with speed
he bends,
Gainst Trojans all his power, and on the shore a-
front them tends.

They blow *alarme*, *Aeneidos*, b. x. by *Thos. Phacr.*
When the congregation is to be gathered together,
you shall blow ; but you shall not sound an *alarm*.

Numbers.
God himself is with us, for our captain ; and his
priests with sounding trumpets, to cry *alarm* against
you. *Chron. xiii. 12.*

Withered murder
(*Alarum’d* by his sentinel the wolf,
Whose howl’s his watch) thus, with his stealthy pace,
Moves like a ghost. *Shakespeare.*

That Almato might better hear,
She sets a drum at either ear ;
And loud and gentle, harsh or sweet,
Are but tl. *alarums*, which they beat. *Prior.*

Crowds of rivals, for thy mother’s charms,
Thy palace fill with insults and *alarms*. *Pope’s Odyssey.*

The trumpet’s loud clangour,
Excites us to arms,
With shrill notes of anger,
And mortal *alarms*. *Dryden.*

Taught by this stroke, renounce the war’s *alarms*,
And learn to tremble, at the name of arms. *Pope’s Iliad.*

When rage misguides me, or when fear *alarms*,
When pain distresses, or when pleasure charms. *Tickell.*

Man sleeps, and man alone, and man whose fate,
Fate irreversible, entire, extreme,
Vol. I.

Endless, hair hung, breeze shaken, o’er the gulf
A moment trembles ; drops ! and man for whom
All else is in *alarm* ; man, the sole cause
Of this surrounding storm ! and yet he sleeps
As the storm rocked to rest. • *Young.*

It is not without reason that the Apostle represents our passage through this stage of our existence, by images drawn from the *alarm* and solicitude of a military life ; for we are placed in such a state that almost every thing about us conspires against our chief interests. *Rambler.*

ALARM, in fencing, denotes a step, or stamp, made on the ground with the advancing foot.—It is otherwise called an *appel*, or challenge.

ALARM, or rather **ALARUM**, is also used for an instrument to awaken persons at a certain hour ; one very simple contrivance of this kind, is that used by weavers. See *WEAVER’S ALARM*.

ALARM, in military affairs, any notice given either by the beat of the drum or the firing of cannon, &c. which shall cause the men to run to their arms.—**ALARM POST**, in the field, is the spot fixed upon by the quarter-master-general for each regiment to march to in case of an alarm : in the garrison, a similar place is marked out by the governor.—**ALARM-BELL**, a bell which is used for the purpose of ringing an alarm, as in case of fire, mutiny, &c. ; called by the French a *tocsin*.—**FALSE ALARMS**, are stratagems of war, which are employed either by an enemy for the purpose of harassing, or by command for the purpose of trying the vigilance of the men.

ALAS’, inter. French, *hclas*. Ital. *ahilasso* ; **ALLACE’**, **ALLAKE’**, **ALACK’**. } an exclamation expressing sorrow, lamentation, woe.

He loked on her vgly leper’s face,
The whiche before was white as loly flour,
Wringing his hands, oft times saied *alace*
That he had luod to see that wofull hour.

Chaucer. Complaint of Crescide, fol. 196.

Allace, allace!
I leis my fader, al comfort and solace

And al supple of our trauel and pane,
Thare, thare *allake*. *Douglas*, b. iii. p 93.

Alas, my father there, my only ioy in care and wo,
Auchises I do lose (*alas*) he there deports me fro.

Aeneidos, b. iii. by *Thos. Phacr.*

Alacke, the olde prouerbes bee to true : an ape
although she be clothed in purple, will be but an ape,

Hall, p. 119.

But yet, *alas* ! O but yet, *alas* ! our haps be but
hard haps. *Sidney.*

Alas, how little from the grave we claim !
Thou but preserv’st a form, and I a name. *Pope.*

ISAB. *Alas, alas !*
Why all the souls that were, were forfeit once,
And he that might the vantage best have took,
Found out the remedy.

Shakespeare’s Measure for Measure.
YORK. Yet looks he like a king : behold his eye,
As bright as is the eagle’s, lightens forth
Controlling majesty, *alack*, for woe,
That any harm should stain so fair a show.

Shakespeare’s K. Richard II.
Alack, when once our grace we have forgot,
Nothing goes right ; we would, and we would not.

Shaksp. Measure for Measure.
At thunder now no more I start,
Than at the rumbling of a cart :
2 F

Nay (what's incredible) *alack,*
I hardly hear a woman's clack. *Swift.*
Alas! for pity of this bloody field;
Piteous indeed must be: when I, a spirit,
Can have so soft a sense of human woes.

Dryden.
ALASCANI, in church history, a name that has been sometimes given to the friends of John Alasco. See next Article.

ALASCO, (John,) a Polish prince of the sixteenth century, who, imbibing the reformed opinions, was expelled his country. He was the uncle of king Sigismund of Poland; was born in 1499, and having received an education suited to his birth, travelled into foreign countries; when being at Basil in 1525, he contracted a friendship with Erasmus, which lasted to the death of that great man. In Switzerland, he also formed an acquaintance with Zwinglius, which occasioned his conversion to the protestant faith. In 1526, he returned to Poland, and was nominated to the bishopric of Vesprim in Hungary, but his new principles obliged him to decline that station. In 1540, he quitted that country, and two years afterwards undertook the pastoral office at Embden; but foreseeing persecution there, came to England about the year 1551, while the reformation was carrying on under Edward VI. The publication of the Interim driving the protestants to such places as afforded them toleration, a considerable congregation arrived at the same time with Alasco, who through the liberal patronage of Archbishop Cranmer, were naturalized here, and obtained a charter of incorporation, independent of the church of England. The Augustine friars church was granted them, with revenues for the maintenance of Alasco as superintendent, and four assistant ministers, who were to be approved by the king. This congregation lived undisturbed until the accession of Queen Mary, when they were all sent away. They were kindly received and permitted to settle at Embden; and Alasco at last, after an absence of twenty years, by the favour of Sigismund, returned to his own country, where he died in 1560. He was much esteemed by Erasmus, who says of him, 'that which the young ought to learn of the aged, I, an old man, have learned of this youth;' he was also the intimate friend of Melanthon. The historians of his time speak greatly in his praise: we have of his writings, *De Cena Domini Liber*; *Epistola continens summam Controversiae de Cena Domini, &c.* He had some particular tenets respecting the presence of Christ in the Lord's Supper.

ALASTROB, among alchemists, denotes lead; though some suppose it to signify calx,

ALATAMAHÀ, a noble river of Georgia, North America, which rises in the Cherokee mountains, and in its descent receives several auxiliary streams. After winding with considerable rapidity through a hilly country 250 miles, it throws itself upon the open plains, by the name of Oakmulgee, for 150 miles, and is joined by the Oconee, which likewise has its source in these mountains. After this junction, it assumes the name of Alatamaha, and becomes a majestic river, flowing with a gentle current through forests and plains 100 miles, until it discharges

itself into the Atlantic by several mouths. A northern channel glides by the heights of Darien, about ten miles above the bar, and after several turnings enters the ocean between Sapelo and Wolf islands. The south channel, which is the largest and deepest, after its separation from the north, descends gently between M'Intosh and Broughton islands; and at last, by the west coast of St. Simon's Sound, between the south end of the island of that name and the north end of Jekyl island, accomplishes its confluence with the Atlantic, where it is 500 yards across.

ALATE'. See LATE.

I saw standyng the goodly portress,
Whyche axed me from whence I came *alate.*

Hawes. *Tower of Doctrine, c. 4.*

Where chilling frost *alate* did nip,

There flasheth now a fire;

Where deep disdain bred noisome hate,

There kindleth now desire.

Greene. *Dittie of Dorallacia.*

ALATED LEAVES, among botanists, those made up of several pinnated ones, as the orobus. See LEAF.

ALATERNOIDES, a name given by botanists to the cassine.

ALATERNUS, in botany, the trivial name of a species of the rhamnus. See RHAMNUS.

ALATRI, an old town of Italy, seated on a hill, in the Campagna di Roma, forty miles south-east of Rome, and six miles north-west of Veroli. It has a bishop's see. Lon. 13°. 9'. Lat. 41°. 32' N.

ALATUNGA, in ichthyology, a species of the scomber, having the first pectoral fins very long, and seven small fins on each side of the tail. It is found periodically gregarious in the Mediterranean.

ALATYR, a provincial town and district of Asiatic Russia, seated on the river Saru, in the circle of Alatyrskoi, and nine miles west of Simburk, from the capital of which it is distant about 100 miles. The houses of the town are all of wood; but here are five churches, besides a convent.

ALAVA, a district of Spain, twenty miles in length and seventeen in breadth, called also ALABA, which see: Victoria is the capital.

ALAUDA, in entomology, a species of Curculio; cinereous, sub-globose thorax, back marked with a transverse band and black spots, and brown legs: found in Pomerania.

ALAUDA, in ichthyology. See BLENNIUS.

ALAUDA, or LARK, in ornithology, a genus of birds of the order of passeres; the characters of which are these: the beak is cylindrical, subulated, straight; and the two mandibles or chaps are of equal size. The tongue is bifid, and the hinder claw is straight, and longer than the toe. There are twenty-eight species of the alauda, of which the following are the most remarkable.

1. ALAUDA ALPESTRIS, the chief wing-feathers are half white, the throat yellow, and it has a black streak under the eyes and on the breast. It inhabits North America, where it is migratory. It visits Albany the beginning of May, but goes farther north to breed. In winter it comes in vast flocks into Virginia and Carolina. It feeds during its stay in the more southern parts on oats and other grain; and while at Albany, on the grass and sprig-birch. It runs

into holes; whence the natives of these last parts have given it the name of chi-chup-pi-sue. The English call it the ortolan, and reckon it delicious eating. By some it is called snow-bird, as being very plentiful in that season. It is always seen on the ground and has little or no song. This bird we hear of in Germany also; and it abounds throughout Russia and Siberia.

2. *ALAUDA ARBOREA*, or wood-lark, a native of Europe, and distinguished by an annular white fillet about the head. It is inferior in size to the sky-lark, and is of a shorter, thicker form; the colours are paler, and its notes less sonorous and varied, though not less sweet. It perches on trees, and whistles like the black-bird. It will sing in the night; and, like the common lark, sings as it flies. It builds on the ground, and makes its nest on the outside with moss, within of dried bents lined with a few hairs. The males of this and of the pratensis are known from the females by their superior size. But this species is not numerous.

3. *ALAUDA ARVENTIS*, or common sky-lark. This and the wood-lark are the only birds that are known to sing as they fly; this raising its note as it soars, and lowering it till it quite dies away as it descends. It will often soar to such a height, that we are charmed with the music when we lose sight of the songster; it also begins its song before the earliest dawn. Milton, in his *Allegro*, most beautifully calls upon us

‘To hear the lark begin his flight,
And singing startle the dull night,
From his watch-tower in the skies,
Till the dapple dawn doth rise.’

And bishop Newton observes, that the scene of rural cheerfulness thus exhibited, not only gives us a fine picture of the poet’s regularity of life, but of the innocence of his mind. It continues its harmony several months, beginning early in the spring, on pairing. In the winter they assemble, in vast flocks, grow very fat, and are taken in great numbers. They build their nest on the ground, beneath some clod, forming it of hay, dry fibres, &c. and lay four or five eggs. They are taken in great quantity, in the neighbourhood of Dunstable; the season begins about the twelfth of September, and ends the twenty-fifth of February. Vastly greater numbers, however, are at times caught in different parts of Germany, where there is an excise upon them. Keyster says, that the excise in his time produced 6000 dollars (about £1400 sterling) every year to the city of Leipsic. They are also taken in great numbers in the country about Naumburg, Merseburg, and Halle.

4. *ALAUDA CAMPESTRIS*, has one half of its chief feathers of the wing brown, except two in the middle which are white, and the throat and breast are yellowish.

5. *ALAUDA CRISTATA*, the chief tail-feathers are black, but the two outermost are edged with white, and the head is crested. It is a native of Europe. It sings well, like the sky-lark: lays four or five eggs; and is said to hatch twice in a year.

6. *ALAUDA MAGNA*, the great lark, is yellow on the belly, with a crooked black streak on the breast, and the three side-feathers of the tail white. It is a native of Africa and America.

7. *ALAUDA PRATENSIS*, or tit-lark, has the two outward feathers of the wing edged with white, and frequents the meadows. It is found frequently in low marshy grounds: like other larks, it builds its nest among the grass, and lays five or six eggs. Like the wood-lark, it sits on trees; and has a most remarkably fine note, singing in all situations, on trees, on the ground, while it is sporting in the air, and particularly in its descent. This bird, with many others, such as the thrush, black-bird, willow-wren, &c. become silent about midsummer, and resume their notes in September: hence the interval is the most mute of the year’s three vocal seasons, spring, summer, and autumn. Perhaps the birds are induced to sing again as the autumnal temperature resembles the vernal.

8. *ALAUDA SPINOLETTA*, the chief tail-feathers are black, only the outermost two are obliquely half white. It is a native of Italy.

9. *ALAUDA TRIVIALIS*, whose chief feathers on the tail are brown, only half of the outermost is white at the end, in the shape of a wedge; there is likewise a double whitish line on the wings. It is a native of Sweden, and perches on the tops of trees.

10. *ALAUDA ZEELANDIÆ*, the New Zealand lark, is seven and a half inches in length: the bill is half an inch, of a pale ash-colour, with the upper part black: the upper parts of the body are dusky, edged with pale ash-colour: the breast and belly are white; the legs reddish ash-colour, and the claws black. It inhabits Charlotte Sound, and is called kogoo arcoure.

ALAUNA, the ancient name of Alnwick in Northumberland. See *ALNWICK*.

ALAUSI, a district of the kingdom of Quito, South America, bounded on the north by the province of Riobamba, north-west by Chimbo, south by Cuenca, west by the district of Yaguache, and east by that of Macas. It is mountainous, but the country is pleasant, and yields every kind of American fruit and grain. The capital has flourishing manufactures of cloths, baizes, and cotton garments, a good parish church, and a convent of the order of St. Francis. It stands in Lon. 78°. 39'. W. Lat. 2°. 12'. N.

ALAUSI, a river of South America, which has its rise in the desert of Assuay, in the kingdom of Quito, and flowing down the western side of the Cordilleras, discharges itself into the bay of Guayaquil.

ALAY, in Turkish customs, a kind of military triumph at the opening of a war. It is an exhibition of the most insipid buffoonery, and barbarity. That which took place upon occasion of a late war between the Porte and Russia is described by Baron Tott in his *Memoirs* as follows: ‘It consists in a kind of masquerade, in which each tribe successively presents to the spectators the mechanical exercise of its respective art. The labourer draws his plough, the weaver handles his shuttle, the joiner his plane; and these different characters, seated in cars richly ornamented, commence the procession and precede the standard of Mahomet, when it is brought out of the seraglio to be carried to the army, in order to ensure victory to the Ottoman troops. This banner of the Turks, which

they name Sandjack Sheriff, or the Standard of the Prophet, is so revered among them, that, notwithstanding its reputation has been so often tarnished, it still retains their implicit confidence, and is the sacred signal to which they rally. Every thing proclaims its sanctity. None but the emirs are allowed to touch it; they are its guards, and it is carried by their chief. The Mussulmen alone are permitted to look upon it. If touched by other hands, it would be defiled; if seen by other eyes, profaned. In short, it is encompassed by the most barbarous fanaticism. A long peace had unfortunately caused the ridiculousness, and especially the danger, of this ceremony to be forgotten. The Christians imprudently crowded to see it; and the Turks, who, by the situation of the houses, could make money of their windows, began to profit by the advantage; when an emir, who preceded the banner, proclaimed with a loud voice, ‘Let no infidel dare to profane with his presence the holy standard of the prophet; and let every Mussulman who perceives an unbeliever make it known under pain of reprobation. From that moment no asylum was to be found; even those became informers, who, by letting out their houses, had rendered themselves accomplices in the crime. A religious fury seized on every mind and put arms in every hand; the more atrocious the cruelty, the more was it meritorious. No regard was paid to sex or age; pregnant women, dragged by the hair, and trodden under feet by the multitude, perished in the most deplorable manner. Nothing was respected by these monsters; and under such auspices the Turks commenced the war.’

ALAY, among sportsmen, a term borrowed perhaps from the above ceremony, to express fresh dogs sent into the cry.

ALB, or  Lat. *albus*, white. The priest's

ALBE, n. § vestment in the Catholic church, answering to the surplice of the English church, excepting that the alb is made close at the wrists.

Of prestē pow has no merke, *albe* ne now amite
Bot laced in a hauberke, *pai* is no clerk is abit.

R. Brune, p. 319.

And Moses brought Aaron and hys sonnes, and wasshed them with water, and put upon him an *albe*, and girded him wt a girdle. *Bible*, 1539. *Lev.* viii.

Each priest adorned was in a surplice white;

The bishops donn'd their *albs* and copes of state.

Fairfax. *Tasso*. ii. 4.

ALB, from *albus*, white, in ecclesiastical history, a white vestment usually worn for eight days, in the ancient churches, by the newly baptized. The Sunday after Easter was called Dominica in *albis*, on account of the albs worn by the Neophytes, who were baptized on Easter-day.

Romish priests.

ALB is also a name of a Turkish coin, otherwise called asper. See ASPER.

ALBA, an ancient town of the Marsi in Italy, on the north side of the Lacus Fucinus, which still retains its original name. It stands upon an eminence, and is noted in Roman history for being the state prison to which captive princes were committed, after being dragged through the streets of Rome at the chariot wheels of a

triumphant consul. Perseus king of Macedon terminated his wretched career in this confinement, with his son, the last hope of an illustrious line of kings. Syphax the Numidian, and Bituinus king of the Averni, were also condemned to this gaol by the particular clemency of the senate; which sometimes indulged its savage disposition by putting its captives to death. Alba being situated in the centre of Italy, amidst difficult mountainous passes, and far from all means of escape, was considered a proper place for the custody of prisoners of importance. Artificial strength was added to its natural security, and traces of its solid fortifications remain to this day. For the entertainment of the garrison, an amphitheatre was erected, and Lucius Vitellius, brother to the emperor of that name, had a villa in the neighbourhood, famous for the variety and excellence of its fruit-trees. His gardens were the nurseries where several of the most delicious stone-fruits, that are now so common in Europe, were first cultivated and multiplied.

ALBA, a fortified town of Upper Italy, in Piedmont, situated on the river Tanaro, nineteen miles south-east of Turin. Anciently it was a principal city of Old Liguria. It is now the see of a bishop, and contains, besides the cathedral, three parish churches, and seven convents. Population about 9000.

ALBA LONGA, in ancient geography, a city of Latium, in Italy, built by Ascanius, after Lavinium had stood thirty years, on the Mons Albanus (afterwards so called from the city); and on the spot where a white sow was found, as foretold to Aeneas. *Virg. Aen.* i. viii. v. 43, and 83. *Aurel. Vict.* c. 19. *Livy*, i. i. c. 3. only says, that the population of Lavinium becoming too great for it, Ascanius founded Alba Longa, and removed the people thither. The city continued to be the capital of the kingdom for three centuries, but Rome eclipsed its glory, and Tullus Hostilius destroyed it entirely, B.C. 666, and transferred its inhabitants to Rome. *Livy* i. i. c. 29. But the temple, which was in a grove on the mountain, and in which Jupiter was worshipped, was spared. *Strabo*, l. v. *Cicero. Orat. pro Milone*, c. 31. The Mons Albanus, in later ages, became celebrated for the palaces and villas erected on it; among which was a very magnificent one belonging to Pompey. *Cicer. Ibid.* See ALBANUS.

ALBA POMPEIA, in ancient geography, a town of Liguria, on a small river called the Ceba. From the evidence of some inscriptions, it is supposed to have been a colony planted by Pompey, or to have been settled by Scipio, and restored by him. The Roman emperor, Pertinax, is said to have been born there; but Julius Capitolinus (*in vita*) assigns him a different birth-place. The town is now called ALBA, as above. *Plin. l. iii. c. 7. Ptolemy*, l. iii. c. 1.

ALBA JULIA, now WEISSENBURG, a town of Transylvania, on the river Marisius, or Merisch, to the west of Hermanstat, supposed to have been named after Julia Domna, the mother of Caracalla. There are, however, several inscriptions found at or near Weissenburg, which bear Col. Apul. that is, *Colonia Apulensis*, without

the least mention of Alba Julia, though inscribed after Caracalla's time. And Ulpian, reciting the colonies of Dacia, calls this colony Apulensis, but neither Alba nor Julia. From all which there is a suspicion that Alba Julia is a corruption of Apulum. It was also called Apulum Augustum. Long. 25°. 0'. E. Lat. 46°. 46'. N.

ALBACETE, anciently called Cetide, a small but busy town of Spain, in the province of Murcia, about eighty miles from Valencia. There is a good trade here in wine, saffron, corn, and oil. Its fair, or market, held in September, has long been famous for cattle.

ALBAN, ST. a celebrated saint and martyr of the third century, who is said to have been the first person who suffered martyrdom for Christianity in Britain; and is therefore usually styled the proto-martyr of this island. He was born at Verulam, and in his youth took a journey to Rome, in company with Amphibalus a monk of Caerleon, and served seven years as a soldier under the emperor Dioclesian. At his return he settled in Verulam; and, through the example and instructions of Amphibalus, renounced the errors of paganism, in which he had been educated, and became a convert to the Christian religion. It is generally agreed that Alban suffered martyrdom during the great persecution under Dioclesian; but authors differ as to the year when it happened: Bede and others fix it in 286; some refer it to the year 296; but Usher places it in 303. His martyrdom, according to Bede, happened thus:—Being as yet not known to be a Christian, he entertained Amphibalus in his house; of which the Roman governor being informed, sent a party to apprehend Amphibalus; but Alban, putting on the habit of his guest, presented himself in his stead, and was carried before that magistrate. The governor having asked him of what family he was! Alban replied; ‘To what purpose do you enquire of my family? if you would know my religion, I am a Christian.’ Then being asked his name, he answered, ‘My name is Alban; and I worship the only true and living God, who created all things.’ The magistrate replied, ‘If you would enjoy the happiness of eternal life, delay not to sacrifice to the great gods.’ Alban answered, ‘The sacrifices you offer are made to devils; neither can they help the needy, or grant the petitions of their votaries.’ His behaviour so enraged the governor, that he ordered him immediately to be beheaded. In his way to execution, he was stopped by a river, over which was a bridge so thronged with spectators that it was impossible to cross it; the saint, as we are told, lifted up his eyes to heaven, when the stream was miraculously divided, and afforded a passage for himself and 1000 more persons. Bede does not indeed give us the name of this river; but the omission, we suppose, will not cause the miracle to be less believed. This wonderful event converted the executioner upon the spot, who threw away his drawn sword, and, falling at St. Alban’s feet, desired he might have the honour to die with him; which circumstance occasioned a delay in the execution till another person could be got to perform the office;

St. Alban therefore walked up to a neighbouring hill, where he prayed for water to quench his thirst, and a fountain sprang up under his feet! Here he was beheaded on the twenty-third of June. The executioner is said to have been a signal example of divine vengeance; for as soon as he gave the fatal stroke his eyes dropped out of his head. We conclude with the words and feelings of Milton in regard to this narrative; who, speaking of St. Alban, says, ‘The story of whose martyrdom, foiled and worse martyred with the fabling zeal of some idle fancies, more fond of miracles than apprehensive of the truth, deserves no longer digression.’—See ST. ALBAN’S.

Dr. Southey says, ‘Monkish writers have disfigured this story with many fictions in their wonted manner; but there is no room to question that the main facts are historical truths.’ *Book of the Church*, vol. i. p. 13.

ALBAN, ST. a considerable town of France, in the district of Gevaudan, in Languedoc, arrondissement of Marvejols. The inhabitants, who amount to 2100, are chiefly employed in the manufacture of woollen stufs. It is twenty-one miles west of Mende.

ALBANA, in ancient geography, a sea-port town of Albania, on the Caspian Sea, between the rivers Casius and Albanus; now called Baeliu, or Bathy, giving name to the Caspian Sea, viz. Mar de Bahu.

ALBANENSES, in church history, another name for the Albigenes, according to some writers. Those, who would distinguish them, attribute the same opinions to both; only making the Albanenses to have been prior in respect of time, being known to exist towards the close of the eighth century; whereas the Albigenes did not appear till the twelfth. See ALBIGENSES.

ALBANI, or ALBANO, (Francis) a celebrated painter, born at Bologna, in 1578. His father was a silk-mercer, and intended to bring up his son to that business; but Albani having a strong inclination to painting, when his father died, devoted himself entirely to that art, though then but twelve years of age. He first studied under Denys Calvert; and Guido Rheni being at the same time under this master, the pupils contracted a warm friendship. Calvert drew but one profile for Albani, and afterwards left him entirely to the care of Rheni; whom he followed to the school of the Caraches: but envy poisoned the intercourse of the young artists; when Rheni had set up a beautiful altar-piece, Albani would oppose to it some fine picture of his: and yet they spake of each other with the highest respect. Albani having greatly improved himself under the Caraches, went to Rome, where he continued many years, and married; but his wife dying, he returned, at the request of his relations, to Bologna. His second wife, Doralice, was well descended, though possessed of little fortune; and so beautiful, that Albani sought no other model for his finest representations of the sex. She brought him several fine children, who were also the originals of some of his best compositions. From them too, the famous sculptors, Flaman and Argaldi, modelled their Cupids. Albani's paintings, says Malvasia, breathe nothing but content and joy. He died in 1660. King

Charles I. invited him to England by a letter signed with his own hand.

ALBANI, in antiquity, a college of Salii, or priests of Mars, instituted by Tarquin, and denominated from mount Albanus, the place of their residence.

ALBANI, in writers of the middle age, denotes strangers or foreigners; answering to what we call aliens.

ALBANI, (Alexander,) a cardinal and virtuoso, was born at Urbino in 1692, being raised to the rank of cardinal by Innocent XIII. He died much esteemed in 1779. The villa Albani was famous for beautiful statues, paintings, &c. His late majesty in 1762, purchased for 14,000 crowns the collection of drawings, amounting to three hundred volumes, one-third of which were originals of the first masters, and the remainder most excellent engravings. This prelate was librarian to the Vatican, and author of some celebrated literary and political works.

ALBANI, (John Francis,) cardinal, nephew, and heir of the above, was also a patron of the fine arts. He increased the library of his uncle from twenty-five to thirty thousand volumes. In the year 1793 it was computed that the villa Albani contained nearly two hundred thousand works of art and specimens of antiquity, all of which were dispersed or carried away when the French entered Rome. They are accused of a great want of generosity in this instance. On

the election of Pius VII. cardinal Albani returned to Rome, but could never muster sufficient fortitude to visit his dilapidated villa. He died in 1803, with the character of being one of the most affable, and accomplished persons of the age. *Athenaeum*, vol. iii.

ALBANI, (Aloisia de Stolberg, countess of), wife of prince Charles Edward Lewis Stuart, commonly known by the name of the Pretender, is celebrated as the 'mia donna' of the Italian poet Alfieri. The life of this lady was throughout an unhappy one: in the possession of great beauty and accomplishments, she was united to a coarse, licentious, and intemperate husband early in life. His disgusting habits are confirmed by the accounts of his most devoted friends, and were in fact, the final cause of the extinction of his party in England. She was compelled at length to take refuge from his brutality in a convent, where she remained till his death in 1788. Her own took place at Florence, January 29, 1824, in her seventy-second year. *Gent. Mag.*

ALBANO, or **ALBANI**, (Giovanni Battista,) the brother and disciple of Francesco, was principally devoted to landscape painting, which he designed in exquisite taste; touching the trees with spirit, and giving them a great sweetness of colour. His general style, both in manner and colouring, resembled that of his brother. He died in 1668.

A L B A N I A.

ALBANIA, in ancient geography, a province of Asia, bounded by the Caucasian mountains on the north, the Caspian sea on the east, Armenia on the south, and Iberia on the west.—According to several ancient writers, its chief cities were Teleba, Thalbis, Gelda, Thiauna, Thabilaca, Albana, Chadaca, Misia, Boziata, and Cabalica, which last Pliny calls the metropolis. Its rivers were Cyrus or Cyrius, now Kur, Albanus, Cæsius, Gerrhus, Soana, Cambyses, and Alazon; which discharge themselves into the Caspian sea. This country is that now known by the names of Shirwan and East Georgia, and is extremely fertile and pleasant. The inhabitants have been represented as tall, robust, graceful, and comely in their persons; and simple in their manners.—Strabo, tom. 2. p. 767. Pliny says, they were of a white complexion, and could see as well by night as by day. *H. N.* tom. i. p. 371. They worshipped as gods the sun, Jupiter, and the moon. Tacitus, lib. 5, and Pliny, tom. i. p. 311. trace their origin to the Thessalians, who attended Jason in his expedition to Colchis, and settled in this part of the isthmus, between the Euxine and Caspian seas. Justin, lib. xiii. describes them as being descended from the inhabitants of Alba in Italy.—Ammianus Marcellinus derives them from the Massagetae. Strabo says, this country included no fewer than twenty-six kingdoms or principalities, speaking as many languages; but the Albani overcoming the other tribes, became masters of the whole, and established a regular succession of kings, of whom we read occasionally in history,

from the time of Alexander the Great. At the invasion of Pompey, they brought into the field 60,000 foot and 12,000 horse; and though Pompey was victorious, he was obliged to retire.

We have no account of any of their kings till the time of Alexander the Great, when the king of Albania is said to have presented that monarch with a dog of extraordinary size and swiftness. Pliny, tom. i. p. 465. Oreses the next king, was defeated by Pompey, and obliged to retire to Mount Caucasus. Phrasmenes, another king of Albania, committed great devastations in Armenia, Media, and Cappadocia, and was summoned by the emperor Adrian. This summons he refused to obey, but in lieu thereof sent a number of such great coats as were then worn, made of cloth of gold, in which the emperor, as an insult to the king, ordered 300 criminals to be clothed, and in that attire to fight the wild beasts in the public theatre. After the death of Adrian, he attended the summons of Antoninus Pius, on which occasion he was received with respect and courtesy. Two other kings of Albania are mentioned in history, one of whom was cotemporary with Valerian, and the other with Constantius, the son of Constantine the Great. The race of Albanian kings were continued down to the time of Justinian II. who is said by Zonaras and other writers, *Anc. Univ. Hist.* vol. ix. p. 122—126, to have subdued the country by his general Leontius.

ALBANIA, a city of Asia, in Assyria, occupying a site east of the river Titana.

ALBANIA, in modern geography, called by

the Turks, Arnaut, is a province which, though in fact nearly independent, nominally forms one of the provinces of the Turkish empire. It extends from the thirty-ninth to the forty-third degree of latitude, for the space of about 250 miles along the east of the Adriatic and Ionian seas.—The breadth inland nowhere exceeds one hundred miles, and in the southern part not more than thirty. It is bounded on the north by Dalmatia and Servia, and on the south by Livadia. Its eastern boundaries are not distinctly ascertained. The chain of Pindus, now the mountains of Sagori, Metzovo, and of Suli, separate it by an ill-defined line, from Macedonia and Thessaly. To use the language of a late publication, ‘Were a line drawn in the Suli mountains, from about the narrowest breadth from the sea above cited, and extended to the country of the Montenegrins, a distance of about 250 miles, where this province has its greatest breadth, it would complete as correct an outline of Albania, as in the present imperfect state of its geography our latest travellers will enable us to describe.’—Ioannina, the capital of a district of that name, eastward, would be about twenty miles to the south-east of this line, and here resided the enterprising Albanian chief, Ali Pasha, who lately commanded the entire resources of this interesting country. Albania thus comprehends in its widest sense the ancient Illyricum and Epirus, and is included by the Turks in the government of Romania.

The natural features and beauties of this country, together with its most striking topography are exhibited in the following beautiful lines from Lord Byron’s Childe Harold:

Land of Albania! where Iskander rose,
Theme of the young, and beacon of the wise,
And he his name-sake* whose oft baffled foes
Shrunk from his deeds of chivalrous emprise:
Land of Albania! let me bend mine eyes
On thee, thou rugged nurse of savage men!
The cross descends, thy minarets arise,
And the pale crescent sparkles in the glen,
Through many a cypress grove within each city’s ken.
Morn dawns, and with it stern Albania’s hills,
Dark Sulis’ rocks, and Pindus’ inland peak,
Rob’d half in mist, bedewed with snowy rills,
Arrayed in many a dun and purple streak,
Arise; and, as the clouds along them break,
Disclose the dwelling of the mountaineer;
Here roams the wolf, the eagle wets his beak,
Birds, beasts of prey, and wilder men appear,
And gathering storms around convulse the closing year.

Ambracia’s gulf behold, where once was lost!
A world for woman, lovely, harmless thing
In yonder ripling bay, their naval host
Did many a Roman chief and Asian king—
Look where the second Cæsar’s trophies rose!
To doubtful conflict, certain slaughter bring:
Now like the hands that rear’d them withering:
Imperial anarchs doubling human woes! [lose?]
God! was thy globe ordained for such to win and
From the dark barriers of that rugged clime,
Ev’n to the centre of Illyria’s vales,
Childe Harold passed o’er many a mount sublime,

* Iskander is the Turkish word for Alexander, the Christian name for Scanderberg; whose countryman Mr. Gibbon makes Alexander the Great.

Through lands scarce noticed in historic tales;
Yet famed in Attica, such lovely dales
Are rarely seen; nor can fair Tempe boast,
A charm they know not; loved Parnassus fails,
Though classic ground, and consecrated most
To match some spots that lurk within this lowering coast.

The capital of Albania was formerly Albano-poli; but it is now Durazzo. The other principal towns are Scutari, Dulcigno, Antivari, Croya, Alessio, Velona, Dataro, Dibra, &c. Amongst the lakes we may reckon Scutari. The most remarkable river is the Delichi, formerly called Acheron; and, to the class of mountains, we may refer the Acroceraunian, or mountains of Chimæra. The soil of this province is extremely fertile, producing excellent wine. Its manufacturers are chiefly carpets.

The climate of Albania is mild and healthy. In the spring there is seldom much rain, or a long continued drought. The autumnal rains last about a month. In the close of the season, the country is truly delightful; the sky presents the most perfect clearness, and the middle of the day is as warm as our June. The winter lasts but two months in the year, and in summer the heat is oppressive.

Though Albania has frequently changed its name, its masters, and its boundaries, a people have been embosomed in its mountains from time immemorial. The Greek Illyricum, and the Roman Epirus, of which Albania nearly occupies the site, were, however, described as barbarous, because unexplored and unconquered regions. The natives called by the Turks Arnauts, are descended from the ancient Illyrians, whose language and habits are still preserved amongst the mountaineers, and have been called, from their simple and primitive mode of life, the Scythians of the Turkish empire.

Thucydides denominated the Albanians by the general term barbarous, and applies it to a people on the coast of Epirus, opposite the island of Sybota; and Strabo expressly states, that the Epirotic tribes were mixed with the Illyrian, and spoke two languages, probably their own vernacular tongue, and the Greek language, as the Albanians do to this day. The people have been commonly represented as extremely uncivilized. Polybius calls the Illyrians the enemies of all nations; and Livy attributes the ferocity of one of the four Roman divisions of Macedonia, to the fact of its lying contiguous to these people. Epirus, and that part of Illyricum, subsequently distinguished by the term New Epirus, neither the Greeks nor the Romans were able properly to civilize. Ptolemy, the earliest geographer, who mentions the Albani of this district, represents them as a small tribe of Illyrians, possessing the small town of Albanopolis, of which we hear no more for several centuries. It is then described as Albanon, Arbanon, and Elbanon, a town commanding the passes leading from the country about Lychnidus, to the maritime plains. Anna Comment. l. xiii.—Accropolita, c. 14, 25. A tradition exists in the country, that the name of this town was derived from some obscure connexion with Alba in Italy. The situation of the country induced the Greeks of the lower empire,

to apply the name of Albanoi, to all the nations of these, and the contiguous mountains; and to the country itself, that of Αλβανία, Αλβανηρία, and Αρβανηρία. But the inhabitants call the country Skiperi, and an Albanian, they call Skipetar.

The great divisions of modern Albania, according to Major Leake, who is allowed to be the best informed traveller on this head, are those formed by the varieties of the native tribes. Those which are principally recognized, are the Ngege, the Toske, the Liape, and the Tzami. The Ngege, or Ghegides, possess the northern district, as far as the ancient Genusus, and Kavaia. Their principal towns are Dulcigno, Scutari, and Durazzo. The Toske inhabit the great plains of Mizakie and Malakastra, extending from the hills of Dyrrachium to Berat and Avlona, also the mountains bordering on the south side of these plains as far as Lopesi, Tepelini, and Klisara, which are situated on the ancient Aous, the modern Viosa, and the mountains which stretch into Macedonia as far as the district of Koretza. Their chief towns are Berat and Elbasan, the latter of which is the ancient Albanopolis; and the former, next to Skodre, the most important place in the Albanian territory. The Liape, a poor predatory race, inhabit the wild mountains and the sea coast, extending from Toskeri, south as far as the plain of Delvino. The Tzami inhabit all the regions south of the river Kalama,古antly called Thyamis, of which the present name of the tribe is supposed to be a corruption. It extends inland towards Ioannina, and is called Dai by the Albanians, Tzamouria by the Greeks. The chief places are Suli (the Sellii of Strabo), Paramithia, Parga, Liuarati, Aghia, and Margarita. The inferior districts, which, it is presumed, have been detached from the above by the different masters of Albania, comprehend the maritime region opposite Corfu, called Parakalamo, the plain of Delvino, near the ancient Phoenice, Deropul, Zagonia, and the mountains east of Deropul, Reze, Kara-Murata, Kolonia, Premedi, and Khimara. The districts of Konitza, Paleo-Pogoniana and Ioannina, are considered rather as conquests of the Albanians than proper divisions of the country.

Although Albania from time immemorial has been distinguished by the rude valour of its inhabitants, its remote situation, and want of union among its tribes, generally prevented it from acting any conspicuous part in Greecian polities. The only remarkable exception occurs in the reign of Pyrrhus II. who has been justly celebrated as one of the greatest captains of antiquity. After the death of this illustrious commander, the country was again divided into a number of petty states, which fell under the power of the kingdom of Macedon.

The Romans gladly availed themselves of the many fine harbours of the coast; and the traces of the Ignatian road which communicated from Apollonia to Thessalonica, a distance of 262 Roman miles, are still visible. After the decay of the Roman power, Alaric and the Goths took possession of the country. Some of their descendants are afterwards mentioned as having retained possession of the northern districts

Sidismund is particularized for his alliance with Theodoric the Great. It was afterwards the prey of the Slavonian tribes during the eighth, ninth, and tenth centuries. Of these, the Bulgarians were the most prominent. In 870, Achris, or Ocresa, the ancient Lychnidus, was the residence of the Bulgarian kings, and the see of an archbishop; the ancient Nicopolis, and ultimately the whole region, fell under the power of the same race, as is evident from the united testimony of many celebrated historians. 'It was in these ages of the Bulgarian prowess,' says Major Leake, in his *Researches in Greece*, 4to. p. 240, 241,—'that the remains of the Illyrian and Epirotic nations became finally included within the boundaries which they have ever since held.'

It was during the decline of the Greek empire that the Albanians gradually rose to distinction; and at last, to independence. Such was their valour, that they were able to maintain their ground against the Bulgarians, who had occupied all the neighbouring districts of Greece. In the year 1079, historians particularly distinguish them. They formed one of the four divisions of the army of Nicephorus Basilces, and were found to be very important auxiliaries. The Roman kings of Sicily obtained settlements on this coast, as did the Franks and other nations, in their alliance, during the period of the crusades. On the dismemberment of the Oriental empire, by the conquest of Constantinople in 1204, Michael Angelus, illegitimately related to the imperial family, established a despotate in this district, embracing Acarnania, Aetolia, and Epirus, together with the towns of Ioannina, Arta, and Naupactus. This, with some trifling interruption, continued an independent kingdom until 1431, when it fell under the Turkish yoke. The despots of Epirus during this period were counted as allies, not only by the surrounding states, but even the imperial family; and exercised a powerful influence on the neighbouring politics. In 1383 they were defeated by the Turks; but under the command of their celebrated leader, George Castriot, commonly called Scanderberg, they survived and baffled all the efforts of Mahomet II. the conqueror of Constantinople, who, after his entrance into Albania, experienced a succession of defeats and mortifications, till he was ultimately obliged to acknowledge its independence by a formal treaty. The porte had undisputed dominion over the rest of northern Greece. On the death of Scanderberg the Turks redoubled their efforts, and at length reduced Albania to nominal subjection. The siege of Scutari, or Scodra, in 1478, which is perpetuated by Marinus Barletius, a contemporary biographer and eye-witness, formed the termination of this memorable struggle. The subjection, however, was always imperfect; revolts were frequent; and the Venetians who, after aiding them in the siege, obtained some towns, and established themselves in the contiguous Ionian islands, co-operated in preserving their independence, and preventing their complete subjection to the Ottoman faith. Islamism has therefore been far from common; and the Porte has rarely been able to enforce a more absolute submission to its orders than of late years, when

every provincial governor first establishes his influence over the country; and afterwards applies to the Constantinopolitan government for a sanction to his authority. Motives of pay and plunder appear to have had more weight in Albania than any other species of influence; and this was the ruling motive which prevailed upon the Albanian soldiers to unite themselves with the Turkish army. In proportion, however, as the Ottoman empire declined in vigour, its hold of this celebrated kingdom became less firm, till at length the enterprising genius of Ali Pasha, again converted this dependency into what may almost be called a separate kingdom. From the vigorous influence of the above-mentioned chief upon the history and politics of Albania, we shall here present the reader with a brief narration of his history, referring the detail of his memoirs to a separate article.

Until the middle of the last century the kingdom of Albania was divided into several independent pashaliks; of which those of Ioannina, Delvino, and Berat, possessed considerable military force. In 1751, the chief in question was born at Tepelini, a small town in the interior, where his father, a pasha of two tails, exercised a limited jurisdiction. When he was of the age of fifteen years his father deceased, and left the young chief in a very critical situation. He used to boast that he began his fortunate career with sixty paras and a musket; and an Albanian who attended Mr. Hobhouse said, he remembered to have seen the pasha with his jacket out at elbows. Ali shortly after his inauguration was driven from Tepelini, and abandoned by almost all his followers. The inhabitants of Gardiki, a neighbouring town, next formed a plan for his destruction; and for this purpose, surrounded him in a village in the night time, where, although he effected his escape, they seized his mother and his sister, and treated them with every indignity, —injuries for which he took a dreadful vengeance. After his escape, he first entered into the service of Coul, the neighbouring pasha at Berat, and the most important of the chiefs of Albania; where, by his address and activity, he so far insinuated himself as to marry the pasha's daughter. Shortly afterwards he overthrew the pashalik of Ioannina, which (under the sanction of the Porte) he made the centre of his future fortunes; and whence, by money, artifice, force, and treachery, he extended his authority. The pashalik of Arta now submitted to his arms; and the Porte appointed him derveni-pasha of Romelia, guardian of all the passes of the country. In 1798 he was appointed vizier, or a pasha of three tails (a title of honour derived from the number of horses' tails carried before great officers in procession.) His father-in-law being dead, he attacked and defeated the passas of Berat and Delvino in 1811 and 1812; by which means, he gained the finest parts of Albania, and a population of between 200,000 and 300,000 souls. He was induced for some time to preserve pasha Ibrahim in authority at Berat, and contracted with the family, marriages for his sons. The reduction of Prevesa, Vonitz, and Karlili, or Acarnania, conferred new lustre on his enterprizes; and Tepelini (with its inhabitants) now fell into

his power. His series of good fortune had not obliterated the remembrance of the wrongs he formerly received from these people, and he resolved upon taking a signal revenge: he pretended, with his usual duplicity, an oblivion of all grounds of resentment, until he had completely enclosed the city with his troops, when he ordered all the inhabitants who were supposed to have been involved in the guilt, to the number of 700, to be dragged into a large khan near the city, where they were bound together with cords, and on a signal given by Ali, the soldiery stationed on the walls with their musquetry, commenced a most unmerciful fire, which they continued till they were all destroyed. The Sulotes, a people inhabiting the Suli, an almost inaccessible range of mountains, proved the most formidable adversaries with whom Ali had to contend. The Suli are placed in the southern extremity of the Albanian territory; and beneath them winds a river, conjectured by Dr. Holland and others, to be the Acheron of the ancients; the strength of these native bulwarks, the warlike habits of the people, and their contempt of death, rendered them the terror of the Albanians, whom they frequently invaded, while no foreign power ventured to scale the tremendous barriers by which they were guarded. Ali, however, accomplished the difficult project, and entered their retreat; where, after a furious resistance, till the natives were partly extirpated, he acquired permanent possession.

The extent of this chief's dominions are difficult to define, or the degree of authority which he possessed. Even within Albania, Scutari was independent. They are supposed to have been bounded on the north by an irregular line, from Durazzo to the Gulf of Salonica, and to have included the mountainous district of Macedonia, nearly the whole of Thessaly, and part of Livadia. On the east they were bounded by those of Ismael Bey, who rules over the plains of Macedonia. The power of this great man was almost absolute; and while little attention was paid to the imperial firman, a letter with the signature commanded implicit obedience. The Albanians are said to have been enthusiastically attached to him, and to have admired the energy of his character; so that when they heard of any other chief, they used to cry, 'he has not a head like Ali.' It was this, in all probability, which, if it did not invite, at least accelerated, the hand of rivalry.

The terms on which the Albanian vizier held his government, in relation to Constantinople, may be understood from the preceding account of his character and progress. The Porte acknowledged his titles as conferred by the sultan, and the vizier made a formal acknowledgment of the imperial authority by the respectful reception of an annual firman from Constantinople, to which he remitted considerable sums in the shape of a karach or capitation-tax, rents, impost, &c. But in the internal government of Albania the Turks had no interference whatever; nor in Ali Pasha's alliances with foreign states, from which he received and sent agents regularly in his own name. England, France, and Russia, generally kept a consul here; and the political information of the court of Ioannina was said to

be superior to that of Constantinople. The progress of this enterprizing chief was long viewed with jealousy and alarm, but a mutual fear prevented hostilities between him and the Porte; the latter not being in a condition to hazard driving him into an open rebellion. Prudential reasons therefore suggested the propriety of their investing him, by means of their firman, with the sovereignty of all the provinces he won by his sword. Similar motives, perhaps, induced him to pay an outward deference to the Porte, and aid them against foreign enemies. He marched against Paswan Oglou, and was present at the siege of Widden. His son Moustar Pasha, also distinguished himself greatly in the late war against the Russians. The Porte most ardently wished him to repair to Constantinople; and even offered him, in that case, the dignity of grand vizier; but Ali uniformly refused their kindness, knowing that his arrival at that metropolis would be the immediate signal for striking off his head. The late emperor, Napoleon, courted his favour, and is said to have offered him the dignity of king of Albania; but Ali viewed the designs of that ambitious despot with too much alarm to admit him as an auxiliary. To England, therefore, he invariably attached himself, with whose interests and politics Dr. Holland thought him well acquainted.

The military force of Ali was calculated at 100,000 men; his disposable force in the field, however, seldom exceeded 15,000, or his standing army 10,000, of which 5000 were generally stationed round his capital. His treasures arose, first, from a land-tax, amounting to about ten per cent. of the produce; secondly, a tax levied on cities and towns in the shape of a requisition; thirdly, customs which he raised, to about six per cent.; and fourthly, the inheritance of all who die without male heirs, together with other sources too numerous to particularize. His residence was in an immense building near Ioannina, the outer courts of which were crowded with soldiers, and persons of all descriptions who might have petitions to present to him. The mysterious awe which he commanded, was, to Dr. Holland, astonishing. He exercised in person the whole judicial capacity, in which his decisions were equitable; and all petitioners, on their approach, used to kneel and kiss his garments. He rose at six in the morning, and, with the exception of an hour at dinner and an hour at supper, spent the whole day in business. He is said to have been extremely temperate at table; and in his haram, seldom retaining more than 300 females. According to the most accurate information we have been able to obtain, the following description of his character, from a late publication, is just and impartial; and although written in Ali's lifetime, we transcribe entire. 'Ali is now (1815) sixty or sixty-one years of age; his figure is corpulent and unwieldy, his neck short, his stature about five feet nine inches. The expression of his countenance is striking and majestic; and his features give no indications of those terrible qualities by which he is characterized. His abilities are certainly of no mean order. He displays that union of deep thought and contrivance

with prompt and decisive action, which indicates a mind equally formed for politics and for war. He is remarkable for his address, both in gaining friends, and in lulling asleep the suspicions of his bitterest enemies. But if his abilities are of a superior order, his dispositions are of a kind which render him an object of fear and detestation. His cruelty rather resembles that of an Indian savage, than of even the least civilized European. Impaling and roasting alive are among the common punishments reserved for those who have unhappily offended him. The fierceness of his cruelty is only exceeded by the depth of his dissimulation. It is impossible for the most skilful observer to conjecture, from his outward deportment, the real sentiments with which he regards any individual. The only observable difference consists in a peculiar kindness of manner towards those unfortunates, whose cruel doom he has silently and unrelentingly sealed. 'It is nevertheless pleasant,' says Dr. Holland, 'to be able to allege, as one proof of his superior understanding, a degree of freedom from national and religious prejudices rarely to be found among Turkish rulers. He has studiously adopted into his territory several of the improvements of the more cultivated nations; he has destroyed the numerous bands of robbers who infested the peaceful inhabitants of the country; by his direction roads have been made, bridges constructed, and agricultural improvements attempted. This laudable spirit has added respect to the terror inspired by his government; and even those who, out of the immediate reach of his power, can venture to express hatred of his tyranny, are obliged to allow, that Albania is more happy and prosperous under his single and stern dominion, than when divided among numerous chieftains, and harassed by incessant wars. From this opinion, no deference to the principles of despotism can be inferred. The experience of history has proved that a single tyrant is less injurious to the happiness of a people, than tyranny divided among several; and the vizier of Albania has himself become a despot, only by the annihilation of the many despots who preyed on that heretofore distracted and divided country.'

Lord Byron describes his visit to the Pasha's court, in the following beautiful lines:

To greet Albania's chief, whose dread command
Is lawless law; for with a bloody hand
He sways a nation, turbulent and bold:
Yet here and there some daring mountain-band
Disdain his power, and from their rocky hold
Hurl their defiance far, nor yield, unless to gold.

In marble-paved pavilion, where a spring
Of living water from the centre rose,
Whose bubbling did a genial freshness fling,
And soft voluptuous couches breathed repose,
ALI reclined, a man of war and woes;
Yet in his lineaments we cannot trace,
While gentleness her milder radiance throws
Along that aged venerable face, [grace.
The deeds that lurk beneath, and stain him with dis-

It is not that you hoary lengthening beard,
Ill suits the passions which belong to youth;
Love conquers age—so Hafiz hath averred,

So sings the Teian, and he sings in sooth—
But crimes that scorn the tender voice of truth,
Beseeming all men ill, but most the man
In years, have marked him with a tyger's tooth ;
Blood follows blood, and, through their mortal
span,
In bloodier acts conclude those who with blood be-
gan.

This despot was finally defeated by the Turks, and died in a manner suited to his desperate life, being cut down by Turkish officers in 1822. See ALI PASHA.

The physicians of Albania, in the considerable towns, are Greeks, and are for the most part well informed men. The surgeons are Albanians, and very ignorant. Some of their methods are very curious. Mr. Hobbhouse describes the practice of kneading the shoulders, and pulling the limbs for a cold; and another practice in case of fevers, equally curious.—The patient stretches out his arm, and the doctor rubs his thumb along the principal artery, from the wrist up to the shoulder: having by a repetition of this operation thrown the man into a perspiration, he covers him up warm, and leaves him in a fair way of recovery.

The Albanians are of a middle stature; small round the loins, the chests full and broad, the eyes quick and lively. They wear a tight girdle round the waist, and puncture and stain their skin. The women bear many marks of misery, and are rather masculine in their appearance. Their common dress is a coarse cotton, with the head covered by a shawl, clasped under the ears. Some of them have a white woollen dress; and the young women have frequently a scull-cap, under which the hair is braided, and flows down, strung with all their smaller pieces of money. The women in general have a fantastic taste in their dress, and are not very cleanly in their habits. The common attire of the men is a shirt of cotton, drawers of the same materials, a white woollen mantle, and a large great coat or capote with loose open sleeves, and a white woollen or horse-hair band, which often hangs in a small piece behind, but when used upon the head, is pinned into form by a long needle or a pistol ramrod. Their girdle is a coarse shawl, drawn very tight by a belt, containing their pistols; when they rest, they loosen them, and draw their capote about them, and seldom have any other covering. In the summer they throw off the capote and mantle. The poorest Albanian has his pistols in his belt, and also a case knife ornamented, and the handle strung with amulets, and the calanaro, a sort of portable ink-stand and pen, of which they are very proud. Their dress is the most elegant of any used in the Turkish empire, and the agas who can afford it, have it made of rich velvet, embroidered and worked with gold and silver; superadding another, which is a kind of jacket without sleeves. Lord Byron says, the resemblance between the Albanians and the Highlanders struck him forcibly. The inhabitants are very dextrous at the long gun, one of which is to be found in every cottage.

The cottages are neat, consisting for the most part of one floor, divided into two rooms, in one

of which they keep their maize in the stalk or their grapes, which they sprinkle with salt to preserve them. Each person has a small garden, and each village a green for holiday sports, and a circular piece of paved ground attached to it, on which their corn is trodden out by eight or nine horses driven abreast from a stake fixed in the centre. Their food is chiefly vegetables; all classes drink wine, and also an ardent spirit called *rakhee*, extracted from grapes, husks, and barley; they also drink water in large draughts during the most violent exercise without inconvenience. The inhabitants are generally temperate and avaricious, but withal are idle and ignorant. They think it honourable to rob, but disgraceful to steal.

Their forms of salutation are curious: from the rising of the sun to three hours afterwards, they say, '*mire nestrasciu*,' or '*nestrascia emire*,' good morning. From the third hour to noon, '*mire minghiessi*,' a good cheese-making to you, this being cheese-making time. Good day, good evening, and good night, are much the same as with us. To a man in his own house, they say, '*mire mbe sctepji*,' well at home. To a person at work, they say, '*mire mbe pune*,' well at your work; and to those who are reclining in the sun, '*mire mbe diili*,' well in the sun. They are fond of music and dancing; but their execution in both these exercises is extremely imperfect. Notwithstanding these deficiencies, as soon as the daily occupation is over, they begin to sing and play; and each Albanian is his own composer and poet. In their dances there is only one variety: either the hands of the party are locked in each other behind their backs; or every man has a handkerchief in his hand, which is held by the next to him, and so on through a long string of them. The first is a slow dance; the party stand in a semicircle, and their musicians in the middle, continually walking from side to side, accompanying the movements with their music, which are nothing but the bending and unbending the two ends of the semicircle, with some slow footing, and now and then a hop. In the handkerchief dance, which is accompanied with a song from themselves, they are often violent. It is upon the leader of the string that all the principal movements devolve; and all the party take this place by turns. He begins with the song, footing quietly from side to side; then he hops forward, dragging the whole string after him in a circle; and then twirls about, dropping frequently on his knee; and rebounding from the ground with a shout, continues hopping, twirling, rebounding, &c., and then gives his place to the next man, and so on all round the company, each endeavouring to exceed his predecessor in the quickness of his evolutions and movements. Two or three old men often sit in the middle to set the songs, &c. The same dance can be executed by one performer. Mr. Hobbhouse saw a boy of about fifteen, who, by the ease with which he performed the *pirenette*, and other difficult movements, made a very agreeable spectacle. Their chief instruments are the lute, three-stringed guitar, with a very long neck, and a small round base, played with a plectrum formed of a piece of quill half an inch in length.

Their trade is considerable. The exports conducted through the gulf of Arta, are grain, timber, oil, tobacco, cotton, wool, &c. Fifty cargoes of grain are annually sent to the Ionian isles, Italy, and Malta. The timber is grown almost on the shores; and during the revolutionary war, a French agent resided at Arta for the purpose of contracting for supplies of it. Tobacco is cultivated in Upper Albania; cotton is received through Thessaly, and exported to the German and Italian ports of the Adriatic. The only manufactured article exported is the capote, which produces 150,000 piastres annually. The imports are sugar, coffee, cloths, linen, fire-arms, ironmongery, gunpowder, &c. The Albanians are connected with the Greek houses at Trieste, and Maltese houses, through which they receive the manufactures of Great Britain. The people have, from remote antiquity, been distinguished for their contempt of death; and can endure, beyond most men, the extremes of heat and cold. A soldier being condemned to death, was on his way to the place of execution, which was situated without the walls of Prevesa, and being arrived about half way, he said to his conductors, 'why do you wish me to travel half a league farther, in the hottest part of the day, can't you hang me here?' The favour was granted, and he put the rope round his own neck. The same contempt of death is common. They delight in the title of Palikar, which signifies brave. Their discipline is very imperfect; they have so little knowledge of rank and file, that 6000 men would straggle over five or six leagues in marching. They begin their battles with loud shrieks and reproaches, which they renew at every pause. Their fire commences at their own will; and, in battle, each troop collects round its chief, and fights separately from the neighbouring one. Their usual arms are, two pistols in the girdle, an atagar, or cutlass, slightly bent forward, somewhat resembling the harpion of the Greeks, a sabre bent backward, hung horizontally to a belt, and a musket. In fight, they are impatient to come to close quarters with their side arms, with which they mostly succeed. The professions of the Albanians, are shepherd, warrior, and agriculturist; and although they have a university in Ioannina, superintended by eminent Greek professors, the fine arts are

unknown, and the mechanical arts are chiefly practised by foreign residents.

Ali Pasha established a complete system of religious toleration. The Mussulman and the Greek church are, however, the two most prominent religions. The Mahomedan makes no difficulty in observing Easter, and the Greeks often assist at Mussulman ceremonies. Rhamazan reminds us of the old fable of beauty and the beast; and after an obsequious courting, who knows but the nuptials may be completed, and they may both be identified in one despotism of moral empire. The general morals are indifferent. The remains of a feudal independence keep the clans in a constant anarchy; and though under the general jurisdiction of a rigid government, the bones and tombs, scattered every where, evince the frequency of desperate quarrels and seditions. The gypsies, called by the Turks Tchinguees, are numerous in this country. The rights of hospitality are as much respected here, as in Greece during the early ages. Should a mountain traveller enter the house of even a robber chief, he may rely on protection and kindness. Homer's descriptions are still realized here. When a stranger arrives at a village, he is surrounded by the chiefs, invited to the public square, when the old men interrogate him respecting his travels, his country, &c., and relate their chief affairs. He is presented with wine and fruits. At the time of repast, he is invited to one of their houses, a sheep roasted whole is placed before him, and he is admitted to eat with the principal inhabitants.

The Albanian, or Skipetarie, is not a written language. Sometimes the Greek characters have been used to represent Albanian words; but the Greek being familiar to the higher classes of society, is commonly the language used in writing. Major Leake has formed a vocabulary and a grammar of the vernacular tongue; and Mr. Hobhouse, in the appendix to his travels in this country, gives an abridgment of an Albanian grammar, formed in 1716, by an Italian missionary. The chief peculiarity of utterance is the predominance of the nasal sounds. *Leake's Researches in Greece. Holland's Travels. Vaudoucourt's Memoirs of the Ionian Islands. Hobhouse's Albania.*

ALBANO, a lake of Italy, in the Campagno di Roma, of an oval figure, and about seven miles in circumference, surrounded on every side with hills. It abounds with excellent fish, and in one place is said to be unfathomable. An aqueduct, constructed by the Romans, B.C. 398, is still in good preservation here.

ALBANO, a town of Italy, seated on the lake of that name. See last article. Some suppose this to have been the ancient Albanum Pompeii, built out of the ruins of Alba Longa. It stands twelve miles south-east of Rome, and for the pleasantness of its situation is the summer retirement of a great many Roman families. It is likewise the see of a bishop, who is one of the six senior cardinals. The town is famous for its excellent wine, and the ruins of a mausoleum,

which, according to the tradition of the inhabitants, was made for Ascanius. The prospect from the garden of the Capuchins is extremely pleasant, taking in the Campania of Rome, and terminating in a full view of the Tuscan sea. Close by the town lies the Albano, which, by reason of the high mountains round it, looks like the area of a great amphitheatre. The mountain of Albano is called Monte Cavo, on the top of which was a celebrated temple, dedicated to Jupiter and Juno. Near the Capuchins there is another convent of Franciscans; and not far from thence the palace of cardinal Barberini, remarkable for very pleasant gardens, with the ruins of ancient baths, and several old fragments of Mosaic work. Lon. 12°. 50'. E. Lat. 41°. 43'. N.

ALBANO, a town of Naples, remarkable for the fertility of the surrounding territory.

ALBANOIS. See ALBANESES, and ALBGENES.

ALBAN'S HEAD, or HIGHLAND, St. a cape, or point of land lying in the county of Dorset, a little east of the town of Weymouth. W. Lon. 2°. 10. N. Lat. 50°. 4'.

ALBAN'S, St. a town of Hertfordshire, in the hundred of Cashio, a very great thoroughfare, accompanied with good inns, 21 miles N. by W. from London, and 12 miles S. E. of Dunstable. This town sends two members to parliament, elected by all the inhabitants who pay scot and lot; and has one of the best markets for wheat in England; considerable quantities of straw-plait are also brought here. St. Alban's is seated near the ruins of an ancient Roman city, by Tacitus called Verulam; and by the Saxons Watlingcester, because it is seated on the road called Watling-street. The site is said to have been in more ancient times that of the metropolis of Britain. Here queen Boadicea, at the head of a powerful army, made a vigorous assault upon the rising Roman colony; and the elegant pen of Tacitus has recorded the failure of her enterprise, after an immense slaughter. Nothing now remains of Verulam but the ruins of old walls, in the fields adjacent to which Roman coins are still found occasionally, as they formerly found tesselated pavements. In memory of St. Alban, Offa, king of the Mercians, anno 795, erected an abbey, calling it St. Alban's; and near it the town of the same name was afterwards built. Edward VI. granted it a charter, incorporated it under a mayor and burgesses. Charles II. afterwards vested the government in a mayor and twelve aldermen, twenty-four assistant burgesses, a high steward, recorder, coroner, &c. The jurisdiction of this town extends to Rickmansworth, Watford, Barnet, Langley-Abbots, Estree, Bushby, &c. It has a gaol delivery the first Thursday after the quarter-sessions at Hertford. The market-house and the town-hall, in which all the public business of the town is transacted, and under which is the borough gaol, stand in St. Peter's street. The churches are St. Alban's, St. Michael's, St. Peter's, and St. Stephen's. The celebrated duchess of Marlborough endowed nine alms-houses, for thirty-six decayed men and women, with a pension of £12 annually. The church of the abbey still remains; time and weather have made it look like stone although built of brick. When the monasteries were dissolved, the revenues of St. Alban's were estimated at £2510 6s. 1d. according to Speed; and the townsmen paid £400 to prevent the church being levelled with the ground. They have since converted it into a parish church, which for largeness, beauty, and antiquity, has claims not often rivalled. It formerly had a fine font of solid brass, in which the children of the kings of Scotland were in ancient times baptized; and which was brought from Edinburgh by Sir Philip Lea, when the city was in flames; but in the civil wars it was taken away. Not many years since a leaden coffin was discovered in the church, said to be that of Humphrey, duke of Gloucester, youngest son of Henry IV. The body was almost

entire, being preserved in a sort of pickle. There was also once a stately cross in the middle of the town, as there were in many other places where queen Eleanor's body rested, when it was brought out of the north for interment at Westminster; but it has been demolished. The market is on Saturday. The inhabitants, about 5000; and those who pay scot and lot about 600. This town gave the title lord Verulam to Bacon, who was buried in St. Michael's church. In 1451, and 1461, two celebrated battles between the houses of York and Lancaster, were fought near this spot.

ALBANUM, among chemists, denotes salt or urine.

ALBANUM MONS, in ancient geography, now called Mont Albano, sixteen miles from Rome, near where Alba Longa stood.

ALBANUS MONS, in ancient geography, to the north of Istria, called Albius by Strabo; the extremity of the Alps, which, together with the mountains to the east joining it, called Montes Bebii, separated the farther Liburnia and Dalmatia from Pannonia.

ALBANY, a county of the state of New York, on Hudson's river, between Ulster and Saratoga; by which, with Schenectady county, it is bounded on the north, having the county of Hudson or Rensselaer on the east; Green county on the south; and Schoharie county on the west. It comprehends an extent of about 462 square miles, and is of early origin. The state of which it forms a part became a regular settlement, under the Dutch, about the year 1614; and in 1691, Albany county sent two representatives, or delegates, to its first legislative assembly. It has a great variety of soil and produce, is agreeably diversified with hills and dales; and watered by numerous navigable creeks, lakes and rivers. In some places, particularly near its northern boundary, the land is nearly barren indeed, though this county is deemed one of no small importance in North American statistics, the progress of cultivation does not appear to have been very rapid. The population in 1810 amounted to 34,600.

ALBANY, the capital of the above county, and of the state of New York, is situated on the western banks of the Hudson, about 160 miles north of New York city, and 394 miles south of Quebec. In a statistical point of view this is one of the most important cities in the United States. It derives considerable advantages from its situation, as a point of communication on the great roads between the eastern states and western country. In 1797, it is said to have contained about 6000 inhabitants; and in 1810, to have doubled that number. Here are several good places of worship for the episcopalians, presbyterians, the baptists, the methodists, &c.; and several noble public buildings connected with the municipal government of the city, the commerce, amusements, &c. of the inhabitants. Near the capitol or state-house, a reservoir of hewn stone, constructed on a rising ground, receives the water from a spring a few miles distant, and the inhabitants are thus plentifully supplied with water through numerous small aqueducts. There are works here and in the neighbourhood

for the manufacture of mustard, chocolate, tobacco, snuff, starch, &c. equal in extent of business to any on this continent. The climate is healthy; and the inhabitants a mixture of almost every nation. The communication between this place and the city of New York, has, within these few years past, been greatly facilitated by the construction of steam boats, which perform their passages in about thirty-five hours, notwithstanding some rapids and shoals which are found in the passage; and also against the tides, which often are strong in the current of the river.

ALBANY RIVER, in North America, after running in a north-east direction, falls into St. James's bay. It communicates with several small lakes southward of Winnipeg Lake.

ALBANY, the modern district of the colony of the Cape of Good Hope, toward which the emigration of our countrymen has been recently encouraged by government. Its Dutch name is Zuurveldt; and it forms a sub-division of the Drosdy of Uitenhagen. The interest which must now be attached to this spot by many British families, will warrant our noticing it in a distinct article. For more general views of the colony, see **CAPE OF GOOD HOPE**.

The district of Albany was the ancient possession of the Gonaquas Hottentots, a race that is now lost among the Caffres or other native tribes. It is bounded on the north and north-east by Cafraria from which it is separated by the Great Fish River, east and south by the Indian Ocean, and west by other parts of the district of Uitenhagen, from which it is divided by the Sunday River. Its average breadth inland is about thirty miles, and its length seventy miles, containing 2000 square miles, or 1,280,000 acres of land, of which about 1,000,000 acres are unsettled, and destined to be those which shall be first cleared and occupied by the British emigrants.

The Fish River is the principal stream of this part of the colony, and attracted the attention of the Portuguese so far back as the year 1498, when the admiral of their India fleet called it after his own name Rio d'Infanté, and induced his government, on his return, to attempt a settlement on its banks. It is generally understood, on the faith of the Dutch authorities, (for it is remarkable, that no accurate survey of the colony of the Cape is in the hands of government,) *

* 'Truth compels us to state,' says an able article on 'the Cape of Good Hope' in the Quarterly Review, No. XLIII. 'that, during the last twenty years we have held possession of the Cape of Good Hope, not a single survey has been made:—that it is not known what extent of land is cultivable; what rivers are navigable;—to sum up all in one word, there exists no detailed information on which the government at home can venture to make a single grant.' We certainly have not imbibed Mr. Hobhouse's fears, either of a 'burning sun' which is never felt, or of 'the jackals and tigers,' which are easily subdued here; but we do submit that it would have been far more in keeping with the general intelligence of the colonial measures of administration to have met the enquiries of emigrants, with a better ac-

that this river, in common with all the streams of the coast, has a bar of sand across the mouth, which would prevent the entrance of ships of burden: on the other hand, it has been remarked, that it is not probable the Portuguese would have built a fort, as they did, at its entrance, and attempted to have established here a permanent place of refreshment, had they found any such obstacle. It will be curious to be informed from our emigrant friends, whether any modern accretion of this kind has really been formed; or whether, from whatever motives, this is a misrepresentation of the Dutch. The authors of the Universal History make their quarrels with the natives to be the reason of the Portuguese for their abandonment of this coast. Within the bar the Fish River is said to be of sufficient capacity to receive the largest vessels of war. Graham's Town is a new settlement of this district on the banks of the river, and the residence of the deputy landrost, or chief magistrate of Albany.

The Sondag or Sunday River, the second in importance, rises in the Nieuwveldt or Snow mountains, and, after watering a considerable portion of the Graff Reinet district, enters the ocean in a south-east direction in Zwartkops or Algoa Bay. It is with difficulty crossed by the waggons of the colony, no such erection as a bridge having entered into the thoughts of the Dutch farmers of the neighbourhood. Mr. Campbell's Travels in South Africa, 1815, represents the five waggons with him as being dragged over in an hour with ten, and twelve, and one of them, with two and twenty horses; two waggons having been overturned a few days before, by the rapidity of the current.

The other rivers in this district are the Bosjesman's, the Kareeka, the Kasowka, and the Kowie, or Buffalo River, which, though small, are highly acceptable. The road near the banks of the Kareeka, Mr. Campbell represents, as 'strewed with the dung of elephants,' and the trees and shrubbery of the neighbourhood as bearing frequent marks of their passage amongst them. The writer in the Quarterly Review to whom we have referred in a note, and of whose information we are inclined to think highly, says, that 'In the whole range of the colony there are not fifty of these creatures remaining.' This must, however, be speaking a little by anticipation.

Zwartkops, or Algoa Bay, (which see) is the nearest inlet to the proposed new settlements. On its banks stand the town or drosdy of Uitenhagen, which contains the residence of the landrost, the under sheriff, and the principal local authorities of the eastern part of the Cape. Here is a church, a public school, the matrimonial court, (See the article **CAPE OF GOOD HOPE** for its useful functions) and a post office; the latter communicating once a week with Cape Town, which is about 500 miles to the west. 'For the present, therefore,' says the writer just named, 'this place will be the general market for the new settlers; but as population multiplies,

coun. of this district, than could be obtained at Downing-street, or at least to have furnished them with a decent map of the colony.'

and the surplus increases, some of the rivers will no doubt be made accessible, and fishing towns, and villages be established along the shore of Albany.'

In this neighbourhood there is a peculiar facility of procuring salt for any purpose ; one of the largest salt pans of Uitenhagen, being situated near the Sunday River on the borders of the district. It is an object of annual resort to the inhabitants of various neighbouring and remote regions in time of peace. The salt is taken out of the lake in masses of from four to six inches thick, which are broken down by stones or hammers ; but that which accumulates on the banks after a dry wind, is preferred, and is equal to any of the British islands. The bays and inlets here abound with excellent fish, which are said to have been never considerably disturbed, the Dutch boors being too lazy to look after them, even for personal gratification, and the native tribes so singularly indifferent to this advantage as not to ply a single canoe on the shore.

Travellers speak of the general aspect of this district, in the highest terms, and of the agreeable diversity of hill and dale which every where meets the eye and varies the soil. 'Though completely in a state of nature,' says Campbell (and this gentleman made a close survey of Albany, with a permission from the landrost of Uitenhagen to fix upon the most eligible stations for two missionary establishments), 'the country through which we passed was beautiful in the extreme, much resembling a nobleman's park in England. The ground was covered with the finest green, interspersed with single trees and clumps of trees.' 'There is plenty of stone for building in various parts, and timber in every direction.'

Thickets of aloes, euphorbias, and other succulents, sometimes extending to a depth of thirty or forty miles, are uncleared ; and although the plains do not, as heretofore, swarm with game, flocks of hart-bucks and spring-boks are occasionally seen. Here also are the holds of various beasts of prey that infest the colony. In the vales are numerous rills and springs that have been accidentally discovered by travellers : many others are supposed to remain unopened. Graham's Town is never without a sufficient supply of water.

The soil is fit for any species of culture. The coarse sour grass of the plains, which gave its original name of Zuurveldt to the district, has been long suffered to grow and wither annually in unchecked rankness, except when the Caffres have set it on fire. But even this, as well as the heavy brushwood, which is every where found in clumps, argues the vigour of the soil. The vines of the colony are recommended to be cultivated on the sloping lands, and are said rarely to experience an unproductive season. Grain, pulse, artificial grain, and culinary vegetables, would do well in the plains. Tobacco has also been recommended as a staple article of cultivation. The climate is highly salubrious, and neither subject to such sudden changes as that of the Cape Peninsula, nor to equal heat and cold with that of England.

The plan of colonizing this district is as follows :—That the application of the £50,000

voted by the House of Commons, be confined to persons, who, possessing the means, will engage to carry out at least ten able-bodied individuals, above eighteen years of age, with or without families.

That every person so engaging, shall deposit at the rate of £10 for every family taken out; in consideration of which, a passage will be provided at the public expense, and also their victualling, from the time of embarkation, until the time of landing at the colony.

That a grant of land will be made to each person carrying out the aforesaid number, at the rate of 100 acres for every such person or family whom he takes out : one-third of the money advanced by him at the onset, to be repaid to him on landing, when the victualling at the public expense shall cease ; a farther proportion of one-third to be repaid when it is certified to the governor that the settlers are actually placed on the lands assigned to them ; and the remaining third at the expiration of three months from the date of their location.

That the lands will be granted at a perpetual quit-rent, to be fixed, but which will be remitted for the first ten years ; this rent not to exceed in any case £2 sterling for every 100 acres ; subject, however, to a clause, that the lands shall become forfeited to Government in case the party shall abandon the estate, or not bring it into cultivation within a given number of years.

That in the allotment of lands, the interests and the wishes of the parties will be consulted and attended to, as far as it may be consistent with the public and private interests of the colony, the several landrosts having instructions to that effect ; with a caution, however, in the distribution of ground, to preserve the waters, so that the most extensive accommodation may be afforded with regard to future settlers.

That in case 100 families shall proceed together, and apply for leave to carry out with them a minister of their own persuasion, the Governor will, on their being actually fixed, assign a salary to the minister whom they may have selected to accompany them.

The lion, elephant, buffalo, wolf, Cape leopard, and a formidable list of the insect tribe (see our article on the Cape,) are the principal annoyances of the animal world. But the beasts of prey exist in no formidable numbers ; and will necessarily retreat before the march of civilization. The lion of the colony is said to be a remarkably sluggish, and almost timid animal. The elephants have constantly diminished within these few years ; and the buffalo, though fierce when provoked, never attacks unless hunted. The leopard is the most ferocious of all the remaining tribes. Mr. Latrobe speaks of him in common with other travellers, as the tiger of the Cape, but in fact the striped tiger is unknown here. This gentleman gives us the following picture of the ferocity of this comparatively small animal :—One of the wolves that a hunting party of his friends had lamed with a shot, having retreated into the brushwood, a considerable number of the Hottentots followed him there ; when the dogs started an animal, which those among the bushes could not see.

The Hottentots remaining on the outside, perceiving it to be a tiger, called aloud to the missionary to return. He, therefore, with Philip, began to retreat backwards, pointing his gun, and ready to fire, in case the animal made his appearance. Suddenly a tiger sprang forward, but from a quarter not expected ; and by a flying leap over bushes, fastened upon the Hottentot, seizing his nose and face with his claws and teeth. ‘I measured the distance of the place from whence the tiger made his spring, to that on which the Hottentot stood, and found it full twenty feet, over bushes from six to eight feet high.’

Brother Schmitt observed, that if it had not been for the horror of the scene, it would have been a most amusing sight to behold the enraged creature fly, like a bird, over the length of ground and bushes, with open jaw and lashing tail, screaming with the greatest violence. Poor Philip was thrown down in the conflict, and lay now upon, and then under, the tiger. The missionary might easily have made his escape, but his own safety never entered his thoughts. Duty and pity made him instantly rush forward to the assistance of the sufferer. He pointed his gun ; but the motion both of the Hottentot and the tiger, in rolling about and struggling, were so swift, that he durst not venture to pull the trigger, lest he should injure Philip. The tiger perceiving him take aim, instantly quitted his hold, worked himself from under the Hottentot, and flew like lightning upon brother Schmitt. As the gun was of no use in such close quarters, he let it fall, and presented his left arm to shield his face. The tiger instantly seized it with his jaw : brother Schmitt with the same arm catching one of his paws, to prevent the out-stretching claws from reaching his body. With the other paw, however, the tiger continued striking towards his breast, and tearing his clothes. Both fell in the scuffle, and providentially in such a position, that the missionary’s knee, without design, came to rest on the pit of the tiger’s stomach. At the same time he grasped the animal’s throat with his right hand, keeping him down with all his might. The seizure of his throat made the tiger let go his hold ; but not before brother Schmitt had received another bite nearer the elbow. His face lay right over that of the tiger, whose open mouth from the pressure of his wind-pipe, sent forth the most hideous, hoarse, and convulsive groans ; whilst his starting eyes, like live coals, seemed to flash with fire. In this situation brother Schmitt called aloud to the Hottentots to come to his rescue, for his strength was failing, rage and agony supplying to the animal extraordinary force, in his attempts to disengage himself. The Hottentots at length ventured to enter the thicket, and one of them snatching the loaded gun which lay on the ground, presented it, and shot the tiger, under the missionary’s hand, right through the heart. His death was instantaneous ; his eyes shut, his jaw fell, and he lay motionless. Had any life been left, his dying struggles might yet have proved fatal to some of his assailants!—*Latrobe’s Journal of a Visit to South Africa in 1815 and 1816*, p. 306, 308.

The state of the native tribes in this neighbourhood has also been considered as a source of alarm to the new settlers. This can only relate to the present hostility of the Caffres, proceeding, as there is good reason to suppose, from a temporary cause. The Hottentots within the limits of the colony have been but too entirely and unfeelingly subjugated by its former possessors, the Dutch ; and the Bosjesmans, and other wild tribes, are far to the north of this settlement. But in a long-standing quarrel between the chiefs of the Caffre frontier, the British authorities felt it proper to interfere, and even to suffer our forces to assist in carrying off the cattle of one party. For awhile, the line of military forts on Fish River kept the subdued party in check ; but on the withdrawal of the cavalry, they were determined on revenge. They crossed the boundary of the colony in great numbers, and penetrating to the settlement of the Moravians, on the White River, drove away every head of oxen they met with, and killed many of their Hottentot keepers.

The Caffres have been often, of late, completely repulsed ; but the boors are generally ordered to be under arms, to resist any new incursion—a sort of summons which they very readily obey. The fact is, that the Caffre has sound reason to complain of the conduct of Europeans towards his country. During the Dutch sovereignty here, perpetual encroachments on the territories and possessions of these tribes were encouraged, on the title, we may suppose, which Kolhern, the historian, urged on the behalf of the States, to all the land from Mosell Bay to Mozambique, a territory of 300,000 square miles, which he says was originally purchased for 30,000 guilders ! When, or of whom, however, he does not descend to state. The boors a few years since had not so much regard for the life of a Caffre as for that of one of their own oxen ; and no plausible or promising opportunity of seizing their herds was ever overlooked. At the period of our first conquest of the colony, the whole of this district was desolated by the quarrels thus fermenting. The general policy of our government here has certainly been conciliatory ; and the late disturbance is the only serious one that have since taken place.

In conclusion we would say, let not emigrants or their friends overlook the disadvantages of the proposed point of emigration. The glowing pictures of vegetable beauty, which all travellers who have seen the country in the beginning of summer, concur in giving us, must not drive from our recollection the sober truth that summer ends. Of the forests of this coast there are portions, of course, that frown ‘in green or russet o’er the land’ throughout the year ; and the best trees of the colony are certainly found in the district of Albany and its neighbourhood. But there is a sturdiness of growth about them, and the grain is generally too twisted ever to render the timber important as an article of commerce. And no country shews a greater contrast between the beginning and the end of summer. The predominant soil of the colony being a stiff clay, into which no plough will enter until it is

thoroughly soaked with rain, the uncultivated parts when the wet season has terminated, (and plains of many square miles together are and must for ever remain of this description in the interior,) appear wholly naked and smooth, except where a few quartz pebbles, or gravel may glitter to the eye. Now this is the season at which the emigrants who have embarked lately for the Cape, will arrive at that colony. Some objection has been taken on this head to the choice of government with regard to the season of embarkation. To this it has been replied, that the rains beginning to fall partially towards the end of March, and rarely, if ever, later than April, the moment they begin the labours of the field should commence; that a ship leaving England in December, will reach Algoa Bay in March; and there will not then be more than sufficient time for the emigrants to distribute and settle themselves before the rains will have again begun. ‘The new settler will immediately take care to get his potatoes into the ground,’ says the *Quarterly Review*, ‘in order that he may dig up the first produce of his labour by the end of September, or the beginning of October; with these potatoes, a crop of maize or Indian corn, and a few culinary vegetables, he should lay his account for his first year’s supply; and, in truth, this, with the cattle he may purchase from the neighbouring boors at fifty shillings a head, and sheep at six or seven, together with the fish that abound on every part of the coast, especially near the mouths of the rivers, will more than suffice to remove every apprehension of suffering from an actual want of food.’

On the rains of the wet season the principal hopes of the farmer depend. If these fail, the crop fails. But this has been rarely known to occur more than once in seven years. The south-east winds are also occasionally injurious, and the descent of locusts has been sometimes as truly terrific in this neighbourhood as in any part of the world. We cannot but hope that some competent engineers will be found among the new settlers to direct the floods of the rainy season into the most profitable channels; no country would so quickly repay an improved system of irrigation. ‘We are anxious, above all things,’ says the intelligent writer just quoted, ‘to warn the emigrant against the fallacious idea, that he will there reap without sowing; on the contrary, he may lay his account with a few of the first years of his residence being years of toil and anxiety.’

The comparative stupidity and filthiness of the Hottentots—the lazy tyranny of the Dutch boors, who will become his neighbours, and who, in the accumulated filth of some of their establishments, are surpassed by no class of human beings—the want of markets for surplus produce, which will at first be found—the Dutch laws, which at present prevail here, and to which the trial by jury, and the confronting witnesses with the accused, or with each other, are alike unknown—the monopoly of all India and China goods enjoyed by the East India Company—and the depreciated paper currency, especially the two latter, are further annoyances and disadvantages which emigrants and their friends must

add to this account: and thus have we placed before them, according to the most recent and authentic documents, a fair view of their prospects in this part of the world. To this ought also to be now added, 1826, that the first settlers have been greatly disappointed in their views, and that the probable general prospects of this settlement are far from promising.

ALBARA, or ALBORA, among physicians, a name sometimes given to a mixed species of malignant itch, compounded of the morphew, serpigo, and lepra. The albara partakes most of the nature of the leprosy: some make it the same with the leuce, vitiligo, or morphew. See ALPHOS.

ALBARA, in botany, the white poplar.

ALBARDEOLA, in ornithology, a name given by many authors to the platea, or spoonbill; a bird approaching to the nature of the heron.

ALBARI, in antiquity, properly denoted those who gave the whitening to earthen vessels, &c. in which sense they stood contradistinguished from dealbatores, those who whitened walls.

ALBARIUM Opus, in the ancient building, the incrustation or covering of the roofs of houses with white plaster made of lime. This is otherwise called opus album. It differs from tectorium, which is the common name given to all roofing or ceiling, including even that formed of lime and sand, or lime and marble; whereas albarium was restrained to that made of lime alone. The baths of Agrippa, Vitruvius says, were covered with the albarium, which was also used for its ornaments, and would take the polish of marble. The white chunam of Indian architecture, and the white patent stucco of Mr. Chambers, the banker, are also of this description.

ALBARAZIN, an ancient and strong town of Arragon in Spain, seated on an eminence, near the river Guadalaviar, a little below its source, and on the frontiers of Valencia, and New Castile. It is the seat of a bishop, and produces the best wool in all Arragon. Population about 1800; it is about 100 miles east of Madrid. Long. 1°. 16'. W. lat. 40°. 34' N.

ALBARREGAS, a considerable river of South America, in the kingdom of Granada; which descending from the mountains of Bogotá, empties itself into the lake Maracaibo.

ALBA TERRA, one of the numerous names for the philosopher’s stone.

ALBATEGNI, a celebrated astronomer, who lived at the close of the ninth century, and derived his name from the town of Batan, between the Tigris and Euphrates, where he was born. In the year 882, he observed that the autumnal equinox was, on the 19th September, at 13h. 15'. at Aracta, or Ruca, a town of Chaldea. In 883, he found the longitude of the first star of Aries to be 18°. 2'; the obliquity of the ecliptic to be 23°. 35.; and the motion of the earth’s aphelion, and that of the stars, one degree in seventy years. He also ascertained the eccentricity of the earth’s orbit. The imperfections of the astronomical tables of Ptolemy, induced Albategni to compute new ones, which he adapted to the meridian of Aracta. His work, entitled The Science of the Stars, founded on his own

observations, as well as those of Ptolemy, was translated into Latin from the original Arabic, which lies unpublished in the Vatican, by Plato of Tibur. It was published at Nuremberg, in 1537, with some additions by Regiomontanus, and republished at Bologna in 1695, with annotations by the same author. Albategni died in 888. See *Phil. Trans.* 1693, No. CCIV. and *D'Herbelot's Biblioth. Orient.*

ALBATI Equi, in antiquity, a name given to those horses, in the games of the circus, which were distinguished by white cloths or furniture.

ALBATROSS ISLAND, a small island on the north of Van Diemen's land, frequented by innumerable albatrosses and seals. Long. 144°. 4'. E. lat. 40°. 25'. S.

ALBATROSS POINT, a cape of New Zealand. Long. 184°. 42'. W. lat. 38°. 4' S.

ALBATROSSE, in ornithology, a species of the diomedea. See *DIOMEDEA*.

ALBAY, a volcano, and mountain of the island of Lucon, subject to frequent eruptions. It broke forth in the year 1814 with uncommon violence, and laid waste the whole neighbouring province, destroying thousands of the inhabitants.

ALBAZIN, a town of Great Tartary, upon the river Amour, once fortified with a strong castle: it lies on the road from Moscow to Pekin. Long. 104°. 10'. E. lat. 54°. 0' N.

ALBE', { Formed of the three words *al* *Albe'*. Now obsolete.

Saturne anon, to steten strif and dredre

Al be it that it is again his kind,

Of all this strif he gan a remedy find.

Chaucer. The Knights Tale. b. i.
Ne wou'd he suffer sleep once thitherward.

Approach, *albe* his drowsy den was next.

Spenser.

This very thing is cause sufficient; why duties, belonging to each kind of virtue (*albeit* the law of reason teach them) should notwithstanding be prescribed, even by human law.

Hooker.

One whose eyes

(*Albeit* unused to the melting mood)

Drop tears as fast as the Arabian trees

Their medicinal gum.

Shaksp.

LE BEU. Good sir, I do in friendship counsel you To leave this place, *albeit* you have deserv'd High commendation, true applause, and love, Yet such is now the duke's condition, That he mis-construes all that you have done.

Shaksp. As you Like it.

He, who has a probable belief, that he shall meet with thieves in such a road, thinks himself to have reason enough to decline it; *albeit* he is sure to sustain some less (though yet considerable) inconvenience, by his so doing.

South's Sermons.

A flashing pang! of which the weary breast

Would still, *albeit* in vain, the heavy heart divest.

Lord Byron's Childe Harold.

ALBE, in commerce, a small coin, current in Germany, worth only a French sol and seven derniers.

ALBE, a river of France, in Lorraine, which runs into the Sarre, at Sarre-alb, in the department of the Moselle.—Also a river of Hanover, in the principality of Luneburg, which falls into the Aller, near Rethem.

ALBELEN, in ichthyology, the name of a fish of the truttaceous kind, called the Albulla, and much resembling the ferra. It is caught in

the German and other lakes, and is found from five to twelve lbs. weight: its colour is a fine silvery white.

ALBELIUS, in the Linnaean system, a species of anseres, belonging to the genus mergus.

ALBEMARLE, or **AUMARLE**, a town of France, in Upper Normandy, from whence the noble family of Keppel takes the title of earl. The serges of this town are esteemed. It is seated on the declivity of a hill, on the confines of Picardy, 35 miles north-east by north of Rouen, and seventy N.N.W. of Paris. It is the head of a canton in the department of the Lower Seine, arrondissement of Neufchâtel, with 170 houses, and about 1720 inhabitants. Long. 1°. 48'. E. lat. 49°. 46'. N.

ALBEMARLE, a county of Virginia, North America. In extent it is thirty-five miles square, and contains 20,000 inhabitants; the chief town is Charlottesville.

ALBEMARLE SOUND, on the coast of North Carolina, is a kind of inland sea, sixty miles in length, and from eight to twelve in breadth. It lies north of Pamlico Sound, and communicates with it; as it likewise does with the Currituck, Roanoke, and Meherrin rivers. The neck leading into the sea is called Roanoke Inlet.

ALBEN, a market-town and mountain of Carniola, in Germany, where there are mines of quicksilver. It is two miles north-west of Ozirnitz.

ALBENGA, or **ALBENGUA**, a town of Italy, in Genoa, anciently called Albingaunum, and Albium Ingauum. It is the see of a bishop; and was once a handsome town, but is not well peopled on account of the insalubrity of the air. It is situated on a beautiful and well cultivated plain: is a sea-port, about thirty miles south-west of Genoa, and twelve north-east of Oneglia. Long. 8°. 3'. E. lat. 44°. 4'. N.

ALBEOLA, a species of anas.

ALBERNUO, in commerce, a kind of cambillet, brought from the Levant by the way of Marseilles.

ALBERONI, (Julius, Cardinal,) was the son of a poor gardener of Placentia; and born in 1664. At the age of fourteen he obtained a post in the cathedral of Placentia, and in due time became priest and canon. Having had the good fortune to relieve M. Campistron, secretary to the duke of Vendome, when he was robbed near Placentia, he was recommended by him to his general, who took him into Spain; where he rose by several gradations, to the dignity of cardinal, and archbishop of Valentia, and to the office of prime minister, in the court of Spain. He was indebted for both these honours to the patronage of the princess of Parma, whose marriage with Philip V. he had projected and accomplished. Alberoni's disposition was intriguing and enterprising. Not content with effecting some domestic reforms and arrangements, in which were included many regulations favourable to the arts and to commerce; he formed the design of an expedition against Sardinia and Sicily, and in order to prevent the interference of other powers, made an alliance with czar Peter, Charles XII. of Sweden, and the Ottoman Porte. He also proposed exciting the Turks to make war on the emperor,

to advance the pretender to the throne of England, by means of Peter and Charles, to divest the duke of Orleans of the regency of France; and to annihilate the German power in Italy. But an union between England and France, was the result of the discovery of this plan; and these powers concurred in declaring war against Spain, in 1719: making, as the condition of peace, the removal of Alberoni, and his banishment from the kingdom. Having, therefore, in December 1720, received an order to quit Madrid in twenty-four hours, he retired with great wealth; nor was it discovered before he had been two days on his Journey, that he had abstracted the important will of Charles II. of Spain, which appointed Philip universal heir of the monarchy. Being followed, this document could only be wrested from him by force; when pursuing his journey, he was arrested at Genoa, by order of the pope, on the charge of negotiating with the Turks. On his liberation from the convent of the Jesuits, to which he was confined for a year, he engaged in new intrigues, and particularly in an unsuccessful enterprise against the small republic of St. Marino. A bon mot of Benedict XIV. on this occasion has been very generally circulated: ‘Alberoni is like a glutton, who, after having eaten a large salmon, cannot help casting a wishful eye at a minnow.’ His views were more laudably directed to the establishment and endowment of a seminary of education for poor scholars in his native city. Alberoni preserved his health and vivacity to old age; when his conversation usually turned on the recital of his own exploits, and was instructive and amusing; though in his temper he was irascible and impatient. He died in 1752, at the advanced age of eighty-seven, leaving behind him the character of a great politician, daring as Richelieu, and supple as Mazarin, and with as little principle as either. His life, to the year 1719, has been published by John Roussel, translated from the Spanish. A *Testament Politique*, published under the name of Alberoni, in 1753, is considered spurious. *Nouv. Dict. Hist. &c.*

ALBERT, of Aix, or ALBERTUS AQUENSIS, was a canon of Aix-la-Chapelle, in the twelfth century, who travelled in the Holy Land, and wrote a History of the Expedition to Jerusalem, under Godfrey of Bouillon, and other leaders. It is esteemed an accurate narrative, and comprehends a period of twenty-four years. It was printed by Reineccius in 1662. *Voss. de Hist. Lat. lib. iii. c. 6.*

ALBERT I. surnamed the Triumphant, son of Rudolphus I. was elected emperor of Germany on the deposition and death of Adolphus, of Nassau, whom he himself killed in battle in 1298. He was assassinated in 1308, by his nephew, John, duke of Suabia, and other conspirators. During the reign of this emperor the Swiss regained their independence, and laid the foundation of the Helvetic League. *Bon. Fin. 1. 3, dec. 4.*

ALBERT II. surnamed the Grave and the Magnanimous, the son of Albert IV. duke of Austria, was elected emperor in 1438, as also king of Hungary and Bohemia, and died after a short but honourable reign of a year and seven months.

Aventin. Ann. Boior. 1. 7 ; Æn. Silv. Hist. Bohem. c. 56 ; Spondan. Annal. ann. 1437, &c.

ALBERT the Great, in biography, ALBERTUS MAGNUS, so called, on account of his great eruditio[n], was born at Lawingen, in Swabia, about the year 1193, or, as some say, 1205. He was educated at Pavia, and in 1236, made doctor in medicine at Paris; where, having heard father Jourdain, the Dominican, preach, he was induced to take the habit; and on the death of Jourdain, was made vicar-general, then provincial of that order. He taught philosophy, medicine, and theology, at Cologne, and at Paris, to numerous auditories. St. Thomas Aquinas was his pupil, at Cologne. In 1260, he was made bishop of Ratisbon; but at the end of three years resigned that dignity, and retired to Cologne. From hence he travelled through Germany and Bohemia, to preach the crusade; and in 1274 attended the council of Lyons. He continued to instruct the religious of his order at Cologne till the time of his death, November 1280. His very voluminous works were collected by father Jammi, a Dominican of Grenoble, and published at Lyons in 1615, in twenty-one volumes in folio; many of them are supposed to be spurious; but he was undoubtedly the author of numerous works on arithmetic, geometry, perspective or optics, music, astrology, and astronomy; under the titles—*De Sphæra, de Astris, de Astronomia, item speculum Astronomicum, &c.* Being a man of genius and knowledge superior to his contemporaries, he was charged, according to the spirit of the times, with being a magician. He is said to have contrived a kind of androïdes, or machine in the human form, which he had brought to such perfection, that it could speak: and of which many idle tales are related. Some have, without foundation, ascribed to Albert the invention of fire-arms. The chief object of his investigation was, probably, the philosopher’s stone, as this was the ignis fatuus of the age. *Gen. Dict. Durpin cent. xiii. Brucker’s Hist. Philos. by Emsfield, vol. ii. p. 371, 372.*

ALBERT, margrave of Brandenburgh, and the last grand master of the Teutonic order, laid aside the habit of his order, embraced Lutheranism, and concluded a peace at Cracow in 1525, by which he was acknowledged duke of the east part of Prussia, (formerly called for that reason Ducal Prussia,) but to be held as a fief of Poland, and to descend to his male heirs. See PRUSSIA.

ALBERT, (Jane d') daughter of Margaret, queen of Navarre, was betrothed at the age of eleven to the duke of Cleves, but the marriage was annulled. In 1548, she espoused Antony de Bourbon, duke of Vendome; and in 1553 was delivered of a son, afterwards Henry IV. of France. In anticipation of this event, the king, her father, promised to put into her hands his will, on condition that during her labour she should sing a Bearnoise song; accordingly, it is said, when her father entered the chamber, she sang a popular song in the language of her native country. The king, on her delivery, gave her a gold box containing his will, and at the same time threw round her neck a chain of gold,

saying, ‘These are for you, but this is mine!’ taking the infant in his arms, which he carried to his chamber. On the death of her father, in 1555, she became queen of Navarre, and established the protestant religion. Being invited to the French court, to assist at the nuptials of her son with Margaret of Valois, she expired suddenly, not without suspicion of poison, in 1572, in the forty-fourth year of her age. She left several compositions in prose and verse.—*Bayle.*

ALBERT, (Louis Joseph d') son of Louis Charles duke de Luynes, was born in 1672. After serving gallantly in the armies of France, he entered into that of the elector of Bavaria, who, on becoming emperor under the title of Charles VII., created him a prince of the Holy Roman Empire, by the title of Prince of Grimberghen. His political and military engagements did not wholly divert him from literature : his works are, *Le Songe d' Aleibiade*, Paris, 1735, 12mo.; *Timandre instruit par son Genie*, and other pieces, published under the title of *Recueil de Differentes Pieces de Litterature*, Amsterdam, 12mo., 1759. He died in 1758, aged eighty-seven. *Biog. Universelle.*

ALBERT, (Erasmus) a German divine, educated under Luther, known only as the author of a book entitled the *Koran of the Cordeliers*, ridiculing the Franciscans. It was printed in German, with a preface by Luther, in 1531, and in Latin, in 1542. The best edition is that of Amsterdam, in 2 vols. 12mo., 1734. This author died in 1553.

ALBERTET, an Italian mathematician and poet of the thirteenth century, was a native of Provence. He wrote several poems in honour of his Platonic mistress, the marchioness of Malespine, which he left to a friend in order to be presented to the lady, instead of which he sold them to Faber d'Uzes, who published them as his own. The plagiarism being discovered, D'Uzes was whipped for the appropriation, agreeably, it is said, to a then existing law upon the subject. *Vossius Morci.*

ALBERTI, (Leone Baptista,) was descended from a noble family in Florence; and was a proficient in painting, sculpture, and architecture. He wrote on each of these subjects; but his studies did not permit him to leave any thing considerable behind him in painting. He was much employed by Pope Nicholas V., and Lorenzo Medici. His principal erections are at Florence, Mantua, and Rimini. His works are, first, *Momus de Principe*, Rome, 1520; second, *Trivia sive de Causis Senatorii*, 1588, 4to.; third, *Fabes or Apologues*; fourth, *Treatise on Scripture*; fifth, *De Pictura*, Basil, 4to., 1540, and Leyden, (Elzevir) 1649; sixth, *De Re Edificatoria*, 1485. The last has been translated into Italian by Lauro, and was handsomely published in Italian and English in 3 vols. folio, London, 1726. The invention of the Camera Obscura has been ascribed to this artist, who died in 1475.

ALBERTI, (di Villanova Francis) an able lexicographer, was born at Nice in 1737. His principal work is entitled, *Dizionario Universale Critico Encyclopedico della Lingua Italiana*, a new edition of which, in six volumes, was pub-

lished in the year in which he died at Lucca, 1803. *Un. Biog. Dict.*

ALBERTISCHER BASS, in music, a German expression, denoting a species of bass consisting of arpeggios, invented by Dominico Alberti, an amateur, in the year 1730. See Ex. 5.

ALBERTISTS, a sect of scholastics, so named from their leader Albertus Magnus, a man of superior erudition, who was honoured with the title of a magician, and regarded by the alchemists as one of the most successful of their brethren.

ALBERTUS, in commerce, a gold coin, worth about fourteen French livres; and first coined during the administration of Albertus archduke of Austria.

ALBESIA, a kind of shield used by the ancient Albenses, a nation of the Marsi. See DECUMANA.

ALBESZTI, a market town in Wallachia, between the rivers Proava and Chiricon; not far from the Syul. It is 70 miles N. E. of Bucharest.

ALBI, or ALBY, an ancient city of France, the capital of the department of Tarn, seated on the river of that name, which washes its walls, and serves both for defence and ornament. It is situated 335 miles south from Paris, 30 south by west of Rhodes, and 42 north-east of Toulouse. It was the chief city of the Albigensis, and the ci-devant see of an archbishop. The cathedral is dedicated to St. Cecilia, and was once ornamented with a valuable silver shrine, of the Mosaic kind, of exquisite workmanship. It still possesses what is accounted the finest organ in France. The chapel of this pretended saint is magnificent, and adorned with paintings. The Place is a fine large walk without the city; distinguished by a terras above a deep mall, which serves instead of a fosse; and two rows of fine trees, which are kept in excellent order. Here are some inconsiderable manufactories of coarse linen and woolen stuffs. Population 9860.

ALBI, anciently called Alba fuentes, a small town of Naples, in Abruzzo.

ALBICI, the inhabitants of Alboeccc, mentioned by Casar. They were also called Rei Apollinares from their superstitious worship of Apollo. See ALBIOECE.

ALBICILLA, in ornithology, a species of Falco, in the Linnaean system, the aquila albicilla of Brisson, pygargus, albicilla hirundinaria of Bellon, Gesner, and Ray, grand fabler adler of Frisch, white-tailed eagle of Willughby, and cinereous eagle of Pennant and Latham. Its specific characters are, that its cere and feet are yellow, the tail-feathers white, and the intermediate ones black at their vertex. It is of the size of a peacock, and inhabits Europe, particularly Scotland and the neighbouring isles. Aristotle Hist. Anim. lib. ix. b. 32, tom. i. p. 798, gives this species the epithet of Hinnlaria, denoting that it preys upon fawn, that is, young stags, deer, and roe-bucks.

ALBICILLA, in conchology, is a species of the Nerita, with a striated shell, subdorsated lips, the interior tuberculated. It is found at the Cape of Good Hope and in the Indian sea.

ALBIFICATION, *alum facere*, to make white.

Our lampes brenning bothe night and day
 To bring about our craft, if that we may
 Our fournis eke of calcination
 And of wateres alification.

Chaucer. *The Chanones Yemanne's Tale.*

ALBIGENSES, in ecclesiastical history, the name of a religious sect of the twelfth century, eminently distinguished by their zealous opposition to the church of Rome, as well as for the importance of many of the sentiments for which they contended. Too often 'their ashes flew, no marble tells us whither,' and the difficulty attending the detection of facts, amidst imperfect and often contradictory documents, renders it almost impossible to give any very minute and accurate detail, either of their history or opinions. They have been frequently considered as the same people with the Waldenses, but little evidence of this identity can be deduced except their being confounded with them, and condemned under their name, by the decrees of their enemies.

The Albigenses first made their appearance in the vicinity of Toulouse, and the Albigeois in Languedoc, and may, with probability, be considered as a sect of the Paulicians, who, having withdrawn from Bulgaria and Thrace, either to escape persecution, or from motives of zeal to extend their doctrines, settled in various parts of Europe. They acquired different names in different countries, as in Italy, whither they originally migrated, they were called Paterini and Cathari, and in France Albigenses, from the circumstance, as Mosheim affirms, of their opinions being condemned in a council held at Alby, Lat. *Albigia*, in the year 1176. Others, however, maintain that this appellation was derived from the district itself which was their chief residence. Besides these epithets, they were called in different times and places, and by various authors, Bulgarians, Publicans, Boni Homines, or good men, Petro-Brussians, Henricians, Albelardists, Arnoldists, and Passagers. In fact, the term was frequently employed to denote any description of heretic or dissentient from the Romish church. Hence it becomes extremely difficult to ascertain their peculiar sentiments with precision. Upon the authority of several writers, they are charged with holding Manicheism, in which is said to have consisted their chief disagreement from the Waldenses, who are allowed to have held a purer faith. The book of the Sentences of the Inquisition at Toulouse, charges them with believing that there are two Gods and Lords, good and evil; that all things visible and corporeal were created by the devil, or the evil god; that the sacraments of the Romish church are vain and unprofitable; and that, in short, its whole constitution is to be condemned. They are stated to have maintained the unlawfulness

of marriage; to have denied the incarnation of Christ, and the resurrection of bodies; and to have believed that the souls of men were spirits banished from heaven on account of their transgressions.

There were likewise said to be two classes of them; the perfect and the believers. The perfect boasted of their living in continence, of eating neither flesh, eggs, nor cheese. The believers lived like other men, and were even loose in their morals; but they were persuaded they should be saved by the faith of the perfect, and that none could perish who received imposition of hands from them.

The Albigenses became so formidable to the Romish priesthood at the beginning of the thirteenth century, that a crusade was formed for their extirpation; and Innocent III. admonished all princes to oppose and expel them from their dominions. Raymond, earl of Toulouse, who was their chief protector, drew upon his head the thunders of excommunication; and the legate who bore the papal decree, promised a plenary remission of sins to all who engaged in the holy league against them. Dominic, the inventor of the inquisition, joined in this service; and Raymond, after much resistance, at length yielded to terror and self-interest. In the year 1209 the dreadful war began, and Simon, the celebrated earl of Montfort, became generalissimo of the army. Notwithstanding the intrepidity displayed by the objects of this military persecution, town after town was captured, and the poor people, who were stigmatised with the name of heretics, but whom Hume Hist. vol. ii. has characterised as 'the most innocent and the most inoffensive of mankind,' were hanged, slaughtered, and burnt, without mercy. The earl of Toulouse was assisted by the kings of England and Arragon, but he lost his dominions, and in vain appealed to the council of Lateran. Raising some forces in Spain, while his son Raymond exerted himself in Provence, he regained the city of Toulouse, and part of his possessions. The earl died in 1221, and his son succeeded to the dominions he had recovered; but pope Honorius III. stimulated Lewis of France to engage in the contest, and, though he encountered numerous difficulties, Raymond was necessitated at length to obtain peace upon very degrading conditions, and finally relinquished his protestantism; the Albigenses became dispersed, and excited no further attention till they united with the Vaudois, and the Genevan reformed church.

ALBIGNY, a village and lordship of France, in the Lyonnaise.—Also a small town on the river Nerre, in the province of Berry.

ALBIN, or AUBIN, a small town of France, in the department of the Aveyron, and arrondissement of Ville Franche. It contains about 3200 inhabitants, and is eight leagues north-west of Rhodes. E. Lon. 2°. 20'. N. Lat. 41°. 31'.

A L B I N O.

ALBINO, LEUCÆTHIOP, or WHITE NEGROES, a variety of the human species, that frequently occurs in Africa. Ptolemy and Pliny apply the term Leucæthiopes to a tribe of people in Nitritia. The Portuguese first gave the name of Albino to the white negro. Instances are met with in different parts of Europe; but races, the hue of whose skin approaches most nearly to black, are in general most liable to deviations in colour. Albinos have been seen in the Indies, in Borneo, in New Guinea, in Java, and in Ceylon.

The peculiarities of the Albino appertain to the eye, the skin, and the hair. The iris of the eye is of a bright red, or of a blue colour; and the whole organ is peculiarly sensible to the impression of light. The skin is either uncommonly fair, or of a dull white colour, similar to that of a recently dead body. The hair is either white and silky, or of a very flaxen colour; and, according to Dr. Pritchard, when this variety springs up among the negroes, the woolly excretion which covers the heads of that race is white.

These characters have been met with in animals, both wild and domesticated. In the ~~buffalo~~, the common roe, sometimes, though rarely, in the elephant; in the bear, the dromedary, apes, squirrels, rabbits, rats, mice, hogs, moles, opossums, martins, goats, and foxes. Several species of birds, as crows, blackbirds, canary-birds, partridges, fowls, and peacocks, exhibit similar phenomena, having their feathers of a pure white colour, and their eyes red.

Buffon does not consider the Albinoes as a particular race, but as individuals who have accidentally degenerated from the original stock; and considers the production of whites by negro parents as supporting his opinion. According to this author, they are among the negroes what Wafer tells us the white Indians are among the yellow or copper-coloured Indians of Darien.

'It is singular,' he remarks, 'that this variation of nature takes place from black to white only, and not from white to black. It is no less singular, that all the people in the East Indies, in Africa, and in America, where these white men appear, lie under the same latitude: the Isthmus of Darien, the negro country, and the island of Ceylon, are under the very same parallel. White then,' he continues, 'appears to be the primitive colour of nature, which may be varied by climate, by food, and by manners, to yellow, brown, and black; and which, in certain circumstances, returns, but so greatly altered that it has no resemblance to the primitive whiteness.'

The following is Wafer's account of the Albinoes, which are found among the Indians of the Isthmus of Darien: 'They are white, and there are of them of both sexes; yet there are but few of them in comparison of the copper-coloured possibly but one to two or three hundred. They differ from the other Indians chiefly in respect of colour, though not in that only.—Their skins are not of such a white as those of

fair people among Europeans, with some tincture of a blush or sanguine complexion; neither yet is their complexion like that of our paler people, but it is rather a milk-white, lighter than the colour of any Europeans, and much like that of a white horse. For there is this further remarkable in them that their bodies are beset all over, more or less, with a fine, short, milk-white down, which adds to the whiteness of their skins; for they are not so thick-set with this down, especially on the cheeks and forehead, but that their skin appears distinct from it. The men would probably have white bristles for beards, did they not prevent them by their custom of plucking the young beard up by the roots continually.—Their eye-brows are milk-white also, and so is the hair of their heads, and very fine withal, about the length of six or eight inches, and inclining to a curl. They are not so big as the other Indians, and what is yet more strange, their eye-lids bend, and open in an oblong figure, pointing downwards at the corners, and forming an arch, or figure of a crescent, with the points downwards. From hence, and from their seeing so

clear as they do in a moon-shiny night, we used to call them moon-eyed. For they see not very well in the sun, poring in the clearest day, their eyes being but weak, and running with water if the sun shines towards them; so that in the day time they care not to go abroad, unless it be a cloudy dark day. Besides, they are but a weak people, in comparison of the others, and not very fit for hunting or other laborious exercise, nor do they delight in any such. But notwithstanding their being thus sluggish and dull in the daytime, yet when moon-shiny nights come, they are all life and activity, running abroad and into the woods, and skipping about like wild bucks, and running as fast by moon-light, even in the gloom and shade of the woods, as the other Indians do by day; being as nimble as they, though not so strong and lusty. The copper-coloured Indians seem not to respect them so much as those of their own complexion, looking on them as something monstrous. They are not a distinct race by themselves, but now and then one is bred of a copper-coloured father and mother; and I have seen of less than a year old of this sort. Some would be apt to suspect they might be the offspring of some European father; but, besides that the Europeans come little here, and have but little commerce with the Indian women when they do come, these white people are as different from the Europeans in some respects, as from the copper-coloured Indians in others. But neither is the child of a man and woman of these white Indians, white like the parents, but copper-coloured as their parents were. For so Lacenta, the chief of one of the Indian tribes, told me, and gave me this as his conjecture, how these came to be white, that it was through the force of the mother's imagination, looking on the moon at the time of the conception; but this I leave others to judge of. He told me withal, that they were but

short-lived.' This author accompanied Dampier in his voyage round the world.

Dapper, in his *Description de l'Afrique*, speaks of Albinoes as a variety seen in Lower Ethiopia, and remarks, that they have flaxen hair, blue eyes, the countenance and body so white, that at a distance they may be mistaken for Europeans; but when approached the difference is readily perceived. He observes also, that the colour of the skin is not that of a bright or natural white, but pale and livid, like that of a dead body, or of one affected with the leprosy; that their eyes are weak by day, but that by the light of the moon they are brilliant, and their sense of sight strong. They generally sleep during the day, and go abroad in the night. They are mostly males; are not so robust and vigorous as other men, but are exceedingly active during the night; and when the moon shines they run through the forests with as much alacrity as other men do in the brightest day-light. Dapper further remarks, that they are put to labour in the mines of Brazil, but that they prefer death to a life of slavery. The negroes regard them as monsters, and therefore endeavour to prevent them from multiplying their species. As the sight of Albinoes is so feeble during the day that they are almost incapable of discerning any object; the negroes, their enemies, attack them during that time, and readily secure them.

In Saussure's *Voyages dans les Alpes*, is the following account of two boys, at Chamouni, who have been called Albinoes. 'The elder, who was at the end of the year 1785 about twenty, or one and twenty years of age, had a dull look, with lips somewhat thick, but nothing else in his features to distinguish him from other people.—The other, who is two years younger, is rather a more agreeable figure; he is gay and sprightly, and seems not to want wit. But their eyes are not blue; the iris is of a very distinct rose-colour; the pupil too, when viewed in the light, seems decidedly red; which seems to demonstrate, that the interior membranes are deprived of the uvea, and of that black mucous matter that should line them. Their hair, their eye-brows, and eye-lashes, the down upon their skin, were all, in their infancy, of the most perfect milk-white colour, and very fine; but their hair is now of a reddish cast, and has grown pretty strong. Their sight too is somewhat strengthened; though they exaggerate to strangers their aversion for the light, and half shut the eye-lids to give themselves a more extraordinary appearance. But those who, like me, have seen them in their infancy, before they were tutored to this deceit, and when too few people came to Chamouni to make their affection profitable to them, can attest that they then were not much offended with the light of day. At that time, they were so little desirous of exciting the curiosity of strangers, that they hid themselves to avoid such; and it was necessary to do a sort of violence to them before they could be prevailed on to allow themselves to be inspected. It is also well known at Chamouni, that when they were of a proper age they were unable to tend the cattle like the other children at the same age; and that one of their uncles maintained them out of charity, at a time of life

when others were capable of gaining a subsistence by their labour.—I am therefore of opinion that we may consider these two lads as true Albinoes; for if they have not the thick lips and flat noses of the white negroes, it is because they are Albinoes of Europe, not of Africa. This affinity affects the eyes, the complexion, and the colour of the hair; it even diminishes the strength, but does not alter the conformation of the features.—Besides, there are certainly in this malady various degrees: some may have less strength, and be less able to endure the light; but these circumstances in those of Chamouni are marked with characters sufficiently strong to entitle them to the unhappy advantage of being classed with that variety of the human species denominated Albinoes.'

'When nature,' continues this author, 'presents the same appearance often, and with circumstances varied, we may at last discover some general law, or some relation which that appearance has with known causes: but when a fact is so singular and so rare, as that of those Albinoes, it gives but little scope to conjectures: and it is very difficult to verify those by which we attempt to explain it. I at first imagined that this disease might be referred to a particular sort of organic debility; that a relaxation of the lymphatic vessels within the eye might suffer the globules of the blood to enter too abundantly into the iris, the uvea, and even into the retina, which might occasion the redness of the iris and of the pupil. The same debility seemed also to account for the intolerance of the light, and for the whiteness of the hair.'

But professor Blumenbach, who has made many profound observations on the organs of sight, and has considered with great attention the Albinoes of Chamouni, attributes their infirmity to a different cause. He says, it is generally reported to be seen in the warm blood animals; but that he has never met with it in those of cold blood; and is of opinion, that the redness of the iris, and of the other internal parts of the eye, as well as the extreme sensibility that accompanies this redness, is owing to the total privation of that brown or blackish mucus, that, about the fifth week after conception, covers all the interior parts of the eye in its sound state. He observes that Simon Pontius, in his treatise *de Coloribus Oculorum*, long ago remarked, that in blue eyes the interior membranes were less abundantly provided with this black mucus, and were therefore more sensible to the action of light. This sensibility of blue eyes agrees very well, says M. Blumenbach, with northern people, during their long twilight; while, on the contrary, the deep black in the eyes of negroes enables them to support the splendour of the sun beams in the torrid zone. As to the connection between this red colour of the eyes, and the whiteness of the skin and hair, the same learned physiologist says, that it is owing to a similarity of structure, *consensus ex similitudine fabricarum*. He asserts, that this black mucus is formed only in the delicate cellular substance, which has numerous blood-vessels contiguous to it, but contains no fat; like the inside of the eye, the skin of negroes, the spotted palate of several

domestic animals, &c.' And, lastly, he says, 'that the colour of the hair, generally corresponds with that of the iris.' See *Gazette Lett. de Göttingen*, Oct. 1787.

At the time M. Blumenbach was reading this memoir to the Royal Society of Göttingen, M. Buzzi, surgeon to the hospital at Milan, an élève of the celebrated anatomist Moscati, published in the *Opusculi Scelti de Milan*, 1784. t. vii. p. 11, a very interesting memoir, in which he demonstrates by dissection what Blumenbach had only supposed. A peasant of about forty years of age, died at the hospital of Milan of a pulmonary disorder. His body was exceedingly remarkable for the uncommon whiteness of the skin, of the hair, of the beard, and of all the other covered parts. M. Buzzi, who had long desired an opportunity of dissecting such a subject, immediately seized upon this. He found the iris of the eyes perfectly white, and the pupil of a rose-colour. The eyes were dissected with the greatest possible care, and were found entirely destitute of that black membrane which anatomists call the uvea; it was not to be seen either behind the iris, or under the retina. Within the eye there was only found the choroid coat extremely thin, and tinged of a pale red colour, by vessels filled with discoloured blood. What was more extraordinary, the skin, when detached from different parts of the body, seemed also entirely divested of the rete mucosum: maceration did not discover the least vestige of this, not even in the wrinkles of the abdomen, where it is most abundant and most visible. M. Buzzi also accounts for the whiteness of the skin and of the hair, from the absence of the rete mucosum, which, according to him, gives the colour to the cuticle. Among other proofs of this opinion, he alleges a known fact, that if the skin of the blackest horse be accidentally destroyed in any part of the body, the hairs that afterwards grow on that part are always white, because the rete mucosum, which tinges those hairs, is never regenerated with the skin. What is it then that destroys the rete

mucosum in such persons? M. Buzzi relates a singular fact which seems to throw some light on this subject. A woman of Milan, named Calcagni, had seven sons. The two eldest had brown hair and black eyes; the three next had white skins, white hair, and red eyes: the two last resembled the two eldest. It was said that this woman, during the three pregnancies that produced the Albinoes, had a continual and immoderate appetite for milk, which she took in great quantities: but that when she was with child of the other four children, she had no such desire. It is not, however, ascertained, that this preternatural appetite was not itself the effect of heat or internal disease, which destroyed the rete mucosum in the children before they were born. According to Bichât, the internal portion of the hair, consists apparently of two systems of minute vessels. One of these has the functions of the vascular system in general, and affords a passage to excreted fluids; the other contains the colouring matter in the form of a stagnant fluid, the absence of which in the Albino occasions the whiteness, or flaxen colour, of the hair. There appears to be a constant relation preserved between the complexion of the skin, the colour of the hair, and the hue of the pigment of the eye. This is clearly shown in the Albino, and in all kinds of animals liable to a similar variety. The Albino cannot correctly be regarded as afflicted with disease; there is defective organization, but not morbid action, and the phenomena which result from the absence of the black pigment, &c. in this variety of the human species, serve to point out, in the clearest manner, the uses to which these parts are subservient. See *Philos. Trans.* 1706-7. *Nicholson's Journal*, ix. *Sommering, Icones Oculi Humani. Wafer's Account of the Isthmus of America*, 1704. *Sauvage's Voyages dans les Alpes*, &c.

ALBINO, a well-built but small town of Italy, in the Lombardo-Venetian kingdom, district of Bergamasco.

ALBINOVANUS, a Latin poet whom Ovid styled divine. No part of his works is extant, except two elegies on Drusus and Mecænas.

ALBINTEMELIUM, Albintemelium, or at full length, albium intemelium, in ancient geography, now Vintimiglia, situated on the southwest of the territory of Genoa, near the borders of the country of Nice, with a port on the Mediterranean, at the mouth of the Rivulet Rotta, about half way between Monaco and South Remo. Lon. 7°. 40'. E. lat. 43°, 17'. N.

ALBINUS, in ancient history, an African who, having entered into the Roman armies, was made governor of Britain by Commodus; after the murder of Pertinax he was elected emperor by the soldiers in Britain, amounting to about 50,000 men; but Severus having been elected by his own army, met him in Gaul with the same number, attacked and conquered him. His head was cut off by the order of Severus, and his body thrown into the Rhone. He was always attached to a military life, and when at school used to repeat with ardour, the following line from Virgil,

Arma amens capio, nec sat rationis in armis.

Aeneid. ii. 314.

A writer of the name of Codrus gives an exaggerated account of his appetite, according to whom he devoured for breakfast no less than 500 figs, 100 peaches, 20 pounds of dry raisins, ten melons, and 400 oysters.

ALBINUS, (Bernard Siegfred) a celebrated physician and anatomist, was born of an illustrious family, at Frankfort on the Oder, in 1697. His father was then professor of medicine in the university of Frankfort; but in the year 1702, was appointed professor of anatomy and surgery in the university of Leyden. Here the son studied under Boerhaave, the most eminent master in Europe, who, from the abilities which he displayed, had no difficulty in prognosticating his future eminence. On the death of his father, he was appointed to succeed him as professor of anatomy; and delivered an oration, *De vera via ad fabrica humani corporis cognitionem ducente*; which was heard with universal approbation. He wrote, 1. *Index Supellectilis Anatomica Raviana*, 4to. Ludg. Bat. 1725. 2. *De Ossibus*

Corporis Humanæ, 8vo. Lugd. Bat. 1726; an improved edition with plates in 1762. 3. *Historia Musculorum Hominis*, 4to. Lugd. Bat. 1734. 4. *Annotationes Academicæ*, 4 vols. 4to.: besides treatises on the Vascular System of the Intestines, &c. and revised editions of Harvey, Vasalius, Fabricius, and Eustachius; and, after most ably filling the professor's chair for nearly half a century, died at Leyden in 1770.

ALBINUS, (Christian Bernard) brother of the foregoing, was professor of anatomy at Utrecht, where he died in 1752. He is author of 1. *Specimen anatomicum exhibens novam tenuissimam Hominis Intestinorum descriptionem*, Leyden, 4to. 1722, 8vo. 1724; 2. *De Anatomie errores detegente in Medicina*, Utrecht, 1723.—*Biog. Univ.*

ALBIOECE, or **ALEBECE**, in ancient geography, otherwise called *civitatis reiensium*; now Reiz, in Provence, about eighteen leagues to the north-east of Toulon, on the north side of the rivulet Verdon, was originally a Roman colony, and celebrated for the devotion of its inhabitants to Apollo. See **ALBICA**.

ALBION, in ancient geography, album, white, Lat. the island of Great Britain, so called by Cæsar, on account of the chalky cliffs on the English coast. It distinguished this island from Hibernia and the other British islands. Agathemerus, lib. xi. c. 4, speaking of the British islands, says, they are many in number; but the most considerable are Hibernia and Albion; and Ptolemy, lib. ii. c. 3, calls Albion a British island. Pliny, H. N. lib. iv. c. 16. tom. i. p. 222, observes, that the island of Britain, so much celebrated by the Greek and Latin writers, was formerly called Albion; the name of Britain being common to all the islands round it.

ALBION, NEW, a name given by Sir Francis Drake to the extensive district of California, and part of the north-west Coast of America, of which he took possession in 1578. Humboldt, and recent geographers, limit the denomination of New Albion to that part of the coast which extends from the 43rd to the 48th degree of north latitude, which was visited, and all its coasts minutely explored, by Vancouver, in May, 1792. Regarded in an agricultural point of view, says this navigator, I should conceive it capable of high improvement, notwithstanding the soil in general may be considered to be light and sandy. Its spontaneous productions in the vicinity of the woods are nearly the same, and grow in equal luxuriance with those under a similar parallel in Europe; favouring the hope, that if nutritious exotics were introduced, and carefully attended to, they would succeed in the highest degree. The mildness of the climate, and the forwardness of every species of plants, afforded strong grounds in support of this opinion. The interruptions we experienced in the general serenity of the weather were probably no more than were absolutely requisite in the spring of the year to bring forward the annual productions. These were attended with no violence of wind, and the rain which fell, although disagreeable to travellers, was not so heavy as to beat down and destroy the first efforts of vegetation. Under all these favourable circumstances, the country yet

labours under one material disadvantage, in the scarcity of fresh water. The streams, however, that we met with appeared sufficient to answer all purposes, in the domestic economy of life, to a very numerous body of inhabitants; and, were the country cleared and searched, there can be little doubt that a variety of eligible situations might be found for establishments, where, with proper exertions, wholesome water might be procured.

The mountains were covered with pines even to their summits. Insulated peaks, however, were observed towering above the general height of the ridges to which they belonged, and rising far above the line of perpetual snow. Near the coast the country offered the finest prospects. Extensive lawns were seen covered with luxuriant grass, or diversified with woods and flowers, so that no pleasure grounds could have been more skilfully or more agreeably arranged. The soil for the most part was found to be a light sandy loam, in several places of very considerable depth, and abundantly mixed with decayed vegetables. The forests with which the country was covered consisted of poplar, arbor-vita, common yew, black and common dwarf oak, American ash, common hazel, sycamore, maple, oriental astinus, American alder, common willow, the Canadian alder, small fruited crab and Pennsylvanian cherry trees. Aquatic birds are numerous along the shore, and at the outskirts of the woods near the coast were found, in great numbers, the white-headed and brown eagle, ravens, carrion crows, American kingfisher, a very handsome species of wood-pecker, and, on some of the low projecting points and open places in the woods, a bird which seemed to be of the heron species, with a remarkably long neck and legs, and its body equal to the size of the largest turkey. Its plumage is of a light brown, and when erect its height could not be less than four feet. Partridges and humming birds are also found in abundance in the woods. The only living quadrupeds seen by Vancouver or his crew were a black bear, several wild dogs, rabbits, squirrels, rats, mice, and another small animal, whose effluvia was the most intolerable that they had ever experienced. From the skins shewn them by the inhabitants, all the animals common to the western coasts of America seemed to abound in this district.

The country is but thinly inhabited, and the manners of the natives are exactly similar to those of Nootka, described by captain Cook. The only difference is, that they are not so stout, and are less filthy in their habits; not covering their bodies with such a profusion of paint, nor loading their hair with that immense quantity of oil and colouring matter which is customary among the people of Nootka. Their hair in general is neatly combed and tied behind. Their dress is a woollen garment, or the skins of deer, bears, &c. Some wear dresses manufactured of bark, which like their woollen dresses are very neatly manufactured. Their spears, arrows, and other weapons, are generally barbed; some are pointed with common flint, agate, and bone; but most of them with thin flat iron. Their bows, which are made of yew, are of a superior construction,

in general from two and a half to three feet in length, and about three quarters of an inch thick, neatly made, tapering to each end, which terminates in a shoulder and a hook for the security of the bow-string. Their habitations are rude in the extreme, being composed of cross sticks, with a few mats laid upon them. They are a wandering race, living almost entirely by hunting and fishing. But some deserted villages were found.

ALBIREO, a star of the third or fourth magnitude, in the constellation Cygnus.

ALBIS, in ancient geography, now the Elbe, which divided ancient Germany in the middle, and was the boundary of that country, so far as it was known to the Romans: all beyond they reckoned uncertain, no Roman except Drusus, and Tiberius having penetrated so far as the Elbe. A. U. C. 744, or about six years before Christ, Domitius /Enobarbus, crossing the river with a few, merited a triumph; so glorious was it reckoned at Rome to have the passage accomplished. In the following age, however, the river that before occupied the middle of ancient Germany, became its boundary to the north, from the irruptions of the Sarmatae, who possessed themselves of the Transalbin Germany. See **ELBE**.

ALBIUM INGAXNUM. See **ALENGA**.

ALBOGALERUS, in Roman antiquity, a sacerdotal cap, or ornament, worn by the priests, styled *flamen dialis*, otherwise called *galerus*.

ALBOIN, a king of the Lombards, in the sixth century, who, having slain the son of Turisund, king of the Gepidae, when fighting under the banners of his father Audoin, the Lombards requested that he should be permitted to sit at the royal feast, by which the victory was to be commemorated. But as this was contrary to the custom of the country, till the young prince should be invested with arms by a foreign king, Alboin set out with forty of his companions to visit the court of Turisund. At the entertainment prepared for the occasion, Alboin occupied the seat of the prince whom he had slain in battle. This circumstance awakened the feelings of the father: and his surviving son Cunismund, with the other Gepidae, who perceived his agitation, determined to be revenged upon the Lombard prince. They addressed their visitors in the language of reproach and contumely. The Gepidae sprung from their seats at the appointed signal. The young hero and his brave associates grasped their swords; but the rising tumult was instantly assuaged by the interference of Turisund, who generously dismissed Alboin with the blood-stained arms of the prince whom he had slain. When Alboin succeeded to the throne, he asked in marriage the fair Rosamond, the daughter of Cunismund, who now swayed the sceptre of the Gepidae. This request being refused, the Lombard king, with the assistance of the Avars, overturned the kingdom of the Gepidae in 566; and Cunismund having fallen in battle, his fair daughter became the prize, and afterwards the wife, of her victorious lover. Having relinquished these territories to the Avars, who promised to restore them in the event of misfortunes, the Lombards attacked Italy, and made themselves masters of the whole country,

from the mountains of Trent to the gates of Ravenna and Rome, which henceforth became the kingdom of the conquerors. In a feast at Vienna, given by Alboin to his fellow-soldiers, a cup, formed of the skull of Cunismund, was introduced upon the table. The brutal and unfeeling Lombard placed it in the hands of Rosamond. She touched the sacred cup with trembling lips, which at the same instant muttered vengeance against her savage lord. After some fruitless attempts to procure an accomplice, she selected Pereeus, one of the Lombard chiefs; but found it necessary to employ art to secure his assistance. Rosamond secretly supplied the place of one of Pereeus's mistresses, and then assured her deceived companion, that either his death, or that of Alboin, must be the consequence of their criminal indulgence. Pereeus did not hesitate about the alternative which he was to choose. He introduced the assassin into the chamber of his master: Alboin starting from his sleep, attempted to draw his sword, but Rosamond had secured it in the scabbard; and the Lombard king, with only a stool to defend him, fell by the spears of his murderers, A. D. 573. See *Univers. Hist.* vol. p. 337. *Gibbon*, vol. viii. p. 207. chap. 44. *Giannome, Hist. de Naples*, liv. iii. cap. 4.

ALBON, (James D') in biography, marquis of Fronsac, was one of the greatest generals of the sixteenth century, and rose to high military eminence, in the reigns of Henry II. and Charles IX. of France. By the former he was made marshal of France in 1547, and was chosen to carry the collar of his order to Henry VIII. of England, who decorated him in return with that of the garter. He acquired great reputation in the wars of 1552, and 1554; and in 1557, was made prisoner at the battle of St. Quintin. After the death of Henry II. he was one of the triumvirate who governed the kingdom four or five years in spite of Catharine of Medicis. He was killed in 1562, at the battle of Dreux, by a person whose confiscated estate he possessed. The Huguenots, who did not love him, used to call him the Harquebuseer of the west. He had the qualities of a soldier and a courtier; was addicted to every kind of luxury, excelled in politeness and the amiable accomplishments, and on the day of battle was distinguished by his prudence and his courage. His daughter and heiress is said to have been poisoned by her own mother for her property. *Gen. Biog.*

ALBORAK, amongst the Mahomedan writers, the beast on which Mahomet rode in his journeys to heaven. The Arab commentators give many fables concerning this extraordinary animal. It is represented as of an intermediate shape and size between an ass and a mule. A place, it seems, was secured for it in paradise at the intercession of Mahomet; which, however, was in some measure extorted from the prophet, by Alborak's refusing to let him mount him, upon any other condition, when the angel Gabriel was come to conduct him to heaven.

ALBORAN, an island lying between the coast of Spain and Africa.

ALBORG, or **ALBOUR**. See **AALBORG**.

ALBORO, in ichthyology, a name by which

the erythrinus, a small red fish, caught in the Mediterranean, is commonly known in the markets of Rome and Venice.

ALBRICIUS, born at London in the eleventh century, was a great philosopher, an able physician, and well versed in polite literature. He wrote first, *De Origine Deorum*; second, *De Ratione Veneni*; third, *Virtutes Antiquorum*; fourth, *Canones Speculativi*. Other works have been attributed to him, which belong, as is supposed, to a bishop of Utrecht, of his name, who died in 784.

ALBUCA, **BASTARD STAR OF BETHLEHEM**: a genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method, ranking under the tenth order, coronaiae. The characters are: CAL. wanting; COR. six oval oblong petals, which are persistent; STAM. six three-sided filaments the length of the corolla; of these, three are fertile, with versatile anthers; three are barren, without anthers: PIST. an oblong three-sided germen; the stylus three-sided: the pericarpium, an oblong obtuse triangular capsule, having three cells, and three valves: the seeds are numerous, flat, and incumbent. Of this genus Linnæus reckons only two species; viz. first, *Albuca major*, or star flower, with spear-shaped leaves, a native of Canada, and some other parts of North America: Second, *Albuca minor*, or African star flower, a native of the Cape of Good Hope.

ALBUCUS, in botany, a name used by some for the white asphodel.

ALBUGINEA, in anatomy, the outermost coat, or tegument of the eye; otherwise called adnata, and conjunctiva. It takes its name albuginea from its whiteness; as it is this that forms what we call the album, or white of the eye. Albuginea is also applied to the third coat of the testicles; so called from its colour which is white. It is a strong thick membrane, very smooth on the outer surface; the inner, which adheres to the substance of the testicle, being rough and uneven. In its upper part are inserted blood vessels, nerves, and lymphatics, which from thence, send divers branches into the substance of the testicles.

ALBUGIN'EOUS, *albus*, *albumen*, *albugo*, applied to a white speck in the eye; or, partaking of the nature of *albumen*, one of the constituent properties of animal substances.

Eggs will freeze in the *albugineous* part thereof.

Brown's Vulgar Errors.

ALBUGINEUS, in anatomy, a term sometimes applied to the aqueous humour of the eye.

ALBUGO, or **LEUCOMA**, is defined by physicians, to be a distemper occasioned by a white opaque spot, growing on the cornea of the eye, and obstructing vision. See MEDICINE, INDEX.

ALBULA, in ichthyology, a genus of fishes of the truttaceous kind, having no teeth. The principal species are; first, *Albula indica*, a small fish, resembling a herring, caught about the shores of the East Indies, and called by the Dutch the wit-fish. Second, *albula nobilis*, a truttaceous fish, found in great plenty in the lakes of Germany, and other places.

ALBULA, in natural history, mineral waters

of an aluminous kind; hence endowed with an astringent quality, and of use in wounds.

ALBUM, a white table book on which the Praetors recorded their edicts. The names of the senators were written in the *Album Senatorum*. Also a white paper book which foreigners have long been accustomed to provide, with the design of inviting strangers of distinction, or literary eminence to insert their names, together with any observation in prose or verse, as a memorial of their visit. The practice has been of late years extensively adopted in this country.

The composer of this work, in his begging scraps all about, I know not by what means, seems to have lighted on a merry definition of an ambassador, which above eight years before, passing by that way, I had chanced to set down, at my friend's Mr. Christopher Hickamond, in his *album* of friends, after the German custom, which was worded thus: *Legatus est vir bonus peregre missus, ad mentiendum respublicā causā.* *Sir H. Wootton's Lett. to M. Valerus.*

ALBUM, in antiquity, a kind of white table, or register, wherein the names of certain magistrates, public transactions, &c. were entered. Of these there were various sorts, such as the **ALBUM DECURIONUM**, **JUDICUM**, &c. which see.

ALBUM, in alchemy, a tinctorie pretended to transmute metals.

ALBUM, in chemistry, white lead, or ceruse.

ALBUM, in natural history, is used for the white of an egg; more properly called *albumen*.

ALBUM, in pharmacy, is applied to divers compound medicines, of a white colour, as unguentum album, white ointment, &c.

ALBUM AMICORUM, has been used in modern times, to denote a kind of memorandum-book, or literary repository, wherein the men of letters, with whom a person has conversed, inscribe their names with some sentence or motto.—The famous Algernon Sidney, being in Denmark, was by the university of Copenhagen, presented with their *album*, whereupon he wrote these words:

—————
Manus hac inimica tyrannis
Ense petit placidam sub libertate quietem.

ALBUM DECURIONUM, in Roman antiquity, the register wherein the names of the decurionates were entered. It is otherwise called *matriculatio decurionum*.

ALBUM JUDICUM, in Roman antiquity, was a table wherein the names of judges were entered.

ALBUM NIGRUM, is used by some medical writers, for *muscerda*.

ALBUM OCULI, among anatomists, the tunica adnata; also called *albugo*; or the white of the eye.

ALBUM PRÆTORIS, in Roman antiquity, was a book wherein the formulæ of all actions, and the names of such judges as the prætor had chosen to decide causes, were written.

ALBUM RHASIS, in pharmacy, an ointment so called from *Rhasis*, the inventor.

ALBUM SENATORUM, the list of senators' names, which was first introduced by Augustus, and renewed yearly.

ALBUMAZAR, a learned Arabian astronomer, in the tenth century, who wrote a treatise of the Revolutions of the Years.

ALBUMEN, **ALBUMENA**, in physiology, al-

bus, white, has been considered as one of the radical parts of animal substances, which received its name from being first noticed in the eggs of birds, where it forms the white. Fourcroy discovered a similar substance in vegetables. Animal albumen exists, in its most perfect state, in the white of eggs, and in the serum of the blood. It is a viscous fluid, soluble in water at the common temperature, and coagulating when exposed to a heat of 134° Fahr., then it is no longer soluble in water. The vitreous and crystalline humours of the eye, and the liquor that fills the abdomen in dropsy, contain large portions of albumen. As contained in milk, it conduces largely to the nutriment of man.

In the vegetable kingdom it is found principally amongst the narcotic and antiscorbutic plants, where it generally resides in the leaves. Fourcroy first obtained it from the juice of young cresses. Solid albumen, says Dr. Ure, may be obtained by agitating white of eggs with ten or twelve times its weight of alcohol. This seizes the water which held the albumen in solution; and this substance is precipitated under the form of white flocks or filaments, which cohesive attraction renders insoluble, and which consequently may be freely washed with water. Albumen thus attained is like fibrin, solid, white, insipid, inodorous, denser than water, and without action on vegetable colours. It dissolves in potash and soda more easily than fibrin; but in acetic acid and ammonia with more difficulty. When these two animal principles are separately dissolved in potash, muriatic acid added to the albuminous does not disturb the solution, but it produces a cloud in the other. Fourcroy, and several other chemists, have ascribed the characteristic coagulation of albumen by heat to its oxygenation; but cohesive attraction is the real cause of the phenomenon. In proportion as the temperature rises, the particles of water and albumen recede from each other, their affinity diminishes, and then the albumen precipitates. However, by uniting albumen with a large quantity of water, we diminish its coagulating property to such a degree, that heat renders the solution merely opalescent. A new laid egg yields a soft coagulum by boiling; but when, by keeping, a portion of the water has transuded so as to leave a void space within the shell, the concentrated albumen affords a firm coagulum. An analogous phenomenon is exhibited by acetate of alumina, a solution of which, being heated, gives a precipitate in flakes, which redissolves as the caloric which separated the particles of acid and base escapes, or as the temperature falls. A solution containing one-tenth of dry albumen forms by heat a solid coagulum; but when it contains only one-fifteenth, it gives a glairy liquid. One thousandth part, however, on applying heat, occasions opalescence. Putrid white of egg, and the pus of ulcers, have a similar smell. According to Dr. Bostock, a saturated solution of corrosive sublimate let fall into water containing one-two-thousandth of albumen, occasions a milkiness and curdy precipitate. On adding a slight excess of the mercurial solution to the albuminous liquid, and applying heat, the pre-

cipitate which falls, being dried, contains in every seven parts, five of albumen. Hence that salt is the most delicate test of this animal product. The yellow pitchy precipitate occasioned by tannin, is brittle when dried, and not liable to putrefaction. But tannin, or infusion of galls, is a much nicer test of gelatine than of albumen.

The cohesive attraction of coagulated albumen, makes it resist putrefaction. In this state it may be kept for weeks under water without suffering change. By long digestion in weak nitric acid, albumen seems convertible into gelatine. By the analysis of Gay Lussac and Thenard, 100 parts of albumen are formed of 52.883 carbon, 23.872 oxygen, 7.540 hydrogen, 15.705 nitrogen; or in other terms, of 52.883 carbon, 27.127 oxygen and hydrogen, in the proportions for constituting water, 15.705 nitrogen, and 4.815 hydrogen in excess. The negative pole of a voltaic pile in high activity coagulates albumen; but if the pile be feeble coagulation goes on only at the positive surface. Albumen, in such a state of concentration as it exists in serum of blood, can dissolve some metallic oxides, particularly the protoxide of iron. Orfila has found white of egg to be the best antidote to the poisonous effects of corrosive sublimate on the human stomach. As albumen occasions precipitates with the solutions of almost every metallic salt, probably it may act beneficially against other species of mineral poison. For much interesting information respecting this substance, see FOURCROY, *Système des Com. Chimique, and Phil. Trans.* vol. xc. See also CHEMISTRY.

The white of an egg, according to Boerhaave, makes an extraordinary menstruum. Boiled hard in the shell, and afterwards suspended in the air by a thread, it resolves and drops down into an insipid scentless liquor, which appears to be the anomalous unaccountable menstruum of Paracelsus; and will, though it contains nothing sharp, oleaginous, or saponaceous, make a thorough solution of myrrh; which is more than either water, oil, spirits, or even fire itself, can effect. A little putrid white of egg, taken into the stomach, occasions a nausea, horror, fainting, vomiting, diarrhoea, and gripes; it inflames the bile, excites heat, thirst, fever; and dissolves the humours like the plague. On the contrary, the white of fresh-laid eggs, if taken while warm from the hen, is extremely nourishing to the infirm: it may be taken in luke-warm milk; but if any other heat is applied to it, the nutritious quality will be diminished. The fresh white of egg prevents burns from rising in blisters, if it is used immediately after the accident: it mitigates inflammations of the eyes, and preserves the face from sun-burning. In pharmacy, it is used as a medium to render balsams and turpentine, &c. miscible with the aqueous fluids; but as it disagrees with many stomachs when thus taken, a mucilage of gum arabic may supply its place; it being as good a medium in similar circumstances, and not apt to offend the tenderest stomach. Whites of eggs are also useful for clarifying liquors; for which purpose, being mixed and incorporated with the liquors to be clarified, and the whole afterwards

boiled, they carry off the gross parts of the liquor. A solution of that has also been used in cases of contraction and rigidity of the joints. Whites of eggs, beaten in a basin till they coagulate, form the alum curd of Riverius, and alum cataplasm of the London Pharmacopœia. See Egg.

ALBUNA, the tenth Sybil, worshipped as a goddess by the ancient Romans.

ALBUNEA, in ancient geography, a wood on the river Anio, near Tibur, sacred to the Muses, and deriving its name from the sibyl Albunea, to whom a temple was erected at Tibur, the ruins of which yet remain. The albuna fons was a name given to some sulphureous waters that were found near this spot, and which were resorted to for medical purposes.

ALBUQUERQUE, (Alphonso, d') surnamed the great, was born at Lisbon, 1452, and raised the power of the Portuguese to its utmost height in India. He and his brother Francis went to India in 1503 on a voyage of discovery; but Francis arrived first, and having restored the king of Cochin to his capital, was joined by his brother. Here they built a fort, and compelled the Zamorin to sue for peace. The two brothers soon after sailed for Portugal, where Alphonso arrived in safety, but the other was lost. In 1508, Alphonso being appointed governor of the Portuguese settlements in India, subdued Ormuz; but he was soon obliged to quit that place and return to India. Here in an attack on Calicut he was wounded, and compelled to retreat. In 1510 he took Goa, and afterwards the strong city of Malacea; but while about to engage in other enterprises, he was taken ill, and died in 1515. His son Blaise, on his father's death, took the name of Alphonso, pursuant to the command of the king of Portugal, who also conferred on him the rank of nobility. He wrote memoirs of his father's transactions, and died in 1580.—*Morci.*

ALBUQUERQUE, a small city of Spain, in the province of Estremadura, seated on an eminence nine miles from the frontiers of Portugal, and twenty north of Badajos. It is defended by an almost impregnable fortress, built on a high mountain; and carries on a considerable woollen trade. It was founded in the middle of the eighteenth century, and taken in 1735, by the Portuguese, who kept it till the peace of Utrecht. Inhabitants, about 5500.

ALBURN, or AUBURN, from *albus*, white, Lat. and *bruno*, brown, Ital. a compound colour, a mixture of white and red, or reddish brown.

ALBURNUM, the soft white substance, which in trees is found between the liber, or inner bark, and the wood, and in progress of time acquiring solidity, becomes itself the wood. From its colour and comparative softness, it has been styled by some writers *adeps arborum*, the fat of trees. The alburnum is found in largest quantities in trees that are vigorous; though in such as languish, or are sickly, there is a great number of beds. In an oak, six inches in diameter, this substance is nearly equal in bulk to the wood. In a trunk of one foot diameter, it is as one to three and a half; of two and a half feet diameter, as one to four and a half, &c. but these proportions vary according to the health

and constitution of the trees. The alburnum is frequently gnawed in pieces by insects, which lodge in this substance, and are nourished from it.

ALBURNUS, in ichthyology, a fresh water fish, commonly called, in English, the bleak. It is common in our rivers, and in those of Germany and elsewhere; and is esteemed a well tasted fish. It is most in season in September, and is a species of the cyprinus of Linnæus.

ALBUS, in commerce, a small French coin current at Cologne, and worth about a half-penny, English.

ALBUS PISCIS, the white fish, in ichthyology, a name by which Silvian has called *capito-acutris*, and the same with the blue chub, or, as it is more commonly called, the jentling. It is the cyprinus jeses of Linnæus.

ALBURY, or ALDERSBURY, a town in the county of Surry, five miles from Guildford, seated on the Wye, which runs through it.

ALBURY, a town in Hertfordshire, near Putmore heath.

ALBY, a town in the county of Norfolk, four miles from Aylsham.

ALBY, in France. See ALBI.

ALCA, or AUK, in ornithology, a genus of the order of anseres. The beak of the genus is without teeth, short, convex, compressed and frequently furrowed transversely: the inferior mandible is gibbous near the base; the feet have generally three toes. There are twelve species of the alca, of which the most remarkable are:

1. *ALCA ALLE*, the little auk, or black and white diver, with a smooth conical bill, a white streak on the belly and wings, and black feet. The size of this species exceeds not that of a blackbird. It is not very common in Britain, but met with in various parts of Spitzbergen, and Greenland, in company with the black-billed species. In Greenland it is called the ice-bird, being the harbinger of ice. This species is sometimes seen of a pure white.

2. *ALCA ARCTICA*, or the puffin, with a compressed bill and four furrows; the orbit of the eyes and temples are white. The legs of this species are very small; and placed so far behind as to disqualify it from standing except quite erect, resting not only on the foot, but the whole length of the leg. This circumstance, which likewise attends every one of the genus, makes the rise of the puffin from the ground very difficult, and it meets with many falls before it gets on wing; but when that is effected, few birds fly longer or stronger. These birds frequent the coasts of several parts of Great Britain and Ireland; but no place in greater numbers than Priestholm isle, where their flocks may be compared to swarms of bees for multitude. They are birds of passage; and resort there annually about the fifth or tenth of April, quit the place, almost to a bird, and return twice or thrice, before they settle to burrow and prepare for ovation and incubation. They begin to burrow the first week in May; but some few save themselves that trouble, and dislodge the rabbits from their holes, taking possession of them till their departure from the isle. Those which form their own burrows, are at that time so intent on the work as to suffer themselves to be

taken by the hand. This task falls chiefly to the share of the males; who also assist in incubation. The first young are hatched the beginning of July. If a parent is taken at breeding time, and suspended by the wings, it will in a sort of despair treat itself most cruelly, by biting every part it can reach; and the moment it is loosed, will never offer to escape, but instantly resort to its unfledged young: this affection ceases at the stated time of migration, which is most punctually about the eleventh of August, when they leave such young as cannot fly to the mercy of the peregrine falcon, who watches the mouths of the nests for the appearance of the little deserted puffins, which, forced by hunger, are compelled to leave their burrows. Their flesh is extremely rank, as they feed on seaweeds and fish, especially sprats: but when pickled and preserved with spices is admired by those who love high eating. Their noise, when taken, is very disagreeable; being like the efforts of a dumb person to speak. These birds are also common in Ireland; on the island Skerries, three leagues north-north-west of Holyhead; and in the south Stack, near Holyhead, they breed in plenty. This species is also found in the Ferroe Isles, where it is called lunda; and in the Farn Isles, where it is called calterneb, from the shape of the bill. It goes also by various names; such as gulden-head, bottle-nose, and helegug, in Wales; at Scarborough, mullet; and in Cornwall, pope. In America they are said to frequent Carolina in winter; and have been met with in Sandwich Sound: the natives ornament the fore parts and collar of their seal-skin jackets with the beaks of them; and those of Aoonalashka wear gowns of their skins, along with those of other birds. On the coasts of Kamtschatka and the Kurulschi islands they are also common, even as far as Ochotka: the nations of the two first wear the bills about their necks fastened to straps; and according to the superstition of these people, their shaman or priest must put them on with a proper ceremony in order to procure good fortune.

3. *ALCA CIRRIATA*, so called by Pallas, or tufted auk, is somewhat bigger than the common puffin, and the colours much the same; the bill is an inch and three quarters in length, the same in depth at the base, and crossed with three furrows: over each eye arises a tuft of feathers four inches in length, which falls elegantly on each side of the neck, reaching almost to the back; and are white as far as they are attached to the head, but are afterwards of a fine buff yellow; the legs are of a bright red; the claws black. The female is principally distinguished by having the bill crossed only with two furrows instead of three. This species inhabits the shores of Kamtschatka, the Kurile islands, and those intervening between Kamtschatka and America. In manners it greatly resembles the puffin; living all day at sea, but at no great distance from the rocks; it comes on shore at night; burrows a yard deep under ground, and makes a nest with feathers and sea plants; is inonogamous, and lodges there the whole night with its mate. It lays one white egg in the end of May, or be-

ginning of June, which alone is thought fit to be eaten, the flesh of the bird itself being insipid and hard. It feeds on crabs, shrimps, and shell-fish, which last it forces from the rocks with its strong bill. Pallas remarks, that the Kamtschatkan girls imitate the tufts of these birds, which nature has supplied them with, by placing a similar strip of the white skin of the glutton behind each ear, hanging down by way of ornament; and such a present is well received from a lover to his mistress. The bills both of this and the common puffin were formerly held by the natives as a charm, and worn by the priests as amulets; indeed at present these have been fixed round their head dresses, but supposed now to be only esteemed as mere ornaments: the skins are, however, made use of for clothing. It is called in Kamtschatka muechagatka; and in Oschotsta, igilma.

4. *ALCA IMPENNIS*, the northern penguin, or great auk, with a compressed bill furrowed on each side, and an oval spot on each side of the eyes. According to Mr. Martin, this bird breeds on the isle of St. Kilda; appearing there the beginning of May, and retiring the middle of June. It lays one egg, six inches long, of a white colour; some are irregularly marked with purplish lines crossing each other; others blotched with black and ferruginous about the thicker end: if the egg is taken away, it will not lay another that season. Mr. Macauley says, that it does not visit that island annually, but sometimes keeps away for several years together; and adds, that it lays its eggs close to the sea mark, being incapable, by reason of the shortness of its wings, to mount higher. The length of this bird, to the end of its toes, is three feet; but its wings are so small, as to be useless for flight; the length from the tip of the longest quill feathers to the first joint, being only four inches and a quarter. This bird is observed by seamen never to wander beyond soundings; and according to its appearance they direct their measures, being then assured, that land is not very remote. It sometimes frequents the coasts of Norway, the Ferroe Isles, Iceland, Greenland, and Newfoundland; and feeds much on the lump fish, father-lasher, and other fish of that size. The young birds eat rose roots, and other plants. The old ones are very rarely seen on shore, though the young ones are not frequently met with. It is a very shy bird. It walks ill; but dives well, and is taken in the manner used for the razor-bill and puffin. The skin between the jaws is blown into a bladder, and used for the darts of the Greenlanders, as is also that of some other birds. The skin of the body is supposed to be used by the Esquimaux Indians for garments.

5. *ALCA PICA*, or black-billed auk, has the bill of the same form with the torda, but is entirely black. The cheeks, chin, and throat are white: in all other respects it agrees with the torda. Mr. Latham is of opinion that it is no other than the young of that species. Mr. Pennant observes, that it is sometimes found on our coasts; but, according to Mr. Latham, it is in the winter season only, when the common sort

nas quitted them. They are said to be met with on the coasts of Candia, and other parts of the Mediterranean.

6. **ALCA PSITTACULA**, or perroquet auk, of Dr. Pallas, is about the size of the little auk. The bill is much compressed on the sides, in shape convex both above and below, and of a bright red colour: from the remote corner of each eye is a very tender tuft of fine white feathers, hanging down the neck; the head and upper part of the body are dusky; the lower whitish, varied with black edges; the legs are a lity yellow; and the webs dusky. The species is found at Kamtschatka, in the isles towards Japan, and on the western shores of America. They are sometimes seen in flocks, but seldom far from land, except when driven by storms. During night they harbour in the crevices of rocks. They lay an egg almost the size of a hen's, of a dirty white or yellowish colour spotted with brown; which they do about the middle of June, upon the bare rock, or sand, for they make no nest. Like most of the tribe, they are stupid birds, as is evinced by the method of catching them. One of the natives places himself under a loose garment of fur, of a particular make, with large open sleeves, among the rocks at evening; when the birds, returning to their lodging places at dusk, run under the skirts, and up the arm holes for shelter, during the night, and thus become an easy prey. Their stupidity likewise appears from flying aboard ships, mistaking them for roosting places, whereby navigators have been taught to avoid the danger of falling in too near the land, either in the evenings, or on approaching stormy. The eggs are esteemed good.

7. **ALCA TORDA**, or the razor-bill, with four furrows on the bill, and a white line on each side running from the bill to the eyes. These birds, in company with the gullimot, appear in our seas the beginning of February; but do not settle on their breeding places till they begin to lay, about the beginning of May. They inhabit the edges of the highest rocks that impend over the sea, where they form a grotesque appearance, sitting close together, and in rows, one above another. They properly lay but one egg apiece, of an extraordinary size for the bulk of the bird, being three inches long: it is either white, or of a pale sea green, irregularly spotted with black: if this egg is destroyed, both the auk and the gullimot will lay another; if that is taken, then a third: they make no nest, depositing their egg on the bare rock: and though such multitudes lie contiguous, by a wonderful instinct each distinguishes its own. What is also a matter of great amazement, they fix their eggs on the smooth rock with so exact a balance, as to secure it from rolling off; yet should it be removed, and attempted to be replaced by the human hand, it is extremely difficult, if not impossible, to find its former equilibrium. According to Mr. Latham, it is by means of a cement that the bird fixes its egg. The eggs are food to the inhabitants of the coast they frequent, which they get with great hazard, being lowered from above by ropes, trusting to the strength of their companions, whose footing is often so unstable that they are forced down the precipice, and perish together. These birds

are found in the north of Europe, also in Iceland, Greenland, and on the coast of Labrador. In Europe they extend along the White Sea, into the Arctic Asiatic shores, and from thence to Kamtschatka and the gulph of Ochotka. They are the only species which reach the inland Baltic; being found there on the Carls-Ozar isles, near Gothland, and the isle of Bondon off Angermania.

ALCACER-DO-SAL, or **ALCAZAR-DO-SAL**, a town of Portugal, in Estremadura, seated on the river Caldao, thirty-eight miles south-east of Lisbon. It was called Salagia by the ancient Romans, on account of the salt it produces.

ALCAEUS, a famous ancient lyric poet, born at Mitylene in the island of Lesbos, esteemed by Horace the inventor of this kind of poetry. He flourished in the forty-fourth Olympiad, at the same time with Sappho, who was likewise of Mitylene. Alcaeus professed himself a great enemy to tyrants, but was not a very brave soldier. He was present at an engagement, wherein the Athenians gained a victory over the Lesbians; and here, as he himself confessed, he threw down his arms and saved himself by flight. The taste and talents of Alcaeus are undisputed: and though his poems were chiefly in the lyric strain, yet his muse was capable of treating the sublimest subjects with suitable dignity.

ALCAEUS, an Athenian tragic poet, and, as some think, the first composer of tragedies. He renounced his native country Mitylene, and passed for an Athenian. He left ten pieces, one of which was Pasphæc, that which he produced when he disputed with Aristophanes, in the fourth year of the ninety-seventh Olympiad.

ALCAEUS, another poet, mentioned by Plutarch, perhaps the same whom Porphyrius mentions as a composer of satirical iambics and epigrams, and who wrote a poem concerning the plagiarism of Euphorus the historian. He lived about the 145th Olympiad.

ALCAEUS, the Messenian, lived in the reign of Vespasian and Titus, and is said to have suffered, for his lewdness, a very singular kind of death; which gave occasion to the following epitaph:

'Αλκαιος ταφος ετος, &c.

This is Alceus's tomb, who died by a radish; the daughter of the earth, and punisher of adulterers.'

ALCAIEST, n. s. an Arabic word, to express an universal dissolvent, pretended to by Paracelsus and Helmont.

ALCAIC, in ancient poetry, a denomination given to several kinds of verse, from Alcaeus, the inventor. The first kind consists of five feet, viz. a spondee or iambic; a casura, and two dactyls; such is the following of Horace;

Eheu! fugaces, | Postume, | Postume,
Labuntur anhi! | nec pieetas moram.

The second kind of two dactyls and two troches; as

Afferet, | indomitaque | morti:

Besides these two, which are called dactylic alcaicas, there is another styled simply alcaic;

consisting of an epitrite, two choriambi, and a bacchius: the following is of this species.

Cur timet flavum Tiberim | tangere, cufolivum ?

ALCAIC ODE, an elegant kind of ode composed of several strophies, each consisting of four verses; the two first of which are always Alcaicas of the first kind: the third verse is a diameter hypericatalectic, consisting of four feet and a caesura; and the fourth verse is an alcaica of the second kind. The following strophe is of this species, which Horace calls *minaces Alcaci camenæ*.

*O[m]aſtre pulſhra | filia | pulchrior,
Quem eri minoſis | eunque volles modum
Pones | iambis ; ſilve flam̄ma
Sive maſtri libet | Adriana.*

ALCAID, **ALCAYDE**, or **ALCALDE**, in the polity of the Moors, Spaniards, and Portuguese, a magistrate, or officer of justice, answering nearly to the British justice of peace.—The alcайд among the Moors is vested with the supreme jurisdiction, both in civil and criminal cases.

ALCALA DE GAUDERIRRA, a small town of Spain, in Andalusia, upon the river Guadalquivir, six miles S. of Seville. There are abundance of springs, from whence they convey water to Seville by an aqueduct. Lon. $6^{\circ} 46'$. W. Lat. $37^{\circ}. 20'$. N.

ALCALA DE HENAREZ, a beautiful and extensive city of Spain, in New Castile, seated upon the river Henarez, which washes its walls, eleven miles south-west of Guadalaxara, and fifteen E. N. E. of Madrid. The ancient name was Complutum, when it was a Roman colony; and at this place was printed the celebrated *Biblia Complutensia*, or *Complutensian Polyglot*, at a cost of 250,000 ducats to cardinal Ximenes. It was the first polyglot Bible ever printed, and we must gratify our bibliographical readers with one anecdote respecting it. The impression was limited to six hundred copies, three of which were struck off on vellum; one of these being deposited in the Royal library at Madrid; a second in the Royal library at Turin; and the third, supposed to have belonged to the cardinal himself, after passing through various hands, was purchased at the sale of Signor Pinelli's library in 1739, for the late Count M'Carthy of Toulouse, for four hundred and eighty-three pounds. On the sale of this nobleman's library, at Paris in 1817, it was bought by George Hibbert, Esq. of Portland Place, London for 16,100 francs, or £676. 3s. 4d. sterling,

Alcala is built upon a fertile plain and was once a most flourishing place, containing an university, endowed by Ximenes, that rivalled Salamanca, but which has now fallen wholly into decay. Here are still, however, three parish churches, twenty-eight monastic institutions for both sexes, four hospitals, and twenty-four colleges. Cardinal Ximenes lies buried in the university church. Inhabitants about 5000. Lon. $4^{\circ}. 20'$. W. Lat. $4^{\circ}. 35'$. N.

ALCALA LA REAL, a small city of Spain, in Andalusia, with a fine abbey. Population 9000. It is built on the top of a high mountain, near the river Salado, nine leagues from Jaen. Several kinds of exquisite fruits and wines are found

in the vicinity. Lon. $4^{\circ}. 12'$. W. Lat. $37^{\circ}. 38'$. N.

ALCALI, or **ALKALI**. See CHEMISTRY.

ALCAMER, or **ALCAMERE**. See ALCKMAER.

ALCAMO, a town and district of Sicily in the valley of Mazaro, at the foot of Mount Bonifati, on the road to Palermo, twenty-five miles S. of Palermo. Lon. $13^{\circ}. 52'$. E. Lat. $38^{\circ}. 2'$. N.

ALCANITZ, a town of Arragon in Spain, seated on the river Guadaloupe, forty-six miles from Saragossa. It was formerly the capital of the kingdom of the Moors; but being taken from them, it was made a commandery of the order of Calatrava. Lon. $0^{\circ}. 9'$. W. Lat. $41^{\circ}. 0'$. N.

ALCANNA, in commerce, a cosmetic powder, prepared from the leaves of the Egyptian privet, in which the people of Cairo drive a considerable trade. It is much used by the Turkish women to give a golden colour to their nails and hair. There is also an oil extracted from the berries of alcanna, and used in medicine as a quiescent.

ALCANTARA, or **ALCANTARILLA**, a town of Spain, in the province of Andalusia. It stands on an eminence near a morass, where the Romans built a bridge, with a tower at each end.

ALCANTARA, or **VALENZA DE ALCANTARA**, a small, but strong city of Spanish Estremadura, seated on the banks of the Tajo, or Tagus. It lies in a very fruitful soil, and is celebrated for its bridge over that river, which was built, in the time of the emperor Trajan, as appears by an inscription over one of the arches, by the people of Lusitania, who were assessed to supply the expense. At the entrance of the bridge, there was a small antique chapel hewn in a rock by the ancient pagans, who dedicated it to Trajan, as the Christians did to St. Julian. The city is said to have been built by the Moors on account of the convenience of the bridge, which is at a place where the Tajo is very deep, running between two high steep rocks: and for this reason, they called it Al-Cantara, signifying the bridge. It was taken from them in 1214, and given to the knights of Calatrava. The principal occupation of the inhabitants is the trade in wool and cloth. Population 3000. It is 115 miles S.S.W. of Salamanca, 130 W. S. W. of Madrid. Lon. $6^{\circ}. 43'$. W. Lat. $39^{\circ}. 40'$. N.

ALCANTARA, or **ALCANTARILLA**, another town of Spain, in the province of Seville, not far from the Guadalquivir. The Romans built here a bridge, to pass the marshes formed by the river, which is still remaining. It was shut in at each side with a gate, over which was a tower. It is situated fourteen miles south of Seville.

ALCANTARA, a town of Portugal, near Lisbon, in the province of Estremadura, seated on the Tagus; there is a royal palace here with beautiful gardens, grottos, and artificial fountains.

ALCANTARA, a town in the province of Marenham, Brazil; in the bay of St. Marcos, opposite to the island of Marenham. It is built on a semicircular hill, and consists of stone houses one story high. It is a thriving place, as the lands in the neighbourhood are in request for cotton plantation. A handsome stone quay has been built for small craft, upon the inside of a neck of land, round which the harbour extends.

ALCANTARA, THE KNIGHTS OF, a military order of Spain, which took its name from the above-mentioned city. They make a very considerable figure in the history of the expeditions against the Moors; and took the same vows as those of Calatrava, being only distinguished from them by this, that the cross, *fleur de lis*, which they bear over a large white cloak, is of a green colour. They possess thirty-seven commanderies. By the terms of surrender of Alcantara to this order, it was stipulated, that there should be a confraternity between the two orders, with the same practices and observances in both; and that the order of Alcantara should be subject to be visited by the grand-master of Calatrava. But the former soon released themselves from this engagement, on pretence that their grand-master had not been called to the election of that of Calatrava, as had been likewise stipulated. After the expulsion of the Moors and taking of Granada, the sovereignty of these two orders was settled in the crown of Castile by Ferdinand and Isabella.—In 1340, the knights of Alcantara sued for leave to marry, which was granted them.

ALCARAQUE, a river in Spain that falls into the Guadiana, about twenty miles from the city of Badajos, in the province of Estremadura.

ALCARAZ, a small city of Spain, in the province of La Mancha, situated on a mountain of the same name, in a fertile tract, called the Campo di Montiel, near the source of the Guardamena. It has 3300 inhabitants, and is 105 miles S. S. E. of Madrid.

• **ALCARRAZAS**, in pottery, vessels used in Spain for cooling water. They are distinguished principally by their porosity, from other kinds of earthenware, which is so considerable as to allow the liquor to ooze slowly through and stand in small drops on the outside, hence there is a constant evaporation from the surface (though surrounded by a current of warm air) and the water in the jar continues at a much lower temperature than the surrounding atmosphere. In Portugal these vessels are used for moistening snuff or tobacco, the jar for this purpose being filled with snuff and placed in water, which, by filtering slowly through its sides, gives the powder the requisite humidity. The following is an analysis of the clay used for these vessels, according to M. Darcets: sixty parts of calcareous earth mixed with alumina and a little peroxide of iron, and thirty-six of silicious earths mixed with a little alumina, worked up with water and salt, which are dried in it. The pieces are only half baked.

ALCASSAR, a fortified town of Barbary, about two leagues from Larache, in Afgar, a province of the kingdom of Fez. It was of great note, the seat of the governor of this part of the kingdom, and built by Jacob Almanzor, king of Fez, about the year 1180. He designed it for a magazine and place of rendezvous, for the great preparations he was making for the invasion of Spain. The place is now fallen greatly into decay. Not far from hence the famous battle was fought between Don Sebastian, king of Portugal, and the Moors; in which the Portuguese were defeated, and their king slain.

VOL. I.

ALCASSAR-DO-SAL. See **ALCACAR-DO-SAL**.

ALCAVALA, in the Spanish fiances, was at first a tax of ten per cent. afterwards of fourteen per cent, then of six per cent. levied upon the sale of every sort of property, whether moveable or immoveable; and repeated every time the property is sold. It is at this time about five per cent. The levying of this tax requires a multitude of officers sufficient to guard the transportation of goods, not only from one province, but from one shop to another; and it subjects the dealer in all sorts of goods, to the continual visits and examinations of the tax-gatherer. It is to the alcavala, that Ustaritz imputes the ruin of the manufactures of Spain.

ALCAZAR, a city of Spain in New Castile, seated on the river Guardamena, which lies in a very fruitful country, 100 miles north-west of Caithagena.

ALCAZAR LEGUER, a town of Africa, in the kingdom of Fez, which was taken by Alphonzo, king of Portugal, in 1468; but, soon after, abandoned to the Moors. It is seated on the coast of the straits of Gibraltar.

ALCE, ALCES, or ELK, in zoology, the trivial name of a species of the *cervus*, belonging to the order of mammalia pecora. See **CERVUS**.

ALCEA, the HOLLYHOCK, a genus of the polyandria order, belonging to the monodelphia class of plants; and in the natural method ranking under the thirty-seventh order, columniferæ. The characters are; CAL. a double perianthium, monophylous and persistent; the exterior one six-cleft, the interior five-cleft: COR. five petals, coalesced at the base, heart-shaped inversely, and expanding: STAM. numerous filaments, coalesced below in a five-coloured cylinder, loose above, and inserted into the corolla; the antheræ are kidney shaped: PIST. a roundish germen; a short cylindric stylus; and numerous bristly stigmata the length of the stylus. The pericarpium consists of many arilli, jointed into a verticillum about a columnar depressed receptacle. The seeds are solitary, reniform, and depressed. Though Linnaeus mentions two distinct species of this genus, he thinks that the one perhaps is only a variety of the other; but Mr. Miller affirms them to be a distinct species, whose difference in the form of their leaves always continues. First, *Alcea Ficifolia*, a native of Istria. Second, *Alcea Rosea*, a native of China. Its leaves are roundish, and cut at their extremities into angles. Though both species are natives of warm countries, they are hardy enough to thrive in the open air in Britain, and have for many years been some of the greatest ornaments in our gardens, towards the end of summer.

ALCEDO, or KINGFISHER, in ornithology, a genus of the order of picæ. The alcedo has a long, strait, thick, triangular bill; with a fleshy, plain, short, flat tongue. Of this genus there are a great many species, with one or other of which almost every part of the world is furnished. Most of them frequent rivers, and live off fish, the mode of their catching which, is admirable sometimes hovering over the water, where small fishes are seen playing, at other times waiting with attention, on some low branch hanging over the water, for the approach of a single on

who is so unlucky as to swim that way ; in either case dropping like a stone, or rather darting with rapidity on its prey , when, seizing it crosswise in its bill, it retires to a resting-place to feast on it ; which it does piecemeal, bones and all, without reserve, afterwards bringing up the indigestible parts in pellets like birds of prey. The wings of most of the genus are very short ; yet the birds fly rapidly and with great strength. It may be remarked, that throughout this genus, blue, in different shades, is the most predominant colour. This species, found in the South-Sea Islands, are held in a kind of superstitious veneration by the natives ; perhaps, on account of their being frequently seen flying about the morais or burial places. That which inhabits Otaheite, where it is called Erooro, is accounted particularly sacred, and not allowed to be taken or killed. The jacamars are much allied to this genus, and have been ranked under it by Linnaeus. There are above thirty species of this genus, of which the following are the most remarkable, viz.

1. **ALCEDO GALBULA**, or green jacamar, is about the size of a lark. The bill is black, of a square form, a little incurvated and sharp at the point : the plumage, in general, in the upper part of the body, is of a most brilliant green, glossed with copper and gold in different lights : the belly, throat, and vent, are rufous ; the tail is composed of ten feathers, and shaped like a wedge ; the legs are of a greenish yellow, very short and weak ; the claws are black. This species is found, both in Guiana and Brasil, in the moist woods, which it prefers to the more dry spots for the sake of insects, on which it feeds. It is seldom seen except single, as it is a very solitary bird, keeping generally in the thickest parts ; its flight quick, but short ; it perches on branches of a middling height, where it sits all night, and frequently part of the day without stirring. Though these birds are solitary, yet they are far from scarce, as many may be met with. They are said to have a short and agreeable note. The natives of Guiana call this bird Venetore ; and the Creoles, Colibri des grands bois. At Brasil their flesh is eaten by some.

2. **ALCEDO ISPIDA**, or common kingsfisher, is not much larger than a swallow ; its shape is clumsy ; the bill disproportionately long ; it is two inches from the base to the tip ; the upper chap black, and the lower yellow. But the colours of this bird atone for its inelegant form : the crown of the head and the coverts of the wings are of a deep blackish green, spotted with bright azure ; the back and tail are of the most resplendent azure ; the whole under side of the body is orange coloured ; a broad mark of the same passes from the bill beyond the eyes ; beyond that is a large white spot ; the tail is short, and consists of twelve feathers of a rich deep blue ; the feet are of a reddish yellow, and the three joints of the outermost toe adhere to the middle toe, while the inner toe adheres only by one. From the diminutive size, the slender short legs, and the beautiful colours of this bird, no person would be led to suppose it one of the most rapacious little animals that skims

the deep. Yet it is for ever on the wing, and feeds on fish ; which it takes in surprising quantities, when we consider its size and figure. It takes its prey after the manner of the osprey, balancing itself at a certain distance above the water for a considerable space, then darting into the deep, and seizing the fish with inevitable certainty. While it remains suspended in the air, in a bright day, the plumage exhibits a beautiful variety of the most dazzling and brilliant colours. This striking attitude did not escape the notice of the ancients ; for Ibycus, as quoted by Athenaeus, styles these birds *ἀλκυονες τανυστρεποι*, the halcyons with expanded wings. It makes its nest in holes in the sides of the cliffs, which it scoops to the depth of three feet ; and lays from five to nine eggs, of a most beautiful semi-transparent white. The female begins to lay early in the season, and excludes her first brood about the beginning of April. The male, whose fidelity exceeds even that of the turtle, brings her large provisions of fish while she is thus employed ; and she, contrary to most other birds, is found plump and fat at that season. The male, that used to twitter before this, now enters the nest as quietly and as privately as possible. The young ones are hatched at the expiration of twenty days ; but are seen to differ as well in their size as in their beauty. This bird is found not only in Britain, but throughout Europe, Asia, and Africa ; as specimens have been received from China, Bengal, and Egypt. Belon also remarks his having met with it in Romana and Greece ; and Scopoli notices it as a bird of Carniola, where, he says, it remains the whole year as in England. Indeed it bears the rigours of the colder climates so well, that among the Germans it has gained the name of Eisvogel, or Ice bird : Olnia speaks also of its not regarding the ice and cold ; and Gmelin assures us, that it is found even in Tartary and Siberia. But, however this may be, there are few winters in which many of these birds do not perish, apparently from cold alone ; as several have been found frozen stiff by the sides of even running water, without the least mark of violence about them. M. D'Aubenton has kept these birds for several months, by means of small fish put into basins of water, on which they have fed ; for on experiment they have refused all other kinds of nourishment.

This species is the *ἀλκυοναφωνος*, or mute halcyon of Aristotle, which he describes with more precision than is usual with that great philosopher. After this description of the bird follows that of its nest ; than which the most inventive of the ancients have delivered nothing that appears at first more fabulous and extravagant. He relates, that it resembled those concretions that are formed by the sea-water ; that it resembled the long-necked gourd ; that it was hollow within ; that the entrance was very narrow, so that, should it overset, the water could not enter ; that it resisted any violence from iron, but could be broken with a blow from the hand ; and that it was composed of the bones of the *βάροντα*, or sea-needle. The nest had medical virtues ascribed to it ; and from the bird was called Halcyoneum. In a fabulous age, every

odd substance that was flung ashore received that name; a species of tubular coral, a sponge, a zoophite, and a miscellaneous concrete, having by the ancients been dignified with that title from their imaginary origin. Yet much of this is founded on truth. The form of the nest is justly described; and the materials which Aristotle says it was composed of, are not entirely of his own invention. Whoever has seen the nest of the kingsfisher, will observe it strewed with the bones and scales of fish; the fragments of the food of the owner and its young. On the foundation laid by this philosopher, succeeding writers formed other tales; and the poets, indulging the powers of imagination, dressed the story in all the colours of romance. Its nest they represented as a floating one, placed in a tranquil sea, and the bird was supplied with charms, to allay the fury of the turbulent element. The Halcyons were therefore said to be the peculiar favourites of Thetis, the Nereids, and the other sea-goddesses; as to their influence these deities were supposed to owe a repose in the midst of the storms of winter. Aristotle and Pliny tells us, that this bird was most common in the seas of Sicily; that it sat only a few days, in the depth of winter; and that during that period the mariner might sail in full security; for which reason they were styled halcyon days; and the expression became at last proverbial for prosperity in general. The modern fables, that the flesh of the kingsfisher will not corrupt, that it banishes all vermin, and that when hung up dead, its breast always points to the north, are perhaps remains of the old traditions.

3. **ALCEDO PARADISEA**, or paradise jacamar, is of the same size with the former, and has a similar bill: the throat, fore part of the neck, and under wing coverts, are white: the rest of the plumage is of a deep dull green, in some lights appearing almost black, in others with a slight gloss of violet and copper bronze; the tail is composed of twelve feathers of unequal lengths; the two middle ones longest; the legs are black: the toes are placed two before and two behind, and pretty much united. It inhabits Surinam; and like the galbulæ, it feeds on insects; and sometimes, contrary to it, frequents open places. It flies farther at a time, and perches on the tops of trees: it is frequently found with a companion, not being quite so solitary a bird as the other. It also differs in the note, having a kind of soft whistle, often repeated, but not heard a great way off.

4. **ALCEDO KUNIS**, or Egyptian kingsfisher, as described by Hasselquist, is the size of the Royston crow. The bill is blackish, more than half an inch broad at the base, and two inches in length: the head, shoulders, and back, are brown, marked with oblong ferruginous spots: the throat is of a ferruginous white: the belly and thighs are whitish, marked with longitudinal, broadish, cinereous, spots: the upper tail coverts quite white: the quills spotted with white on the inner webs, chiefly at the tips: the tail is ash-coloured: the legs are of a pale green; and the claws blackish. It inhabits lower Egypt, about Cairo; builds in sycamore and date trees; and feeds on frogs, insects, and small fish; which

last it meets with in the fields when they are overflowed. Its cry is not unlike that of the common crow.

5. **ALCEDO TAPARARA** of Buffon, is about the size of a starling. The upper mandible of the bill is black, the lower red: the hind part of the neck, the back, and scapulars, are of an elegant blue; the rump and upper tail coverts bright beryl-blue: the under parts of the body are white; the wing coverts blue, and the legs red. It inhabits Cayenne and Guiana, at which last place the natives call all the kingsfisher tribe by the name of Taparara. In this part of South America, which contains many rivers full of fishes, kingsfishers, as might be expected, abound in vast numbers: but what is remarkable, they never herd together, always being found single, except in breeding time, which is about the month of September. They lay their eggs in the holes of banks, like the kingsfisher of Europe. The cry of this bird imitates the word Carac.

6. **ALCEDO TORQUATA**, or cinereous kingsfisher, is about the size of a magpie, and fifteen inches and a half in length. The bill is three inches and a half long, and brown; the base of the lower mandible reddish: the head is crested: the upper parts of the head and body are bluish ash; the under parts chesnut; the throat is whitish, descending down the neck, and passing behind like a collar, ending towards the back in a point: the under tail coverts are of a pale fulvous, transversely striated with black: lesser wing coverts varied with bluish, ash, black, and yellowish: the legs are red; and the claws blackish. It inhabits Martinico and Mexico: at which last place it is called Achalalactli. This bird migrates into the northern parts of Mexico, at certain seasons only, and is supposed to come there from some hotter parts.

ALCHIATA, in ornithology, a species of the tetrao.

ALCHEMILLA, or **LADIES-MANTLE**: a genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the thirty-fifth order, senticosæ: CAL. a single-leaved perianthium, tubular, and persistent; the mouth flat, and eight-parted; there is no corolla: STAM. four small erect subulate filaments placed in the mouth of the calyx; the anthers are roundish: PIST. an egg-shaped germin: the stylus is filiform, the length of the stamina, and inserted at the base of the germ: the stigma is globular. There is no pericarpium, but the neck of the calyx closed. The seed solitary, elliptical and compressed. Of this genus there are three species, viz.;

1. **ALCHEMILLA ALPINA**, or cinquefoil ladies-mantle, with finger-shaped sawed leaves, and greenish blossoms. It is a native of the mountainous parts of Europe.

2. **ALCHEMILLA MINOR**, or least ladies-mantle, with five smooth leaves growing at a joint and cut into many segments. It grows naturally in Sweden, Lapland, and other cold countries. This and the alpina are eaten by cows and goats; but refused by horses, sheep, and swine.

3. **ALCHEMILLA VULGARIS**, or common ladies-mantle, with leaves plaited like a fan, and

yellowish green blossoms. It grows naturally in pasture lands in this as in most other countries in Europe.

ALCHEMIST, a practitioner in alchemy.

ALCHEMY, from *al*, the, Arab. and Χημία, chemistry, that obsolete or rather pretended branch of chemistry which had for its objects, the transmutation of metals into gold; the panacea, or universal remedy; an alkahest, or universal menstruum; an universal ferment; and many other things equally ridiculous. The origin and antiquity of alchemy are much controverted.—If regard may be had to legend and tradition, it must be as old as the flood. But in fact few of the ancient poets, philosophers, or physicians, from Homer till 400 years after Christ, mention any such thing. The first author who writes of making gold, is Zosimus the Panapolite, who lived towards the beginning of the fifth century, and who has an express treatise, Περὶ τῆς ἱερᾶς τηχνῆς τῆς τὰ χρυσὸν καὶ τὰ αργυρόν ποιησαντος, of the divine art of making gold and silver, extant, in manuscript, in the late French king's library. Kircher, instructed in all the secrets of chemistry, fully exposed the artifices and impostures of alchemists. Mr. Harris very properly distinguishes between alchemy and chemistry; and defines the former to be, *Ars sing arte, cuius principium est mentiri, medium laborare, et finis mendicare*; and the Italians have a proverb, non ti fidare ol alchemista povero o modico amalato. The ruin which has attended this delusion has occasioned several states to make severe laws against pretences to alchemy. The Romans formerly banished all such as professed it; and the sacred canons likewise directed the thunder of their censure against them. Dioclesian and Casar ordered all books which treated of this subject to be burnt. Rymer furnishes us with a licence for practising alchemy, with all kinds of metals and minerals, granted to one Richard Carter in the year 1476; Rym. Fæd. tom. xii. Nevertheless, we have had severe laws against alchemy, and multiplying of metals, as much so as against coining itself. Mr. Thomas Taylor, the ingenious defender of the system of Plato, and translator of the principal part of his works, examines the opinion of Suidas, that alchemy could not be satisfactorily proved more ancient than the time of Dioclesian. He instances, from the Greek Dictionary of the empress Eudocia, p. 108 of Villoison's edition, the following observations concerning the famous golden fleece. 'Dionysius, the Mitylenean, says, a man whose name was Krius, this name means also a ram, was the pedagogue of Phiyxus, and that the sheep skin had a golden fleece, not agreeably to poetical assertion, but that it was a book written in skins, containing the manner in which gold ought to be made, according to the chemical art. Justly therefore, says he, did those of that period denominate the skin golden through the energy proceeding from it.'—This Dionysius, as Fabricius shews, lived somewhat prior to Cicero. Again Manetho, in the fourth book of his Apotelesmatica, p. 66, says, 'Venus alone, in conjunction with the beautiful Phæton, the sun, points out makers of gold and workers of Indian ivory.' This Manetho lived in the

time of Ptolemy Philadelphus, to whom he dedicates his work. Alchemical knowledge was anciently kept secret, but the invention of printing, and a more extended spirit of enquiry, have caused all its nostrums and mysteries to disappear.

ALCHIMELLA. See **ALCHEMILLA**.

ALCIOLEA, a kind of food in use among the western Moors, being fleshy meat, pickled, dried and potted.

ALCHORNEA, in botany, a genus of the dioecia monadelphia class and order of professor Martyn, and monadelphia octandria of Schwartz and Gmelin, the characters of which are: CAL. of the male, a three or five-leaved perianthium; leaflets ovate, concave, equal, coloured, and deciduous: no corolla. STAM. eight filaments, equal, scarcely longer than the calyx, slightly connate at the base; antheræ ovate and upright: PIST. a rudiment; the calyx of the female is a one-leaved, four or five-toothed perianthium, the teeth equal and small; no corolla; the pistillum has a germ twin, superior; styles two, very long and filiform; stigmas simple and acute; the pericarpium, a capsule berried, two-seeded, two-celled, two-valved; the seeds solitary, large and oblong: there is one species, viz. *Alchornea latifolia*.

AL'CHIYMIZE, *v.* DEDUCED by some
AL'CHYMY, from the Arabic *al*, the,
ALKYM'ISTRIE, and *χεύω*, to melt. Per-
ALCHYM'ICAL, haps it may be defined
ALCHYM'ICALLY, the pouring and mixing
AL'CHYMIST, of mineral substances,
ALCHYMIST'ICAL, in a state of fusion, in
ALCHYMIST'ICALLY, order to obtain the pre-
cious metals supposed to be contained therein.

And whan this *alkymistre* saw his time,
Riseth up, sire preest, quod he, and stondeth by me;
And for I wote wel, ingot had ye non,
Goth, walketh forth, and bringeth a chalk ston.

Chaucer. *The Chanones Yemannes Tale*, b. ii.

White *alchymy* is made of pan brass one pound, and arsenicium three ounces; or *alchemy* is made of copper and auripigmentum.

Brown's Vulgar Errours.
Raymond Lully would prove it *alchymically*.

Camden.

To solemnize this day, the glorious sun
Stays in his course, and plays the *alchymist*;
Turning, with splendour of his precious eye,
The meagre cloddy earth to glittering gold.

Shaksp. *King John*.

Every *alchymist* knows, that gold will endure a vehement fire for a long time without any change; and after it has been divided by corrosive liquors into invisible parts, yet may presently be precipitated, so as to appear in its own form.

Grew.

Compared to this,

All honour's mimick; all wealth, *alchymy*.

Donne.

They bid cry,
With trumpets regal sound, the great result;
Tow'rs the four winds, four speedy cherubim
Put to their mouths the sounding *alchymy*,
By herald's voice explained. Milt. Par. Lost.

It was by the means of fantastical ideas and notions, that chemistry was turned into *alchymy*; astronomy into judicial astrology.

Bolingbroke's *Essay on Human Know-*

Time was, when I know not what mystical meanings were drawn, by a certain cabalistic *alchymy*, from the simplest expressions of holy writ.

Horsley's Sermons.

ALCIATTI, (Andrew,) a celebrated lawyer, who flourished in the sixteenth century, born at Milan. Thuanus highly commends him for mingling much of polite learning in the explication of the laws, and divesting it of barbarous technicalities. He published a great many law books, and some notes upon Tacitus.

ALCIBIADES, a famous Athenian general, was the son of Clinias, who fell at the battle of Coronæ, by Dionomache, the daughter of Xanthippus, who overthrew the Persians at Mycale; and the sister of Pericles, the celebrated orator. He was born B. C. 405, and lived at a time when his country was a scene of confusion. The Greeks, grown insolent from their conquests in Persia, turned their arms against each other, under the conduct of the two most opulent states, Athens and Lacedæmon. Alcibiades, in the midst of an expedition he had planned against the enemy, was recalled home to answer some charge of a private nature; but fearing the malice of his enemies, instead of going to Athens, he offered his services to Sparta, where they were readily accepted. By his advice the Lacedæmonians made a league with Persia, which gave a favourable turn to their affairs. But his credit in the republic giving rise to jealousies against him, he privately reconciled himself to his country, and took again the command of an Athenian army. Here victory attended all his motions. The loss of seven battles obliged the Spartans to sue for peace. He enjoyed his triumphs, however, only a short time at Athens; one unsuccessful event making it expedient for him to retire. In his absence the Spartans again took the lead, and at the fatal battle of Aegos entirely subdued the Athenian power. Alcibiades, though an exile, endeavoured to restore the power of his country; of which the Spartans having intelligence, procured him to be assassinated. He was a man of admirable accomplishments, but indifferent principles; of great parts, and of an amazing versatility of genius.

ALCIBIADUM, or ALCIBIUM, in botany, a word used by the ancients as an epithet for a kind of echium, or vipers bugloss, and sometimes as the name of a peculiar plant.

ALCIDES, in mythology, an epithet of Hercules.

ALCINOUS, in fabulous history, a king of the Phœnicians, in the island now called Corfu, son of Nausithous, and grand-son of Neptune and Peribæa. His gardens have immortalized his memory. He received Ulysses with great hospitality, when a storm had cast him on his coast.

ALCMÆON, the thirteenth and last perpetual archon of Athens, died, after reigning only two years, in the third year of the sixth Olympiad, A. A. C. 754.

ALCMAER, a city of North Holland, about four miles from the sea, and twenty-four N.N.W. from Amsterdam. It is one of the cleanest towns in Holland; and the town-house, and ar-

senal have been much admired. It had formerly two parish churches situated near each other, dedicated to St. Matthew and St. Lawrence. The latter had so high a tower that it served for a sea mark, but it fell down in 1464, and so much damaged the other, that they were both demolished in 1470, and one church was built in their stead, dedicated to the same saints. The Spaniards, under the command of Frederic of Toledo, son of the duke d'Alva, came to besiege it, after they had taken Haerlem in 1573; but were forced to raise the siege, after lying before it three months, as well on account of the infection of the air as the brave resistance of the inhabitants and soldiers; even the women signalizing themselves boldly in its defence. In this city, in the year 1637, 120 tulips, with the offsets, sold for 90,000 florins; and one of them, called the viceroy, for 4203 guilders! The states at last put a stop to this extravagant passion for flowers, which had ruined so many, or rather to the speculative passion of gambling in them as an article of commerce, by severe penalties. The town has a very good trade in butter, and cheese, which are esteemed the best in Holland; as well as in grain, seeds, and flower roots. It is well fortified, and contains, besides the Catholic churches, two Calvinist, one Lutheran, and one Baptist church, as well as a Jewish synagogue. Inhabitants from 9000 to 10,000. Alcmaer was taken and held for a short time by the British in 1799; here is a canal which leads from Hoorn through Alcmaer to Petten, and serves to unite the Zuyderzee with the North sea. Lon. 4°. 21'. E. Lat. 52°. 38'.N.

ALCMAN, a lyric poet, was born at Sparta, and flourished in the twenty-seventh Olympiad. He composed several poems, of which only some fragments remain, quoted by Athenaeus and some other ancient writers. He was very amorous: accounted the father of gallant poesy; and is said to have been the first that introduced the custom of singing love songs in company. He is reported to have been one of the greatest eaters of his age. He died of a strange disease; for he was eaten up with lice.

ALCMANIAN, from Alcman, see last article, in ancient lyric poetry, a kind of verse consisting of two dactyls and two trochees, as,—

Post equitem sedēta tra | cura,

Some authors mention other Alcmanian verses, composed of three dactyls, and a cæsura; as,

Munera | lotitijamque Dei.

ALCMENA, in mythology, the daughter of Electryon, king of Mycenæ, and wife of Amphitryon. Jupiter, assuming the form of her betrothed husband, while he was abroad in the wars, made her the mother of Hercules; Amphitryon is said to have been proud of the circumstance.

ALCO, in zoology, the canis Americanus of Linnaeus, about the size of a squirrel, with a small head, pendulous ears, curved body, and short tail. There are two varieties, viz. the fat alco, ytzcuintle-porzothli, canis Mexicanus of Hernandez, which is extremely fat, head very small, ears pendulous, with the fore part of the head very white, and yellowish ears, short neck, arched back, yellow hair, white short pendulous

tail, large belly, spotted with black, white legs and feet, and the female with six conspicuous paps; and the techichi of Fernandes, which is like the small dogs of Europe, except that it has a wild and melancholy air. The first of these approaches the Iceland dog, and the second is perhaps the same animal with the koupara, or crab-dog of Guiana, which in figure resembles the fox, and in its hair the jackal. It has been called the crab-dog, because it lives chiefly upon crabs and other testaceous animals.

ALCOCK, (John,) LL.D. and bishop of Ely, in the reign of Henry VII. was born at Beverley in Yorkshire, and educated at Cambridge. He was first made dean of Westminster, and in 1471, was consecrated bishop of Rochester; in 1476, he was translated to the see of Worcester; and in 1486, to that of Ely. He was a man of great learning and piety; and so highly esteemed by king Henry, that he appointed him lord president of Wales, and afterwards lord high Chancellor of England.

Alecock founded a school at Kingston upon Hull, and built the spacious hall belonging to the episcopal palace at Ely. He was also the founder of Jesus College at Cambridge, and the house which was formerly a nunnery, dedicated to St. Radigund, had become so notorious for the incontinence of its inmates, that king Henry VII. and Pope Julius II. consented to its dissolution; and Alecock obtained a grant of it. Bayle calls it *spiritualium meretricium cænobium*. Bishop Alcock, wrote, 1. *Mons Perfectionis*, Lond. 1501. 2. In *Psalmos Penitentiales*. 3. *Homiliæ Vulgares*. 4. *Meditationes Piæ*. 5. *Galli Cantus ad Confratres suos Curatos in Synodo apud Barnwell, 1498*, 4to. which bears out the pun on the bishop's name by a print of his preaching with a cock on each side of him. He died in 1500.

Also, a philosopher of the second century, who wrote a treatise *De Doctrinâ Platines*, which has been edited by various learned men: the best edition is the 12mo. Oxford, 1667.

A L C O H O L.

ALCOHOL, in chemistry, ardent spirit, spirit of wine: *alcool esprit de vin*, Fr.; *weingeist*, Ger.; *spirito ardente*, *spirito de vino*, *acquarente*, Italian; in the nomenclature of modern chemistry, the purely spirituous part of all liquors that have undergone the vinous fermentation, and derived from none but such as are susceptible of it. As a chemical agent, it is of the highest importance, and in its various combinations, involving all the grand principles of the science. All fermented liquors agree in two points: a saccharine juice is necessary to the production; and they are all capable of furnishing an ardent spirit by distillation. The term, however, is commonly used to signify this spirit more or less imperfectly freed from water, in the state in which it is usually met with in the shops, and in which, as it was first obtained from the juice of the grape, it was long distinguished by the name of spirit of wine. At present it is extracted chiefly from grain or molasses in Europe, and from the juice of the sugar-cane in the West-Indies; and, in the diluted state in which it commonly occurs in trade, constitutes the basis of the several spirituous liquors, such as brandy, rum, arrack, malt-spirits, &c.: differing from each other in colour, smell, taste, and strength; but the spirituous part, to which they owe their inflammability, their hot fiery taste, and their intoxicating quality, being the same in each, may be procured in its purest state by a second distillation, which is termed, in technical language, rectification. As we are not able to compound alcohol immediately from its ultimate constituents, we have recourse to the process of fermentation, by which its principles are first extricated from the substances in which they were combined, and then united into a new compound; to distillation, by which this new compound, the alcohol, is separated in a state of dilution with water, and contaminated with essential oil;

and to rectification, by which it is ultimately freed from these. In this country, alcohol, as well as ardent spirits of different kinds, is procured most largely from fermented grain liquor, prepared, for the purpose of distillation, from wheat, barley, molasses, &c.; but in the wine countries, the spirit is obtained by the distillation of wine, whence the synonymous term, *spirit of wine*.

It appears to be essential to the fermentation of alcohol, that the fermenting fluid should contain saccharine matter, which is indispensable to that species of fermentation called vinous. In France, where a great deal of wine is made, particularly at the commencement of the vintage, which is too weak to be a saleable commodity, it is a common practice to subject this wine to distillation, in order to draw off the spirit; and, as the essential oil that rises in this process is of a more pleasant flavour than that of malt or molasses, the French brandies are preferred to any other; though even in the flavour of these there is a difference, according to the wine from which they are produced. In the West Indies a spirit is obtained from the juice of the sugar-cane, which is highly impregnated with its essential oil, and well known by the name of rum. The distillers in this country use grain or molasses, whence they distinguish the products by the name of malt spirits, and molasses spirits. It is said that a very good spirit may be extracted from the husks of gooseberries or currants, after wine has been made from them.

As the process of malting develops the saccharine principle of grain, it would appear to render it fitter for the purpose: though it is the common practice to use about three parts of raw grain with one of malt. For this two reasons may be assigned; by using raw grain the expense of malting is saved, as well as the duty on malt; and the process of malting requires some nicey-

of attention, since, if it be carried too far, part of the saccharine matter is lost, and if it be stopped too soon, this matter will soon be wholly developed. Besides, if the malt be dried too quickly, or by an unequal heat, the spirit it yields will be less in quantity, and more unpleasant in flavour. Barley appears to produce less spirit than wheat; and if three parts of raw wheat be mixed with one of malted barley, the produce is said to be particularly fine. This is the practice of the distillers in Holland for producing a spirit of the finest quality; but in England they are expressly prohibited from using more than one part of wheat to two of other grain. Rye affords still more spirit than wheat.

The practice with the distillers in Scotland, is to use one part of malted with from four to nine parts of unmalted grain; which yields an equal quantity of spirit, and at a much cheaper rate than the former proportions. The grain employed must be coarsely ground, and then mixed with a little cold water, so as to prevent its running into lumps; water about ninety degrees of Fahrenheit may then be added, till it is sufficiently diluted; and, lastly, a sufficient quantity of yeast. The whole may then be allowed to ferment in a covered vessel, to which the air can have access. If the temperature exceeds seventy-seven degrees of Fahrenheit, the fermentation will be too rapid; if it be below sixty degrees, the fermentation will cease; hence the mean between these will be found most favourable. In this country the common practice is to mash the grain as for brewing malt liquors, and to boil the wort. But if the wash or liquor intended for distillation be made from melasses and water, the fermentation must be continued till the liquor grows fine, and pungent to the taste, which will generally be about the third day, but not so long as to permit the acetous fermentation to commence.

In this state the wash is to be committed to the still, of which, including the head, it should occupy at least three-fourths; and be distilled with a gentle heat as long as any spirit comes over, which will be till about half the wash is consumed. The more slowly the distillation is conducted, the less will the spirit be contaminated with essential oil, and the less danger will there be of empyreuma. A great saving of time and fuel may be obtained by making the still very broad and shallow, and contriving a free exit for the steam. This has been carried to such a pitch in Scotland, that a still, measuring forty-three gallons, and containing sixteen gallons of wash, has been charged and worked no less than four hundred and eighty times in the space of twenty-four hours; which, if it were not established by unquestionable evidence, would appear incredible.

This wonderful rapidity of distillation has ceased since the excise duties have been levied on the quantity of spirit produced, and not, as formerly, by the size of the still. Hence, too, the spirit is probably improved in flavour.

The first product, technically termed low wine, is again to be subjected to distillation, the latter portions of what comes over, called faints, being set apart to be put into the wash still at some future operation. Thus a large portion of the

watery part is left behind. This second product, termed raw spirit, being distilled again, is called rectified spirit. It is calculated, that a hundred gallons of malt or corn wash will not produce above twenty of spirits, containing sixty parts of alcohol to fifty of water: the same of cyder wash, fifteen gallons; and of melasses wash, twenty-two gallons. The most spirituous wines of France, those of Languedoc, Guienne, and Rousillon, yield, according to Chaptal, from twenty to twenty-five gallons of excellent brandy from 100; but those of Burgundy and Champagne much less. Brisk wines, containing much carbonic acid, from the fermentation having been stopped at an early period, yield the least spirit.

The spirit thus obtained ought to be colourless, and free from any disagreeable flavour; and in this state it is fittest for pharmaceutical purposes, or the extraction of tinctures.

We shall take the example of brandy, which is the product of the first distillation of wine, and exhibit the methods by which alcohol is procured from it by rectification, to illustrate one of the most useful modes of preparing alcohol.

This spirit is a compound of alcohol, water, a colouring extractive matter, and a small quantity of oil. It is to the two last that it owes its peculiar flavor, smell, and appearance, whereby it is distinguished from other distilled spirits. The object of the process of rectification is to separate the first from the other ingredients, and this separation is effected upon the principle that alcohol is the most easily volatilized when a gentle heat is applied, and therefore appears in the first product of distillation, whilst the extractive matter and much of the water remain behind. It is more difficult, however, to get rid of the small portion of oil which brandy contains, as this is soluble in alcohol, and will rise with it in distillation, unless prevented by the means which will be presently mentioned. The observations of M. Baumé, and his directions for the preparations of alcohol, are so judicious and accurate, that we shall here mention them.

'To procure rectified alcohol,' says this able chemist, 'put a quantity of brandy in the water bath of an alembic, and proceed to distillation. Set apart the first product of the distillation when it amounts to about a fourth part of the liquor put into the alembic. Then continue the process till about as much more is obtained, or till the liquor comes over white and milky. Then re-distil the latter product, and mix the first half which comes over with the first part of the former distillation, and continue to distil as long as any spirit comes over. This latter portion may be again distilled, and the first product mixed with the former first products, as before. After each distillation, there remains in the alembic a watery liquor which retains the smell of brandy, but is entirely deprived of inflammable spirit, and is thrown away as useless. Having thus procured all the spirit from the brandy, return all the reserved first products to the alembic, and distil with a gentle fire. When about half the liquor has come over, it should be kept apart as pure rectified alcohol; the remainder is to be distilled as long as it is inflammable, and may either be

again rectified, or reserved for those purposes where a spirit of inferior strength is required. This judicious chemist gives this reason for the above process: the spirit which first passes over in distillation is the purest, and contains the least portion of gross essential oil; the latter portion, on the other hand, is almost saturated with this oil, and the difference between the two is easily distinguishable when rubbed on the hands; the first product leaves no smell of brandy, but the last gives an odour like the breath of drunkards, who digest their food imperfectly. The quantity of oil, however, varies according to the nature of the brandy; that which is made from wine alone containing the least oil, but that which is procured from wine lees being so full of it as to leave a stratum of the oil swimming on the watery extractive liquor left in the alembic, after all the spirit has been distilled off.

Dubuisson remarks, concerning this oil, that the Languedoc brandies contain much more of it than the Cognac; and that after distilling a large quantity of the former, the head of the alembic was covered with expanded drops of the oil, which adhered to the vessel. When collected together, and quite cold, they became as stiff as suet, had a chesnut colour, a strong disagreeable taste, and a smell like turpentine. Various additions have been made to the impure spirit, in order to assist in the separation of the oil. The simplest and one of the most efficacious is water. This, when added to the oily spirit, turns it milky (as is the case with any other solution of essential oil in alcohol), and, by weakening the adhesion between the oil and the spirit, it enables the latter to rise in distillation, unmixed with the former. The chief inconvenience is, that this addition weakens the strength of the spirit so much, as to require successive rectifications before it can be sufficiently deprived of its water. Bran, chalk, crumbs of bread, and other substances, are also added, before distillation, to the spirit, when oily and ill-flavoured; and they all have a good effect in keeping down the matters which contaminate the alcohol, and render the distillation more effectual in purifying it. Quicklime is still more efficacious, but much lessens the product of alcohol, alters its nature in some degree, and makes it more penetrating. It would appear, however, that there are some kinds of wine in which the odorant particles are so intimately mixed with the spirituous, that it is scarcely possible to separate them by simple distillation, however cautiously and skilfully conducted. The common still, with the worm-tube and refrigeratory, is well calculated for the rectification of spirits, only allowance must be made for the readiness with which ardent spirit, when heated, assumes the state of vapour, and the very great expansion which it then undergoes.

Alcohol, freed from all foreign ingredients but water, and already of considerable strength, may be brought to the specific gravity of 0.825, at the temperature of 60°, by a single distillation, where the heat is moderate and applied gradually, and the condensation slow. When about a third or half of the spirit is distilled over, the strength of the succeeding portion is di-

minished, the specific gravity increases, and it becomes more watery, and therefore the first product should be kept apart. This cannot be rendered stronger by any simple distillation, but it may be still further dephlegmated by means which will be mentioned hereafter.

But for ordinary sale something more is required. The brandy of France, which is most in esteem here, though perfectly colourless when first made, and often preserved so for use in that country by being kept in glass or stone bottles, is put into new oak casks for exportation, whence it soon acquires an amber colour, a peculiar flavour, and something like an unctuousness of consistence. As it is not only prized for these qualities, but they are commonly deemed essential to it, the English distiller imitates by design these accidental qualities. The most obvious and natural method of doing this would be by impregnating a pure spirit with the extractive, resinous, and colouring matter of oak shavings; but other modes have been contrived. The dulcified spirit of nitre, as it is called, is commonly used to give the flavour; and catechu, or burnt sugar, to impart the desired colour. A French writer has recommended three ounces and a half of finely powdered charcoal, and four ounces and a half of ground rice, to be digested for a fortnight in a quart of malt spirit.

The finest gin is said to be made in Holland from a spirit drawn from wheat, mixed with a third or fourth part of malted barley, and twice rectified over juniper berries; but in general rye meal is used instead of wheat. They pay so much regard to the water employed, that many send vessels on purpose to fetch it from the Meuse; but all use the softest and clearest river water they can get. In England it is the common practice to add oil of turpentine, in the proportion of two ounces to ten gallons of raw spirits, with three handfuls of bay salt, and drawn off till the farts begin to rise.

But corn, or molasses spirit, is flavoured likewise by a variety of aromatics, with or without sugar, to please different palates; all of which are included under the general technical term of compounds or cordials.

Other articles have been employed, though not generally, for the fabrication of spirit, as carrots and potatoes; and we are lately informed by professor Proust, that from the fruit of the carob tree he has obtained good brandy in the proportion of a pint from five pounds of the dried fruit.

To obtain pure alcohol, different processes have been recommended; but the purest rectified spirit, obtained as above described, being that which is least contaminated with foreign matter, should be employed. Rouelle recommends to draw off the spirit in a water bath; to rectify this twice more, drawing off two-thirds each time; to add water to this alcohol, which will turn it milky by separating the essential oil remaining in it; to distil the spirit from this water; and finally, rectify it by another distillation.

Alcohol is often dephlegmated, or still further freed from water, by means of some alkaline salt. Boerhaave recommended, for this purpose, the muriate of soda, deprived of its water of crystallization by heat, and added hot to the spirit. But

the subcarbonate of potash is preferable. About a third of the weight of the alcohol should be added to it in a glass vessel, well shaken, and then suffered to subside. The salt will be moistened by the water absorbed from the alcohol; which being decanted, more of the salt is to be added, and this is to be continued till the salt falls dry to the bottom of the vessel. The alcohol in this state will be reddened by a portion of the pure potash, which it will hold in solution, from which it must be freed by distillation in a water bath. Dry muriate of lime may be substituted advantageously for the alkali.

Alcohol, as we have already intimated, is a colourless transparent liquor, appearing to the eye like pure water. It possesses a peculiar penetrating smell, distinct from the proper odour of the distilled spirit from which it had been procured. To the taste it is excessively hot and burning, but without any peculiar flavour. From its great lightness and mobility; the bubbles, which are formed on shaking it, subside almost instantaneously, and this is one method of judging of its purity. Alcohol is very easily volatilized by the heat of the hand, it even begins to be converted into a very expansible vapour at the temperature of 55° Fahr. and the quickness of evaporation always produces a considerable cold. It boils at about 165° , and the vapours when condensed return unaltered to their former state. It has never been frozen by any cold, natural or artificial, and hence its use in thermometers to measure very low temperatures.

Alcohol takes fire very readily on the application of any lighted body, the speedier in proportion to its purity. It burns with a pale flame, white in the centre and blue at the edges; this gives but a small degree of heat, and is so faint as to be scarcely visible in bright day-light. It burns without any smoke or vapour, and if strong, leaves no residuum; but if weak, it is extinguished spontaneously, and the watery part remains behind.

As alcohol is much lighter than water, its specific gravity is adopted as the test of its purity. Fourcroy considers it as rectified to the highest point when its specific gravity is 829, that of water being 1000; and perhaps this is nearly as far as it can be carried by the process of Rouelle or Baumé simply. M. Bories found the first measure that came over from twenty of spirit at 836 to be 820, at the temperature of 71° of Fahrenheit. Sir Charles Blagden, by the addition of alkali, brought it to 813, at 60° of Fahrenheit. Chaussier professes to have reduced it to 798; but he gives 998.35 as the specific gravity of water. Lowitz asserts that he has obtained it at 791, by adding as much alkali as nearly to absorb the spirit; but the temperature is not indicated. In the shops it is about 835 or 840: according to the London College it should be 815.

It is by no means an easy undertaking to determine the strength or relative value of spirits, even with sufficient accuracy for commercial purposes. The following requisites must be obtained before this can be well done: the specific gravity of a certain number of mixtures of al-

cohol and water must be taken so near each other, as that the intermediate specific gravities may not perceptibly differ from those deduced from the supposition of a mere mixture of the fluids; the expansions or variations of specific gravity in these mixtures must be determined at different temperatures; some easy method must be contrived of determining the presence and quantity of saccharine or oleaginous matter which the spirit may hold in solution, and the effect of such solution on the specific gravity; and lastly, the specific gravity of the fluid must be ascertained by a proper floating instrument with a graduated stem, or set of weights; or, which may be more convenient, with both.

The strength of brandies in commerce is judged by the phial, or by burning. The phial proof consists in agitating the spirit in a bottle, and observing the form and magnitude of the bubbles that collect round the edge of the liquor, technically termed the bead, which are larger the stronger the spirit. These probably depend on the solution of resinous matter from the cask, which is taken up in greater quantities, the stronger the spirit. It is not difficult, however, to produce this appearance by various simple additions to weak spirits. The proof by burning is also fallacious; because the magnitude of the flame, and quantity of residue, in the same spirit, vary greatly with the form of the vessel it is burned in. If the vessel be kept cool, or suffered to become hot, if it be deeper or shallower, the results will not be the same in each case. It does not follow, however, but that manufacturers and others, may, in many instances, receive considerable information from these signs, in circumstances exactly alike, and in the course of operations wherein it would be inconvenient to recur continually to experiments of specific gravity.

The importance of this object induced the British government to employ Dr. Blagden, now Sir Charles, to institute a very minute and accurate series of experiments. Of these we shall give a summary in this place, from the Philosophical Transactions for 1790.

The first object to which the experiments were directed, was to ascertain the quantity and laws resulting from the mutual penetration of water and spirit.

All bodies in general expand by heat; but the quantity of this expansion, as well as the law of its progression, is probably not the same in any two substances. In water and spirit they are remarkably different. The whole expansion of pure spirit from 30° to 100° of Fahrenheit's thermometer is not less than 1-25th of its whole bulk at 30° ; whereas that of water, in the same interval, is only 1-145th of its bulk. The laws of their expansion are still more different than the quantities. If the expansion of quicksilver be, as usual, taken for the standard, (our thermometers being constructed with that fluid,) the expansion of spirit is, indeed, progressively increasing with respect to that standard, but not much so within the above-mentioned interval, while water kept from freezing to 30° , which may easily be done, will absolutely contract as it is heated for ten or more degrees, that is to 40° or 42° of the thermometer, and will then begin

to expand as its heat is augmented, at first slowly, and afterward gradually more rapidly, so as to observe upon the whole a very increasing progression. Now, mixtures of these two substances will, as may be supposed, approach to the less or the greater of these progressions, according as they are compounded of more spirit or more water, while their total expansion will be greater, according as more spirit enters into their composition; but the exact quantity of the expansion, as well as the law of progression, in all of them, can be determined only by trials. These were, therefore, the two other principal objects to be ascertained by experiment.

The person engaged to make these experiments was Dr. Dollfuss, an ingenious Swiss gentleman then in London, who had distinguished himself by several publications on chemical subjects. As he could not conveniently get the quantity of spirit he wanted lighter than 825, at 60° Fahrenheit, he fixed upon this strength as the standard for alcohol.

These experiments of Dr. Dollfuss were repeated by Mr. Gilpin, clerk of the Royal Society; and as the deductions in this account will be taken chiefly from that last set of experiments, it is proper here to describe minutely the method observed by Mr. Gilpin in his operation. This naturally resolves itself into two parts: the way of making the mixtures, and the way of ascertaining their specific gravity.

1. The mixtures are made by weight, as the only accurate method of fixing the proportions. In fluids of such very unequal expansions by heat as water and alcohol, if measures had been employed, increasing or decreasing in regular proportions to each other, the proportions of the masses would have been sensibly irregular: now the latter was the object in view, namely to determine the real quantity of spirit in any given mixture, abstracting the consideration of its temperature. Besides, if the proportions had been taken by measure, a different mixture should have been made at every different degree of heat. But the principal consideration was, that with a very nice balance, such as was employed on this occasion, quantities can be determined to much greater exactness by weight than by any practicable way of measurement. The proportions were therefore always taken by weight. A phial being provided of such a size as that it should be nearly full with the mixture, was made perfectly clean and dry, and being counterpoised, as much of the pure spirit as appeared necessary was poured into it. The weight of this spirit was then ascertained, and the weight of distilled water required to make a mixture of the intended proportions was calculated. This quantity of water was then added, with all the necessary care, the last portions being put in by means of a well-known instrument, which is composed of a small dish terminating in a tube drawn to a fine point: the top of the dish being covered with the thumb, the liquor in it is prevented from running out through the tube by the pressure of the atmosphere, but instantly begins to issue by drops, or a very small stream, upon raising the thumb. Water being thus introduced into the phial, till

it exactly counterpoised the weight, which having been previously computed, was put into the opposite scale, the phial was shaken, and then well stopped with its glass stopple, over which leather was tied very tight to prevent evaporation. No mixture was used till it had remained in the phial at least a month, for the full penetration to have taken place; and it was always well shaken before it was poured out to have its specific gravity tried.

2. There are two common methods of taking the specific gravity of fluids; one by finding the weight which a solid body loses by being immersed in them; the other, by filling a convenient vessel with them, and ascertaining the increase of weight it acquires. In both cases a standard must have been previously taken, which is usually distilled water; namely, in the first method, by finding the weight lost by the solid body in the water; and in the second method, the weight of the vessel filled with water. The latter was preferred, for the following reasons:—

When a ball of glass, which is the properst kind of solid body, is weighed in any spirituous or watery fluid, the adhesion of the fluid occasions some inaccuracy, and renders the balance comparatively sluggish. To what degree this effect proceeds is uncertain; but from some experiments made by Mr. Gilpin with that view, it appears to be very sensible. Moreover, in this method, a large surface must be exposed to the air during the operation of weighing, which, especially in the higher temperatures, would give occasion to such an evaporation as to alter essentially the strength of the mixture. It seemed also as if the temperature of the fluid under trial could be determined more exactly in the method of filling a vessel, than in the other: for the fluid cannot well be stirred while the ball to be weighed remains immersed in it; and, as some time must necessarily be spent in the weighing, the change of heat which takes place during that period will be unequal through the mass, and may occasion a sensible error. It is true, on the other hand, that in the method of filling a vessel, the temperature could not be ascertained with the utmost precision, because the neck of the vessel employed, containing about ten grains, was filled up to the mark with spirit not exactly of the same temperature, as will be explained presently: but this error, it is supposed, would by no means equal the other, and the utmost quantity of it may be estimated very nearly. Finally, it was much easier to bring the fluid to any given temperature when it was in a vessel to be weighed, than when it was to have a solid body weighed in it; because in the former case the quantity was smaller, and the vessel containing it more manageable, being readily heated with the hand or warm water, and cooled with cold water: and the very circumstance, that so much of the fluid was not required, proved a material convenience. The particular disadvantage in the method of weighing in a vessel, is the difficulty of filling it with extreme accuracy; but when the vessel is judiciously and neatly marked, the error of filling, will, with due care, be exceedingly minute. By several repetitions

of the same experiments, Mr. Gilpin seemed to bring it within the 1-15000th part of the whole weight.

The above-mentioned considerations induced Dr. Blagden, as well as the gentlemen employed in the experiments, to give the preference to weighing the fluid itself; and that was accordingly the method practised both by Dr. Dollfuss and Mr. Gilpin in their operations.

The vessel chosen as most convenient for the purpose was a hollow glass ball, terminating in a neck of small bore. That which Dr. Dollfuss used held 5800 grains of distilled water; but as the balance was so extremely accurate, it was thought expedient, upon Mr. Gilpin's repetition of the experiments, to use one of only 2965 grains capacity, as admitting the heat of any fluid contained in it to be more nicely determined. The ball of this vessel, which may be called the weighing bottle, measured about 2.8 inches in diameter, and was spherical, except a slight flattening on the part opposite to the neck, which served as a bottom for it to stand upon. Its neck was formed of a portion of a barometer tube, .25 of an inch in bore, and about $1\frac{1}{2}$ inch long; it was perfectly cylindrical, and, on its outside, very near the middle of its length, a fine circle or ring was cut round it with a diamond, as the mark to which it was to be filled with the liquor. This mark was made by fixing the bottle in a lathe, and turning it round with great care, in contact with the diamond. The glass of this bottle was not very thick; it weighed 916 grains, and with its silver cap 936.

When the specific gravity of any liquor was to be taken by means of this bottle, the liquor was first brought nearly to the required temperature, and the bottle was filled with it up to the beginning of the neck only, that there might be room for shaking it. A very fine and sensible thermometer was then passed through the neck of the bottle into the contained liquor, which showed whether it was above or below the intended temperature. In the former case the bottle was brought into colder air, or even plunged for a moment into cold water; the thermometer in the mean time being frequently put into the contained liquor, till it was found to sink to the right point. In like manner, when the liquor was too cold, the bottle was brought into warmer air, immersed in warm water, or more commonly held between the hands, till upon repeated trials with the thermometer the just temperature was found. It will be understood, that during the course of this heating or cooling, the bottle was very frequently shaken between each immersion of the thermometer; and the top of the neck was kept covered, either with the finger, or a silver cap made on purpose, as constantly as possible. Hot water was used to raise the temperature only in heats of 80° and upwards, inferior heats being obtained by applying the hands to the bottle: when the hot water was employed, the ball of the bottle was plunged into it, and again quickly lifted out, with the necessary shaking interposed, as often as was necessary for communicating the required heat to the liquor; but care was taken to wipe the bottle dry after each immersion, be-

fore it was shaken, lest any adhering moisture might by accident get into it. The liquor having by these means been brought to the desired temperature, the next operation was to fill up the bottle exactly to the mark upon the neck, which was done by some of the same liquor, by means of a glass funnel with a very small bore. Mr. Gilpin endeavoured to get that portion of the liquor which was employed for this purpose, pretty nearly to the temperature of the liquor contained in the bottle; but, as the whole quantity to be added never exceeded ten grains, a difference of ten degrees in the heat of that small quantity, which is more than it ever amounted to, would have occasioned an error of only 1-30th of a degree in the temperature of the mass. Enough of the liquor was put in to fill the neck rather above the mark, and the superfluous quantity was then absorbed to great nicety, by bringing into contact with it the fine point of a small roll of blotting paper. As the surface of the liquor in the neck would be always concave, the bottom or centre of this concavity was the part made to coincide with the mark round the glass; and in viewing it, care was taken that the near and opposite sides of the mark should appear exactly in the same line, by which means all parallax was avoided. A silver cap, which fitted tight, was then put upon the neck to prevent evaporation; and the whole apparatus was in that state laid in the scale of the balance, to be weighed with all the exactness possible.

The spirit employed by Mr. Gilpin was furnished to him by Dr. Dollfuss, under whose inspection it had been rectified from rum supplied by government. Its specific gravity, at 60 degrees of heat, was .82514. It was first weighed pure, in the above-mentioned bottle, at every five degrees of heat from 30 to 100 inclusively. Then mixtures were formed of it and distilled water, in every proportion, from 1-20th of the water to equal parts of water and spirit; the quantity of water added being successively augmented, in the proportion of five grains to one hundred of the spirit; and these mixtures were also weighed in the bottle, like the pure spirit, at every five degrees of heat. The numbers hence resulting are delivered in the following table; where the first column shows the degrees of heat; the second gives the weight of the pure spirit contained in the bottle at those different degrees; the third gives the weight of a mixture in the proportions of 100 parts by weight of that spirit to 5 of water, and so on successively till the water is to the spirit as 100 to 5. They are the mean of three several experiments at least, as Mr. Gilpin always filled and weighed the bottle over again that number of times, if not oftener. The heat was taken at the even degree, as shewn by the thermometer, without any allowance in the first instance, because the coincidence of the mercury with a division can be perceived more accurately than any fraction can be estimated; and the errors of the thermometers, if any, it was supposed would be less upon the grand divisions of 5 degrees than in any others. It must be observed, that Mr. Gilpin used the same mixture throughout all the different temperatures, heating

it up from 30° to 100°; hence some small error in its strength may have been occasioned in the higher degrees, by more spirit evaporating than water: but this, it is believed, must have been trifling, and greater inconvenience would probably have resulted from interposing a fresh mixture.

The precise specific gravity of the pure spirit employed was .82514; but to avoid an incon-

venient fraction, it is taken, in constructing the table of specific gravities, as .825 only, a proportional deduction being made from all the other numbers. Thus the following table gives the true specific gravity, at the different degrees of heat, of a pure rectified spirit, the specific gravity of which at 60° is .825, together with the specific gravities of different mixtures of it with water, at those different temperatures.

REAL SPECIFIC GRAVITY AT THE DIFFERENT TEMPERATURES.

Heat.	The pure spirit.	100 grains of spirit to 5 gr. of water.	100 grains of spirit to 10 gr. of water.	100 grains of spirit to 15 gr. of water.	100 grains of spirit to 20 gr. of water.	100 grains of spirit to 25 gr. of water.	100 grains of spirit to 30 gr. of water.	100 grains of spirit to 35 gr. of water.	100 grains of spirit to 40 gr. of water.	100 grains of spirit to 45 gr. of water.	100 grains of spirit to 50 gr. of water.

From this table, when the specific gravity of any spirituous liquor is ascertained, it will be easy to find the quantity of rectified spirit of the above-mentioned standard, contained in any given quantity of it, either by weight or measure.

Dr. Blagden concludes this part of the report with observing, that as the experiments were made with pure spirit and water, if any extraneous substances are contained in the liquor to be tried, the specific gravity in the tables will not give exactly the proportions of water and spirit in it. The substances likely to be found in spirituous liquors, where no fraud is suspected, are essential oils, sometimes empyreumatic, mucilaginous, or extractive matter, and perhaps some saccharine matter. The effect of these, in the course of trade, seems to be hardly such as would be worth the cognizance of the excise, nor could it easily be reduced to certain rules. Essential and empyreumatic oils are nearly of the same specific gravity as spirit, in general rather lighter, and therefore, notwithstanding the actual penetration, will probably make little change in the specific gravity of any spirituous liquor in which they are dissolved. The other substances are all heavier than spirit; the specific gravity of common gum being 1.482, and of sugar 1.063, according to the tables of M. Brisson. The effect of them therefore will be to make spirituous liquors appear less strong than they really are. An idea was once entertained of endeavouring to determine this matter with some precision; and accordingly Dr. Dollfuss evaporated 1000 grains of brandy, and the same quantity of rum, to dryness; the former left a residuum of 40 grains, the latter only of $8\frac{1}{2}$ grains. The 40 grains of residuum from the brandy, dissolved again in a mixture of 100 of spirit, with 50 of water, increased its specific gravity .00041; hence the effect of this extraneous matter upon the specific gravity of the brandy containing it, would be to increase the fifth decimal by six nearly, equal to what would indicate, in the above-mentioned mixture, about one seventh of a grain of water more than the truth, to 100 of spirit; a quantity much too minute for the consideration of government.

The strength of spirit is determined, according to law, by Sykes's hydrometer; but as many

dealers use Dicas's, we shall describe it here, and the former under DISTILLATION.

It consists of a light copper ball, terminating below with a ballast bottom, and above with a thin stem, divided into ten parts. The upper extremity of the stem is pointed, to receive the little brass poises, or discs, having each a hole in its centre. These poises are numbered 0, 10, 20, 30, &c. up to 350, which is the lightest of the series. The intermediate units are given by the subdivisions on the stem. A graduated ivory scale, with a sliding rule and thermometer, accompanies the hydrometer, to make the correction of temperature. The first thing in using this instrument is to plunge the thermometer into a glass cylinder containing the spirits to be tried. The sliding rule has then the degree of temperature indicated, moved opposite to zero. The hydrometer is now placed in the liquid, and such a poise is put on as to submerge a portion of the stem. The weight, added to the number on the stem, gives a sum, opposite to which on the scale we find a quantity by which the particular spirit may exceed or fall short of proof. Thus, if it mark 20 under proof, it signifies that every 100 gallons of that spirit would require to have 20 gallons of water abstracted from it to bring it up to proof. If it mark 10 over proof, we learn that every 100 gallons contain too little water by 10 gallons. When the thermometric degree of 60° is put opposite to zero, then the weights and value of the spirits have the following relations on the scale.

102.5	denotes 20 under proof
122.0	10
143.5	Proof
167.	10 over proof
193.	20
221.	30 over proof
251.	40
284.5	50
322.5	60
350.5	Alcohol.

There is, besides, an upper line on the scale which exhibits the relation of spirit to water reckoned unity. Thus, above 10 per cent over proof in the second line, we find in the upper line 8. From which we learn, that 8 of that spirit by bulk, will take 1 of water to bring it down to proof. At 60° Fah. we find that 10 over

proof, on Dicas, corresponds to specific gravity 0.9085.

$\frac{3}{4}$ over proof to 0.9169
Proof, 0.9218.

Now, by Gilpin's tables, this indicates a compound of 100 grains of alcohol 0.825, and 85 grains of water. But by Lowitz's table in Crell's Annals, the above specific gravity corresponds to 48 alcohol of 0.791 at the temperature of 68°, united to 52 of water, and cooled down to 60.

Equal weights of that strong alcohol and water, give at 60°, a specific gravity of 0.9175. By the Act of Parliament of 1762, the specific gravity of proof was fixed at 0.916. It is at present to water as 12 to 13, or = 0.923. See DISTILLATION.

For the following table of the quantity of absolute alcohol, in spirits of different densities, we are indebted to Lowitz.

The most remarkable characteristic property of alcohol, is its solubility or combination in all proportions with water, a property possessed by no other combustible substance, except the acetic spirit obtained by distilling the dry acetates. When it is burned in a chimney which communicates with the worm-pipe of a distilling apparatus, the product, which is condensed, is found to consist of water, which exceeds the spirit in weight about one-eighth part; or more accurately, 100 parts of alcohol, by combustion, yield 136 of water. If alcohol be burned in close vessels with vital air, the product is found

to be water and carbonic acid. Whence it is inferred that alcohol consists of hydrogen, united either to carbonic acid, or its acidifiable base; and that the oxygen uniting on the one part with the hydrogen, forms water; and on the other with the base of the carbonic acid forms that acid.

The most exact experiments on this subject are those recently made by M. de Saussure. The alcohol he used had, at 62.8°, a specific gravity of 0.8302; and by Richter's proportions, consists of 13.8 water, and 86.2 of absolute alcohol. The vapour of alcohol was made to traverse a

narrow porcelain tube ignited, from which the products passed along a glass tube about six feet in length, refrigerated by ice. A little charcoal was deposited in the porcelain, and a trace of oil in the glass tube. The resulting gas being analyzed in an exploding eudiometer, with oxygen, was found to resolve itself into carbonic acid and water. Three volumes of oxygen disappeared for every two volumes of carbonic acid produced: a proportion which obtains in the analysis by oxygenation of olefiant gas. Now, as nothing resulted but a combustible gas of this peculiar constitution, and condensed water equal to $\frac{100}{114}$ of the original weight of the alcohol, we may conclude that vapour of water and olefiant gas are the sole constituents of alcohol. Subtracting the 13.8 per cent of water in the alcohol at the beginning of the experiment, the absolute alcohol of Richter will consist of 13.7 hydrogen, 51.98 carbon, and 34.32 oxygen. M. Gay Lussac infers, that alcohol, in vapour, is composed of one volume of olefiant gas, and one volume of the vapour of water, condensed by chemical affinity into one volume.

The sp. gr. of olefiant gas is	0.97804
Of aqueous vapour is	0.62500

Sum = 1.60304

And alcoholic vapour is = 1.6133

These numbers approach nearly to those which would result from two prime equivalents of olefiant gas, combined with one of water; or ultimately, three of hydrogen, two of carbon, and one of oxygen.

A considerable number of the uses of this fluid, as a menstruum, will pass under our observation in the various articles of this work. The mutual action between alcohol and acids produces a light, volatile, and inflammable substance, called aether. Pure alkalis unite with spirit of wine,

He also accompanies the relation of his experiments with many judicious reflections.

The alcohol he employed in these above mentioned, had a specific gravity of 0.840. Alcohol affords frequently a valuable agent for separating salts from each other. We shall therefore introduce the following additional table, derived from the experiments of Wenzel:—

and form alkaline tinctures. Few of the neutral salts unite with this fluid, except such as contain ammonia. The carbonated fixed alkalis are not soluble in it.

From the strong attraction which exists between alcohol and water, it unites with this last in saline solutions, and in most cases precipitates the salt. This is a pleasing experiment, which never fails to surprise those who are unacquainted with chemical effects. If, for example, a saturated solution of nitre in water be taken, and an equal quantity of strong spirit of wine be poured upon it, the mixture will constitute a weaker spirit, which is incapable of holding the nitre in solution; it therefore falls to the bottom instantly, in the form of minute crystals.

The degrees of solubility of many neutral salts in alcohol have been ascertained by experiments made by Macquer, of which an account is published in the memoirs of the Turin Academy.—The alcohol he employed was carefully freed from superabundant water by repeated rectifications, without addition of any intermediate substance. The salts employed in his experiments were previously deprived of their water of crystallization by a careful drying. He poured into a matress, upon each of the salts thus prepared, half an ounce of his alcohol, and set the matress in a sand bath. When the spirit began to boil, he filtrated it while it was hot, and left it to cool, that he might observe the crystallizations which took place. He then evaporated the spirit, and weighed the saline residuums. He repeated these experiments a second time, with this difference, that instead of evaporating the spirit in which the salt had been digested, he set fire to it in order to examine the phenomena which its flame might exhibit. The principal results of his experiments are subjoined.

Peculiar phenomena of the flame.

It appears from the experiments of Kirwan, that dried muriate of magnesia dissolves more abundantly in strong than in weak alcohol. 100 parts of specific gravity 0.900 dissolve 21.25 ; of 0.848, 23.75 ; of 0.834, 36.25 ; and of 0.817, 50 parts. The same holds to a more limited extent with acetate of lime, 2.4 grains being soluble in 100 of the first alcohol, and 4.88 in 100 of the last. The other salts which he tried dissolved more sparingly in the stronger than in the weaker alcohol. The temperature of the spirit was generally 60°.

All deliquescent salts are soluble in alcohol. Alcohol holding the strontitic salts in solution, gives a flame of a rich purple. The cupreous salts and boracic acid give a green ; the soluble calcareous, a reddish ; the barytic, a yellowish. For the effect of other salts on the colour of flame, see a preceding table.

Kirwan also, with that accuracy which has distinguished him, has given a table of the solubility of certain salts, by means of alcohol of different densities. In these the temperature is properly noticed—

Salts employed, all deprived of their water of crystallization.	Soluble in 100 grains of Alcohol of different specific gravity.—Heat, from 50°. to 70°.

The alcohol of 0.825 has been subjected to a cold of — 91° without congealing. But Mr. Hutton has given, in the Edinburgh Encyclopædia, article Cold, an account of his having succeeded in solidifying it by a cold of — 110°. The alcohol he employed had a density of 0.798 at 60°. His process has been kept secret. The boiling point of alcohol of 0.825 is 176°. Alcohol of 0.810 boils at 173°.5. For the force of its vapour at different temperatures, and its specific heat, see CALORIC, and the Tables of VAPOUR.

When potassium and sodium are put in contact with the strongest alcohol, hydrogen is evolved. When chlorine is made to pass through alcohol in a Woolfe's apparatus, there is a mutual action. Water, an oily looking substance, muriatic acid, a little carbonic acid, and carbona-

ceous matter, are the products. This oily substance does not redden turnsole, though its analysis by heat shews it to contain muriatic acid. It is white, denser than water, has a cooling taste analogous to mint, and a peculiar, but not an ethereous odour. It is very soluble in alcohol, but scarcely in water. The strongest alkalis hardly operate on it.

It was at one time maintained, that alcohol did not exist in wines, but was generated and evolved by the heat of distillation. On this subject M. Gay Lussac made some decisive experiments. He agitated wine with litharge in fine powder, till the liquid became as limpid as water, and then saturated it with subcarbonate of potash. The alcohol immediately separated and floated on the top. He distilled another portion of wine in vacuo, at 59° Fahr. a temperature

considerably below that of fermentation. Alcohol came over. Mr. Brande proved the same position by saturating wine with subacetate of lead, and adding potash.

MM. Adam and Duportal have substituted for the redistillations used in converting wine or beer into alcohol, a single process of great elegance. From the capital of the still a tube is led into a large copper recipient. This is joined by a second tube to a second recipient, and so on through a series of four vessels, arranged like a Woolfe's apparatus. The last vessel communicates with the worm of the first refrigeratory.—This, the body of the still, and the two recipients nearest it, are charged with the wine or fermented liquor. When ebullition takes place in the still, the vapour issuing from it soon communicates the boiling temperature to the liquor in the two recipients. From these the volatilized alcohol will rise and pass into the third vessel, which is empty. After communicating a certain heat to it, a portion of the finer or less condensable spirit will pass into the fourth, and thence, in a little, into the worm of the first refrigeratory. The wine round the worm will likewise acquire heat, but more slowly. The vapour that in that event may pass uncondensed through the first worm, is conducted into a second, surrounded with cold water. Whenever the still is worked off, it is replenished by a stop-cock from the nearest recipient, which, in its turn, is filled from the second, and the second from the first worm-tub. It is evident, from this arrangement, that by keeping the third and fourth recipients at a certain temperature, we may cause alcohol, of any degree of lightness, to form directly at the remote extremity of the apparatus. The utmost economy of fuel and time is also secured, and a better flavoured spirit is obtained. The arrière gout of bad spirit can scarcely be destroyed by infusion with charcoal and redistillation. In this mode of operating, the taste and smell are excellent from the first. Several stills on the above principle have been constructed at Glasgow, for the West India distillers, and have been found extremely advantageous. The excise laws do not permit their employment in the home trade.

If sulphur in sublimation meet with the vapour of alcohol, a very small portion combines with it, which communicates a hydro-sulphurous smell to the fluid. The increased surface of the two substances appears to favour the combination. It had been supposed, that this was the only way in which they could be united; but M. Favre has lately asserted, that having digested two drams of flower of sulphur in an ounce of alcohol, over a gentle fire not sufficient to make it boil, for twelve hours, he obtained a solution that gave twenty-three grains of precipitate. A similar mixture left to stand for a month in a place exposed to the solar rays, afforded sixteen grains of precipitate; and another, from which the light was excluded, gave thirteen grains. It alcohol be boiled with one-fourth of its weight of sulphur for an hour, and filtered hot, a small quantity of minute crystals will be deposited on cooling; and the clear fluid will assume an opaque hue on being diluted with an equal quantity of water, in which state it will pass the filter, nor

will any sediment be deposited for several hours. The alcohol used in the last-mentioned experiment did not exceed .840.

Phosphorus is sparingly soluble in alcohol, but in greater quantity by heat than in cold. The addition of water to this solution affords an opaque milky fluid, which gradually becomes clear by the subsidence of the phosphorus.

Earths seem to have scarcely any action upon alcohol. Quicklime, however, produces some alteration in this fluid, by changing its flavour, and rendering it of a yellow colour. A small portion is probably taken up.

Soaps are dissolved with great facility in alcohol, with which they combine more readily than with water. None of the metals, or their oxides, are acted upon by this fluid. Resins, essential oils, camphor, bitumen, and various other substances, are dissolved with great facility in alcohol, from which they may be precipitated by the addition of water. From its property of dissolving resins, it becomes the menstruum of one class of varnishes. See VARNISH.

Camphor is not only extremely soluble in alcohol, but assists the solution of resins in it. Fixed oils, when rendered drying by metallic oxides, are soluble in it, as well as when combined with alkalies.

Wax, spermaceti, biliary calculi, urea, and all the animal substances of a resinous nature, are soluble in alcohol; but it curdles milk, coagulates albumen, and hardens the muscular fibre and coagulum of the blood.

The uses of alcohol are various. As a solvent of resinous substances and essential oils, it is employed both in pharmacy and by the perfumer. When diluted with an equal quantity of water, constituting what is called proof spirit, it is used for extracting tinctures from vegetable and other substances, the alcohol dissolving the resinous parts, and the water the gummy. From giving a steady heat without smoke when burnt in a lamp, it was formerly much employed to keep water boiling on the tea-table. In thermometers for measuring great degrees of cold, it is preferable to mercury, as we cannot bring it to freeze. It is in common use for preserving many anatomical preparations, and certain subjects in natural history; but to some it is injurious, the molluscae for instance, the calcareous covering of which it in time corrodes. It is of considerable use too in chemical analysis, as appears under the different articles to which it is applicable.

From the great expansive power of alcohol, it has been made a question, whether it might not be applied with advantage in the working of steam-engines. From a series of experiments made by Betancourt, it appears, that the steam of alcohol has, in all cases of equal temperature, more than double the force of that of water; and that the steam of alcohol at 174° Fahr. is equal to that of water at 212°: thus there is a considerable diminution of the consumption of fuel, and where this is so expensive as to be an object of great importance, by contriving the machinery so as to prevent the alcohol from being lost, it may possibly at some future time be used with advantage, if some other fluid of great ex-

pansive power, and inferior price, be not found more economical.

It remains for us to mention the chemical nature of alcohol, and the appearances which attend its decomposition. The remarkable circumstance of a vegetable product burning away, without the smallest trace of smoke or fuliginous vapour of any kind, had long engaged the attention of chemists. Junker and Boerhaave threw much light on the subject by remarking, that the product of the combustion of alcohol was always a quantity of pure water; and this fact was more fully illustrated by the experiments of the illustrious Lavoisier. The ready evaporation of alcohol, and the ease with which its vapour will fill a large vessel, renders it a dangerous experiment to submit a considerable quantity at once to combustion, in oxygen gas confined in any vessel; but this difficulty was surmounted in an ingenious manner. His first experiment was simply to ascertain the quantity of water yielded by the combustion of a given weight of alcohol. This was performed in the following apparatus, contrived by M. Meusnier. See CHEMISTRY, plate I. fig. 1.

E is a worm, contained in the cooler ABCD. To the upper part of the worm E, the chimney G H is fixed, which is composed of two tubes, one within the other, the inner of which is a continuation of the worm, the outer one is a case of tin plate, which surrounds it at about an inch distance, and the interval is filled with sand. At the inferior extremity K of the inner tube, a glass tube is fixed, to which is adapted the Argand lamp L M, for burning alcohol.

Things being thus disposed, and the lamp being filled with a determined quantity of alcohol, it is set on fire; the water which is formed during combustion rises in the chimney K E, and, being condensed in the worm, runs out at its extremity, F, into the bottle P. The use of the outer tube G H, and of the sand between it and the inner tube, is to prevent the latter, which proceeds from the worm, from being cooled during combustion, which would occasion the water, formed by the burning, to fall back on the lamp, instead of passing on into the worm.

This apparatus, though not perfect, has the advantage of enabling the chemist to operate with larger quantities than can be admitted in the more accurate experiments on combustion, and by it, the above mentioned chemists were able to establish the important fact, that the quantity of water collected by the combustion of alcohol very sensibly exceeds the quantity of the alcohol which is consumed. The product of water must vary according to the strength of the alcohol, and the care of conducting the experiment; but it is so considerable, that from sixteen ounces of ardent spirit, Lavoisier obtained eighteen ounces and a half of pure water.—There is besides, however, a large quantity of carbonic acid produced in this experiment which escapes, and cannot be estimated by this apparatus. Some of this gas unites with the water which is collected, and causes it to precipitate lime-water.

Having thus ascertained in a general way the products of the combustion of alcohol, Lavoisier

proceeded to repeat the experiment, in vessels which might determine the result with accuracy. He employed, for this purpose, a large bell glass, holding from 700 to 800 cubic inches, and inverted over a mercurial trough. A small lamp, filled with a known weight of alcohol, was introduced under the glass, swimming on the surface of the mercury, and the wick was armed with a very minute portion of phosphorus. The atmospheric air within the glass was sucked out by a syphon, till the mercury rose to a certain height which was noted; and the phosphorus on the wick being then kindled by a hot iron, the spirit soon took fire. As the air within the glass would be soon consumed, and the inflammation of the spirit stopped, a constant supply of oxygen gas was sent into the glass through a syphon tube, connected with a reservoir of this gas, and which passed under the mercury into the glass where the combustion was going on. Great precaution was required not to let in more oxygen than was barely necessary to keep up the combustion; otherwise the heat, volatilizing part of the spirit, would have filled the glass with vapour of alcohol, and this mixing with the oxygen, would have suddenly exploded by the combustion. In this, as in other respects, the combustion of alcohol strikingly resembles that of pure hydrogen gas. The experiment was at last stopped by the quantity of carbonic acid generated; and on examining the results, (proper corrections being made for pressure and temperature) it was found, that 93.5 grains of alcohol and 110.32 grains of oxygen had been consumed. The products of these were 93.8 grains of carbonic acid and 106.2 grains of water, which last, therefore, exceeded by 12.7 grains the quantity of alcohol employed. From these data, and from previous experiments (wherein Lavoisier estimated, that 100 grains of oxygen take up 38.88 grains of carbon, for the production of carbonic acid gas; and that the same quantity of oxygen takes up 17.64 grains of hydrogen for the production of water,) he concluded the composition of alcohol to be the following:

Carbon	28.5	3
Hydrogen	7.8	7
Water already existing in the alcohol	63.	6

100

We may observe, however, that the result of this experiment can only be considered as an approximation towards the truth, since the estimation of the component parts of alcohol here given, does not agree with that which is deduced by the same chemist, from the result of vinous fermentation. Neither is there any light thrown on the mode of union between the component parts, and their degree of oxygenation as they exist in the spirit before combustion.

Alcohol has likewise been more directly decomposed without the accession of oxygen gas. Dr. Priestley procured inflammable air by passing the electric spark through spirit of wine. But the most striking experiments on this subject, performed by this excellent philosopher, were the decomposition of spirit by passing it through red-hot tubes, both of earth and metal. He first transmitted two ounce measures of al-

cohol, reduced to vapour by boiling, through an ignited porcelain tube, and procured 1900 ounce measures of air, 'which was all inflammable without any mixture of fixed air in it, and which burned with a blue lambent flame.' (We here quote the very words of the author, which the writer of the article *ALCOOL*, in the Encyclopedie Methodique, has made to correspond with the experiments of Lavoisier, by adopting the following singular translation:—M. Priestley, en faisant passer de l'alcoo dans un tube d'argile rougi au feu, en a retire du gas hydrogene mélé de gaz acide carbonique.) Dr. Priestley's next experiments are still more curious, as they determine the existence of carbonaceous matter in spirit of wine. Having found interesting results from the transmission of the vapour of water through a heated copper tube, he repeated the experiments, only substituting the vapour of spirit of wine for that of water. 'In this case,' he observes, 'the vapour of the spirit had no sooner entered the hot copper tube, than I was perfectly astonished at the rapid production of air. It resembled the blowing of bellows. But I had not used four ounces of the spirit of wine before I very unexpectedly found that the tube was perforated in several places, and presently afterwards it was so far destroyed, that in attempting to remove it from the fire, it actually fell in pieces. The inside was full of a black sooty matter, resembling lamp-black.' He then varied the experiment by using earthen tubes, placing within them copper filings, and transmitting the vapour of alcohol. The copper was, as before, converted into a black friable substance, obviously produced by the addition of carbonaceous matter furnished by one part of the spirit, whilst the other part appeared in the form of a copious stream of inflammable air. It is, however, by no means the whole of the charcoal of the alcohol which is detained by the copper, for much of it escapes mixed with the inflammable air in the form of fine soot, giving the gas the appearance of a dense black cloud; and when the tube is strongly heated, this volatilized charcoal will give an uniform black coating to any balloon or large vessel in which the gas is received. Dr. Priestley found some other metals to undergo a similar change by the vapour of alcohol, but none in so striking a manner as copper. On heating some of this charcoal of copper, as he calls it, in oxygen gas, he found it to burn very readily to a certain point, after which the remainder could not be again kindled. The gas produced by the combustion was pure fixed air or carbonic acid.

The excellent Dutch chemists, of the Teylerian institution, Van Marum and colleagues, repeated Dr. Priestley's experiments with great accuracy, and found the same results in every essential particular. They employed, as well as Dr. Priestley, Wedgwood's porcelain tubes, which they inclosed in iron tubes to prevent the sudden action of the fire which is apt to crack them. One extremity of the earthen tube received a small retort in which was put the alcohol, and the other entered a metallic serpentine tube, immersed in a refrigeratory, and provided at the further end with a bottle to receive the

gaseous products. In the first experiment which was performed, an ounce and a half of alcohol in vapour had been transmitted through the heated copper, and had produced about six cubic feet of inflammable air.

In the second experiment the heat was greater, and the productions of the gas more rapid. In all, the copper was reduced to a black and very friable substance, which fell to pieces between the fingers. The proportion of charcoal added to the copper by the experiments, varied at different times, apparently owing to the greater or less rapidity with which the process was conducted. Dr. Priestley had united 446 grains of charcoal to twenty-eight of copper, in one instance; and 508 to nineteen, in another; but the Dutch chemists found a much less proportion of charcoal, being only an addition of 292 grains to 748 of copper in one case, and in another, 180 of charcoal to 612 of the metal. The great difference in the result is, however, of little consequence in attempting to ascertain by these experiments the exact proportion of the component parts of alcohol, since a large part of the carbonaceous ingredient escapes the copper, and passes over into the vessels which receive the inflammable air, where it either appears in the form of a fine black soot, or remains permanently united with the hydrogen gas. M. Van Marum likewise collected, in the bottle connected with the serpentine, a quantity of nearly pure water, about equal to half the weight of the alcohol evaporated by boiling, and of the specific gravity of .996. He does not inform us of the strength of the spirit which he used. He confirmed the other part of Dr. Priesley's experiment by burning the charcoal of copper in oxygen gas, and procuring pure carbonic acid, whilst the remaining copper still retained a small portion of carbon which could not be consumed. It is worthy of remark, that the inflammable air, produced in the experiments of both these eminent chemists, was found to be not more than twice as light as common air, and it probably bears a considerable resemblance to that species of gas, termed, with great propriety, by Mr. Cruikshank, gaseous oxyd of carbon.

The vapour of alcohol transmitted through earthen tubes, forms, in particular circumstances, that singular air which has been named olefiant gas. It possesses in the highest degree the cordial, stimulating, and intoxicating qualities, of all distilled spirits, and although the less powerful and more grateful of the spirituous liquors, such as rum, brandy, &c. are more peculiarly devoted to the use of the table, the purer ardent spirit, again sufficiently diluted with water, is employed as the basis of many of the artificial cordial spirits and liquors, to which a flavour and additional taste are given by particular admixtures. Its use in medicine as a solvent for the more active parts of vegetables, under the form of tinctures, has already been mentioned; it is also employed as an external application, often with considerable success.

The highly antiseptic power of alcohol which renders it so valuable in preserving particular parts of the body, as anatomical preparations, is of great importance; as also the gentle, steady,

and uniform heat which it gives during combustion, and the absence of smoke or fuliginous vapour, which make it often a most eligible material for burning in lamps. Its uses in these respects have already been mentioned; but as a fluid for thermometers, though it has the advantage over mercury in not freezing in any known degree of cold, yet from its ready volatility in a moderate heat it cannot be depended on with any accuracy, above ninety or 100 degrees.

We refer the reader to the articles FERMENTATION, (vinous and otherwise,) DISTILLATION, and the several species of distilled spirits; in which the formation of alcohol in its progressive stages will be more fully developed.

ALCONOT, is also a fine, impalpable powder, used by the ladies of the East as a kind of fucus. Kohol is the generic name for a substance applied to the eye-ball, on the inside of the eye-lids, in the form of a finely levigated powder. That which is employed for ornament is called al kohol or isphahany; when other ingredients, as flowers of olibanum, amber, and the like, are added, on account of some particular disorders, the kohol is distinguished by some appropriate epithet. Dr. Shaw says, that none of the women in Barbary think themselves completely dressed, until they have tinged their hair and edges of their eye-lids with al-ka-hol, the powder of lead-ore. Lady Montague also takes notice of this custom among the Eastern women, Letters, vol. ii. p. 32. This ore used at Aleppo, is the stibium of the ancients, but very different from antimony, is brought from Persia, and prepared by roasting it in a quince, an apple or a truffle, then adding a few drops of oil of almonds, it is ground to a subtle powder on a marble. The quantity of kohol consumed in the East is incredibly great. It has been said by one of their poets, in allusion to the probe used for applying the

powder, and the mountains where the mineral is found, ‘that the mountains have been worn away by a bodkin.’ This probe or bodkin, called meel, is made of ivory, silver, or wood; it is dipped in water, and when a little of the powder has been sprinkled on it, it is applied horizontally to the eye, and the eye-lids being shut upon it, the probe is drawn between them, leaving the inside tinged, and a black rim all round the edge. The Roman satirist alludes to this custom, as well as to blackening the eye-brows;

‘Illa supercilium madida fuligine tactum
Oblique producit acu, pinguitque trementes
Attollens oculos.’

Juvenal, Sat. ii. v. 67. and Casaubon's note.

Kohol is used also by men for strengthening the sight, and preventing various disorders of the eye. It is applied also to the eyes of children, as soon as they are born, and renewed at intervals of a few days through the several periods of their adolescence. The use of the kohol is of very ancient date. Passages relative to it, in sacred history, may be seen in Shaw, Travels, p. 229. Harmer, Observations. vol. ii. p. 405. and Lowth's Notes on Isaiah, c. iii. v. 16. Harmer conceives that the redness of the eyes, as it is in our version, which the dying patriarch mentions in blessing Judah, Gen. xl ix. 12, is to be explained by this usage. Dr. Russel observes, on a passage in Xenophon, referred to by Shaw, that blackening the eyes, though a custom among the Medes, was not at that time in use among the Persians; for Cyrus, among other things, seems to have been surprised at the painted eyes of his grand-father Astyages. Cyropæd. lib. i. p. 8. See Russell's Aleppo, vol. i. p. 111, p. 367. ed. 1794. Perhaps from this impalpable powder the name was transferred to other subtle powders, and afterwards to spirits of wine.

A L C O R A N.

ALCORAN, or AL-KORAN, from the Arabic particle al, and coran or koran, derived from the verb caroa or karoa, to read; signifying the reading; or rather, that which ought to be read: amongst the Mahomedans, the name of the book which contains the revelations and doctrines of their pretended prophet, Mahomet. By this name they entitle not only the entire book or volume of the Koran, but also any particular chapter or section of it; just as the Jews call either the whole scripture, or any part of it, by the name of Karah, or Mikra, words of the same origin and import. Besides this peculiar name, the Koran is also honoured with several appellations common to other books of scripture; as, al Farkan, from the verb foraka, to divide, or distinguish; not, as the Mahomedan doctors say, because these books are divided into chapters or sections, or distinguish between good and evil; but in the same notion as the Jews use the word perek, or pirkha, from the same root, to denote a section or portion of scripture. It is also called al Moshaf, the volume, and al Kitha, the book, by way of eminence, which answers to the Biblia of the Greeks; and al Dhikr, the

admonition, which name is also given to the Pentateuch and Gōspel.

The Alcoran is divided into 114 larger portions of very unequal length, which we call chapters, but the Arabians sowar, in the singular sura; a word rarely used on any other occasion, and properly signifying a row, or a regular series; as a course of bricks in building, or a rank of soldiers in an army, and is the same in use and import with the sura, or tora, of the Jews; who also called the fifty-three sections of the Pentateuch, Sedarim, a word of the same signification. These chapters are not in the manuscript copies distinguished by their numerical order, but by particular titles, which are taken sometimes from a peculiar subject treated of, or person mentioned therein; usually from the first word of note, exactly in the same manner as the Jews have named their Sedarim; though the word from which some chapters are denominated be very distant, towards the middle, or perhaps the end of the chapter, which seems ridiculous. But the occasion of this appears to have been, that the verse or passage wherein such word occurs, was, in point of time, re-

vealed and committed to writing before the other verses of the same chapter which precede it in order; and the title being given to the chapter before it was completed, or the passages reduced to their present order, the verse from whence such title was taken did not always happen to begin the chapter. Some chapters have two or more titles, occasioned by the difference of the copies. Some of them being pretended to have been revealed at Mecca, and others at Medina, the noting this difference makes a part of the title. Every chapter is divided into smaller portions, of very unequal length also, which we customarily call verse: but the Arabic word is ayat, the same with the Hebrew ottoth, and signifies signs or wonders; such as the secrets of God, his attributes, works, judgments, and ordinances, delivered in those verses; many of which have their particular titles also imposed in the same manner as those of the chapters. Besides these unequal divisions, the Mahomedans have also divided their Koran into sixty equal portions, which they call Ahzab, in the singular, Hizb, each subdivided into four equal parts; which is likewise an imitation of the Jews, who have an ancient division of their Mishna into sixty portions called Massicotioth. But the Koran is more usually divided into thirty sections only, named Ajza, from the singular, Jo., each of twice the length of the former, and in like manner subdivided into four parts. These divisions are for the use of the readers of the Koran in the royal temples, or in the adjoining chapels where the emperors and great men are interred; of whom there are thirty belonging to every chapel, and each reads his section every day; so that the whole Koran is read over once a day. Next after the title, at the name of every chapter, except only the ninth, is prefixed the following solemn form, by the Mahomedans, called the Bismallah, 'in the name of the most merciful God;' which form they constantly place at the beginning of all their books and writings in general, as a peculiar mark or distinguishing characteristic of their religion, it being counted a sort of impiety to omit it. The Jews, and eastern Christians, for the same purpose, make use of similar forms. But Mahomet probably took this form from the Persian Magi, who began their books in these words, 'Benam yezdam bakshaishgher dadar;' that is, In the name of the most merciful just God. There are twenty-nine chapters of the Koran, which have this peculiarity, that they begin with certain letters of the alphabet, some with a single one, others with more. These letters the Mahomedans believe to be the peculiar mark of the Koran, and to conceal several profound mysteries; the certain understanding of which, the more intelligent confess, has not been communicated to any mortal, their prophet only excepted: notwithstanding which, some take the liberty of guessing at their meaning, by that species of cabala, called by the Jews Notarikon. There are also abrogated passages classed under three divisions; the first, where both the letter and the sense are abrogated; the second, where this is the case with the letter only; the third, where the sense, and not the letter is abrogated.

The Koran is universally allowed to be written with the utmost elegance and purity of language, in the dialect of the tribe of Koreish, the most noble and polite of all the Arabians, but with some mixture, though very rarely, of other dialects.—It is confessedly the standard of the Arabic tongue, and, as the more orthodox believe, and are taught by the book itself, imitable by any human pen, (though some sectaries have been of another opinion,) and therefore insisted on as a permanent miracle, greater than that of raising the dead, and alone sufficient to convince the world of its divine original. And to this miracle did Mahomet himself chiefly appeal for the confirmation of his mission, publicly challenging the most eloquent men in all Arabia, which was at that time stocked with thousands whose sole study and ambition it was to excel in elegance of style and composition, to produce even a single chapter that might be compared with it. As the composition and arrangement of words, however, admit of infinite varieties, it can never be absolutely said, that any one is the best possible. In fact, Hamzah Benahmed wrote a book against the Alcoran, with at least equal elegance; and Moselema another, which even surpassed it, and occasioned a defection of a great part of the Mussulmans. To this pomp and harmony of expression, some ascribe all the force and effect of the Alcoran, which they consider as a sort of music, equally fitted with other species of that art to ravish and amaze. In this Mahomet succeeded so well, and so strangely captivated the minds of his audience, that several of his opponents thought it the effect of witchcraft and enchantment, as he himself complains. Others have attributed the effect of the Alcoran to the frequent mention of rewards and punishments; heaven and hell occurring almost in every page. Some suppose, that the sensual pleasures of paradise, so frequently set before the imaginations of the readers of the Alcoran, were what chiefly bewitched them.

The general design of the Koran was to unite the professors of the three different religions, then followed in the populous country of Arabia, (who, for the most part, wandered without guides, the far greater number being idolaters, and the rest Jews and Christians, mostly of erroneous opinions,) in the knowledge and worship of one God; under the sanction of certain laws and ceremonies, partly of ancient, and partly of novel institution, enforced by the consideration of rewards and punishments both temporal and eternal; and to bring them all to the obedience of Mahomet, as the prophet and ambassador of God; who, after the repeated admonitions, promises, and threats of former ages, was sent at last to establish and propagate God's religion on earth; and to be acknowledged chief pontiff in spiritual matters, as well as supreme prince in temporal. The great doctrine then of the Koran is the unity of God, to restore which, Mahomet pretended, was the chief end of his mission; it being laid down by him as a fundamental truth, That there never was, nor ever can be, more than one true orthodox religion: That, though the particular laws or ceremonies are only temporary and subject to alteration, according to the divine direction, yet the substance of it being eternal

truth, is not liable to change, but continues immutably the same: And that, whenever this religion became neglected, or corrupted in essentials, God had the goodness to re-inform and re-admonish mankind thereof, by several prophets, of whom Moses and Jesus were the most distinguished, till the appearance of Mahomet, who is their seal, and no other to be expected after him. The more effectually to engage people to hearken to him, great part of the Koran is employed in relating examples of dreadful punishments formerly inflicted by God on those who rejected and abused his messengers; several of which stories, or some circumstances of them, are taken from the Old and New Testaments, but many more from the apocryphal books and traditions of the Jews and Christians of those ages, set up in the Koran as truths, in opposition to the Scriptures, which the Jews and Christians are charged with having altered; and indeed, few or none of the relations or circumstances in the Koran were invented by Mahomet, as is generally supposed, it being easy to trace the greatest part of them much higher, as the rest might be, were more of those books extant, and were it worth while to make the enquiry.—The rest of the Alcoran is taken up in prescribing necessary laws and directions, frequent admonitions to moral and divine virtues, the worship and reverence of the Supreme Being, and resignation to his will. One of their most learned commentators distinguishes the contents of the Alcoran into allegorical and literal; under the former are comprehended all the obscure, parabolical, and enigmatical passages, with such laws as are repealed, or abrogated; the latter such as are clear and in full force. The most excellent moral in the whole Alcoran, interpreters say, is that in the chapter *Al Arayf*, viz. ‘Shew mercy, do good to all, and dispute not with the ignorant;’ or, as Mr. Sale renders it, ‘Use indulgence, command that which is just, and withdraw far from the ignorant.’ Mahomet, according to the authors of the *Keschaf*, having begged of the angel Gabriel a more ample explication of this passage, received it in the following terms: ‘Seek him who turns thee out, give to him who takes from thee, pardon him who injures thee; for God will have you plant in your souls the roots of his chief perfections.’ It is easy to see that this commentary is borrowed from the gospel. In reality, the necessity of forgiving enemies, though frequently inculcated in the Alcoran, is of a later date among the Mahomedans, than among the Christians; among those later than among the heathens; and to be traced originally among the Jews. See Exodus xxxiii. 4, 5. But it matters not so much who had it first, as who observes it best. The caliph Hassan, son of Hali, being at table, a slave let fall a dish of meat reeking hot, which scalded him severely. The slave fell on his knees, rehearsing these words of the Alcoran, ‘Paradise is for those who restrain their anger.’ ‘I am not angry with thee,’ answered the caliph. ‘And for those who forgive offences against them,’ continues the slave. ‘I forgive thee thine,’ replies the caliph. ‘But above all, for those who return good for evil,’ adds the slave. ‘I set thee at liberty,’ rejoined the caliph, ‘and I give thee ten dinars.’

There are also a great number of occasional passages in the Alcoran, relating only to particular emergencies. For this advantage Mahomet had by his piecemeal method, of receiving and delivering his revelations, that whenever he happened to be perplexed with any thing, he had a certain resource in some new morsel of revelation. It was an admirable contrivance to bring down the whole Alcoran only to the lowest heaven, not to earth; since, had the whole been published at once, innumerable objections would have been made, which it would have been impossible for him to have solved; but as he received it by parcels, as God saw fit they should be published for the conversion and instruction of the people, he had a sure way to answer all emergencies, and to extricate himself with honour from any difficulty which might occur.

It is the common opinion, that Mahomet, assisted by one Sergius, a monk, composed this book; but the Mussulmans believe, as an article of their faith, that the prophet, who, they say, was an illiterate man, had no concern in inditing it; but that it was given him by God, who, to that end, made use of the ministry of the angel Gabriel: that, however, it was communicated to him by little and little, a verse at a time, and in different places, during the course of twenty-three years.—‘And hence, say they, proceed that disorder and confusion visible in the work;’ which in truth, are so great, that all their doctors have never been able to adjust them. For Mahomet, or rather his copyist, having put all the loose verses promiscuously in a book together, it was impossible ever to retrieve the order wherein they were delivered.—Those twenty-three years, which the angel employed in conveying the Alcoran to Mahomet, are of wonderful service to his followers: inasmuch as they furnish them with an answer, to such as tax them with those glaring contradictions of which the book is full, and which they piously ascribe upon God himself; alleging that in the course of so long a time, he repaled and altered several doctrines and precepts which the prophet had before received of him.—M. D’Herbelot thinks it probable, that when the heresies of the Nestorians, Eutychians, &c. had been condemned by ecumenical councils, many bishops, priests, monks, &c. being driven into the deserts of Arabia and Egypt, furnished the impostor with passages, and crude, ill-conceived doctrines, out of the Scriptures; and that it was hence that the Alcoran became so full of the wild and erroneous opinions of those heretics.—The Jews also, who were very numerous in Arabia, furnished materials for the Alcoran; nor is it without some reason, that they boast twelve of their chief doctors to have been the authors of this work.—The Alcoran, while Mahomet lived, was only kept in loose sheets; his successor, Abubeker, first collected them into a volume, and committed the keeping of it to Haphsa, the widow of Mahomet, in order to be consulted as an original; and there being a good deal of diversity between the several copies already dispersed throughout the provinces, Ottoman, successor of Abubeker, procured a great number of copies to be taken from that of Haphsa; at the same time suppressing all the others not conformable to the original.

The chief differences, in the present copies of this book, consist in the points, which were not in use in the time of Mahomet, and his immediate successors; but were added since, to ascertain the reading; after the example of the Massoretes, who added the like points to the Hebrew texts of Scripture. There are seven principal editions of the Alcoran; two at Medina, one at Mecca, one at Cusa, one at Bassora, one in Syria, and the common, or vulgate edition. The first contains 6000 verses, the others surpassing this number by 200 or 236 verses; but the number of words and letters is the same in all, viz. 77,639 words, and 323,015 letters. The following are the most beautiful manuscript copies found in Europe. One, supposed to have been used by Solyman the Great, in the Museum Kircherianum, at Rome; one in the library of Christiana of Sweden; one in the Imperial library at Vienna; one, with a commentary, by Abi Saidi Rades, obtained among the spoils at the defeat of the Turks, in 1683, by George, elector of Saxony. The first edition of the whole in Arabic, was published at Venice, in 1530, by Paganinus of Brescia, which was burnt by order of the pope. Afterwards, in 1684, it was printed at Hamburg. In 1698, the original, with a Latin version, and a partial confutation, was published at Padua, by Father Lewis Maracci, by desire of pope Innocent XI. An edition of the Arabic, with Scholia, was printed in folio, at Petersburgh, by the empress Catharine, with a studious imitation of a manuscript character, in order to meet the prejudices of her Mahomedan subjects. The first Latin version by a Christian was in 1143, when an Englishman, with the aid of Hermannus Dalmata, performed the task. In 1550, it was published by Bibiane, and, about the close of the fifteenth century, was translated into the Arragonian language by Johannes Andreas, a convert from the Mahomedan faith. Reineccius published an edition of Maracci's translation, with notes, at Leipsic, in 1721. Sale's well-known translation was published in London, in 1734; a German translation, by Boysen, at Halle, in 1773, and a French one, by Savary, at Paris, 1782. The number of commentaries on the Alcoran is so large, that the bare titles would make a huge volume. Ben Oschair has written the history of them, entitled, *Tarikh Ben Oschair*. The principal among them are, Reidhaori, Thaaebi, Zamalchchari, and Bacai. The Mahomedans have a positive theology, built on the Alcoran and tradition; as well as a scholastical one, built on reason. They have likewise their casuists, and a kind of canon law; wherein they distinguish between what is of divine, and what of positive right. They have also their beneficiaries, chaplains, almoners, and canons, who read a chapter every day out of the Alcoran, in the mosques; and have prebends annexed to their office. The hatib of the mosque is what we call the parson of the parish; and the scheics are the preachers, who take their texts out of the Alcoran.

It is the general belief among the Mahomedans, that the Koran is of divine original; nay, that it is eternal and uncreated; remaining, as some express it, in the very essence of God; that

the first transcript has been from everlasting by God's throne, written on a table of vast bigness, called the preserved table, in which are also recorded the divine decrees past and future: that a copy from this table, in one volume on paper, was by the ministry of the angel Gabriel sent down to the lowest heaven, in the month of Ramadan, on the night of power; from whence Gabriel revealed it to Mahomet by parcels, some at Mecca, and some at Medina, at different times during the space of twenty-three years, as the exigency of affairs required; giving him, however, the consolation to show him the whole, which they tell us was bound in silk, and adorned with gold and precious stones of paradise, once a year; but in the last year of his life he had the favour to see it twice. They say, that only ten chapters were delivered entire, the rest being revealed piecemeal, and written down from time to time by the prophet's amanuensis, in such a part of such and such a chapter, till they were completed, according to the directions of the angel. The first parcel that was revealed, is generally agreed to have been the first five verses of the ninety-sixth chapter.—In fine, the book of the Alcoran is held in the highest esteem and reverence among the Mussulmans. They dare not so much as touch it, without being first washed, or legally purified; to prevent which, an inscription is put on the cover or label, 'Let none touch but they who are clean.' Some Mahomedan sects, however, do not admit the Koran to be uncreated, and accuse the maintainers of this doctrine of infidelity, as asserting two eternal beings. This was particularly the case with the sect called the Motazalites, and the followers of Isa Ebn Sobeh Abu Musa, surnamed Al Mozdar. It is nevertheless read with great care and respect; being never held below the girdle. They swear by it; take omens from it on all weighty occasions; carry it with them to war; write sentences of it in their banners; adorn it with gold and precious stones; and, knowingly, suffer it not to be in the possession of any of a different religion. Some say that it is punishable even with death, in a Christian, to touch it; others, that the veneration of the Mussulmans leads them to condemn the translating it into any other language, as a profanation; but these seem to be exaggerations. The Mahomedans have taken care to have their scripture translated into the Persian, the Javan, the Malayan, and other languages; though, out of respect to the original, these versions are generally, if not always, interlined.

With regard to that most prominent feature of the Koran, and which its admirers have ever represented as its grand excellence, the inculcation of the worship of the one God, as a being of infinite perfection and glory, it might easily be shewn, that whatever accurate descriptions are given of his attributes, they were borrowed from the Christian Scriptures: nor can it be imagined that they should be primarily communicated to the pretended prophet of Arabia, amidst such a mass of contradiction and absurdity. As to other representations, such especially as relate to paradise, nothing can be more completely in contrast than the Holy Scriptures and the Mahomedan Bible. The former exhibits to the

view of mortals a scene replenished with felicity, but felicity of the purest kind, such as sanctified spirits may be expected to relish, and such as a holy God might be believed to communicate; whereas the paradise of the Koran is neither moral nor rational. It is neither more nor less than an abode of selfishness and sensuality—degrading, instead of elevating to the pure and Infinite Spirit, and mean and sordid in all its arrangements.

The Koran, thus ill sustaining its own claims to inspiration, studiously acknowledges the missions both of Moses and Christ, though it charges their disciples with corrupting the Scriptures of each dispensation. Jesus is allowed to be the true Messias, and a worker of miracles, but his crucifixion is denied, the traitor Judas, it is asserted, being changed into his likeness, and put to death in his stead. Every circumstance, indeed, connected with the histories of the Holy Scriptures, is either distorted or blended with the fictions of Rabbinical tradition, or with spurious gospels. Its doctrinal principles are borrowed frequently from the Arianism of the Arabian Christians, and the notions of the Persian magi.

The author of the ‘View of Christianity and Mahomedanism,’ observes, that by the advocates of Mahomedanism, the Koran has always been held forth as the greatest of miracles, and equally stupendous with the act of raising the dead. The miracles of Moses and Jesus, they say, were transient and temporary; but that of the Koran is permanent and perpetual; and, therefore, far surpasses all the miraculous events of preceding ages. We will not detract from the real merit of the Koran: we allow it to be generally elegant and often sublime: but at the same time we reject with disdain its arrogant pretence to any thing supernatural; all the real excellence of the work being easily referrible to natural and visible causes.—In the language of Arabia, a language extremely loved and diligently cultivated by the people to whom it was vernacular, Mahomet found advantages which were never enjoyed by any former or succeeding impostor. It requires not the eye of a philosopher to discover in every soil and country a principle of national pride: and if we look back for many ages on the history of the Arabians, we shall easily perceive that pride, among them, invariably to have consisted in the knowledge and improvement of their native language. The Arabic, which has been justly esteemed the most copious of the Eastern tongues; which had existed from the remotest antiquity; which had been embellished by numberless poets, and refined by the constant exercise of the natives; was the most successful instrument which Mahomet employed in planting his new religion among them. Admirably adapted by its unrivalled harmony, and by its endless variety to add painting to expression, and to pursue the imagination in its unbounded flight, it became in the hands of Mahomet an irresistible charm to blind the judgment, and to captivate the fancy of his followers.—Of that description of men, who first composed the adherents of Mahomet, and to whom the Koran was addressed, few, probably, were able to pass

a very accurate judgment on the propriety of the sentiments, or on the beauty of the diction: but all could judge of the military abilities of their leader; and in the midst of their admiration it is not difficult to conceive, that they would ascribe to his compositions every imaginary beauty of inspired language.—The shepherd and the soldier, though awake to the charms of those wild but beautiful compositions, in which were celebrated their favourite occupations of love or war, yet were little able to criticise any other works than those which were addressed to their imagination or their heart. To abstract reasonings on the attributes and the dispensations of the Deity, to the comparative excellencies of rival religions, to the consistency of any one religious system in all its parts, and to the force of its various proofs, they were quite inattentive. In such a situation, the appearance of a work, which possessed something like wisdom and consistency; which prescribed the rules, and illustrated the duties of life; and which contained the principles of a new and comparatively sublime theology, independently of its real and permanent merit, was likely to excite their astonishment, and to become the standard of future composition. In the first periods of the literature of every country, something of this kind has happened. The father of Grecian poetry very obviously influenced the taste and imitation of his country. The modern nations of Europe all possess some original author, who, rising from the darkness of former ages, has begun the career of composition, and tinctured with the character of his own imagination the stream which has flowed through his posterity. But the prophet of Arabia had, in this respect, advantages peculiar to himself. His compositions were not to his followers the works of man, but the genuine language of Heaven, which had sent him. They were not confined therefore to that admiration, which is so liberally bestowed on the earliest productions of genius, or to that fond attachment, with which men every where regard the original compositions of their country; but with their admiration they blended their piety. To know and to feel the beauties of the Koran, was in some respect to share in the temper of heaven; and he who was most affected with admiration in the perusal of its beauties, seemed fitly the object of that mercy which had given it to ignorant man. The Koran, therefore, became naturally and necessarily the standard of taste. With a language thus hallowed in their imaginations, they were too well satisfied, either to dispute its elegance or improve its structure. In succeeding ages, the additional sanction of antiquity, or prescription, was given to these compositions which their fathers had admired; and, while the belief of its divine original continues, that admiration, which has thus become the test and the duty of the faithful, can neither be altered nor diminished. When, therefore, we consider these peculiar advantages of the Koran, we have no reason to be surprised at the admiration in which it is held. But if, descending to a more minute investigation of it, we consider its perpetual inconsistency and absurdity, we shall indeed have cause for astonishment at that

weakness of humanity, which could ever have received such compositions as the work of the Deity.

'The first praise of all the productions of genius, (continues this author) is invention: that quality of the mind, which, by the extent and quickness of its views, is capable of the largest conceptions, and of forming new combinations of objects the most distant and unusual. But the Koran bears little impression of this transcendent character. Its materials are wholly borrowed from the Jewish and Christian Scriptures, from the Talmudical legends and apocryphal gospels then current in the east, and from the traditions and fables which abounded in Arabia. The materials collected from these several sources are here heaped together, with perpetual and needless repetitions, without any settled principle or visible connection. When a great part of the life of Mahomet had been spent in preparatory meditation on the system he was about to establish, its chapters were dealt out slowly and separately during the long period of twenty-three years. Yet thus defective in its structure, and no less exceptionable in its doctrines, was the work which Mahomet delivered to his followers as the oracles of God. The most prominent feature of the Koran, that point of excellence in which the partiality of its admirers has ever delighted to view it, is the sublime notion it generally impresses of the nature and attributes of God. If its author had really derived these just conceptions from the inspiration of that Being whom they attempt to describe, they would not have been surrounded, as they now are on every side, with error and absurdity. But it might easily be proved, that whatever it justly defines of the divine attributes, was borrowed from our holy Scripture; which even from its first promulgation, but especially from the completion of the New Testament, has extended the views, and enlightened the understandings of mankind; and thus furnished them with arms, which have too often been ineffectually turned against itself by its ungenerous enemies. In this instance particularly, the copy is far below the great original, both in the propriety of its images, and the force of its descriptions.'

As a specimen of the Alcoran, we may take the opening passages, which are solemn and imposing: 'In the name of the most merciful God! Praise be to God, the Lord of all creatures: the most merciful: the King of the day of judgment.—Thee do we worship, and of thee do we beg assistance. Direct us in the right way; in the way of those to whom thou hast been gracious; not of those against whom thou art incensed, nor of those who go astray.' This is the first chapter, and is entitled the preface, or introduction, revealed at Mecca. In Arabic it is called Al Fâtibat, and is esteemed the quintessence of the whole Koran, the Mahomedans often repeating it in their devotions, both public and private, as Christians do the Lord's prayer. One or two other specimens will serve to convey to the reader some general idea of this volume. 'Now hath God in truth verified unto his apostle the vision (or dream which Mahomet had at Medina,) wherein he said ye shall surely enter the holy

temple of Mecca, if God please, in full security; having your heads shaved and your hair cut; ye shall not fear; for God knoweth that which ye know not; and he hath appointed you, besides this, a speedy victory. It is he who hath sent his apostle with the direction, and the religion of truth; that he may exalt the same above every religion; and God is a sufficient witness hereof. Mahomet is the apostle of God, and those who are with him are fierce against the unbelievers, but compassionate towards one another. Thou mayest see them bowing down prostrate, seeking a recompence from God and his good will. Their signs are in their faces, being marks of frequent prostration. This is their description in the Pentateuch, and their description in the gospel: they are as seed which putteth forth its stalk and strengtheneth it, and swelleth in the ear and riseth upon its stem, giving delight unto the sower. Such are the Moslems described to be, that the infidels may swell with indignation at them. God hath promised unto such of them as believe, and do good works, pardon and a great reward.'—Ch. xlviii.

The following is one of the smaller sections (ch. lxxii) entire,

'Entitled the Genii; revealed at Mecca.

'In the name of the Most Merciful God,

'Say, it hath been revealed unto me, that a company of genii attentively heard me reading the Koran, and said, verily we have heard an admirable discourse, which directeth unto the right institution; wherefore we believe therein, and we will by no means associate any other with our Lord. He (may the majesty of our Lord be exalted!) hath taken no wife, nor hath he begotten any issue; yet the foolish among us have spoken that which is extremely false of God: but we verily thought that neither man nor genius would by any means have uttered a lie concerning God. And there are certain men who fly for refuge unto certain of the genii; but they increase their folly and transgression; and they also thought as ye thought, that God would not raise any one to life. And we formerly attempted to pry into what was transacting in heaven; but we found the same filled with a strong guard of angels, and with flaming darts; and we sat on some of the seats thereof, to hear the discourse of its inhabitants: but whoever listeneth now, findeth a flame laid in ambush for him, to guard the celestial confines. And we know not whether evil be hereby intended against those who are on the earth, or whether their Lord intendeth to direct them aright. There are some among us who are upright; and there are some among us who are otherwise. We are of different ways. And we verily thought that we could by no means frustrate God in the earth; neither could we escape him by flight: wherefore, when we had heard the direction contained in the Koran, we believed therein. And whoever believeth in his Lord, need not fear any diminution of his reward, nor any injustice. There are some Moslems among us; and there are others of us who swerve from righteousness. And whoso embraceth Islam, they earnestly seek true direc-

tion : but those who swerve from righteousness shall be fuel for hell. If they tread in the way of truth, we will surely water them with abundant rain, that we may prove them thereby ; but whoso turneth aside from the admonition of his Lord, him will he send into a severe torment. Verily the places of worship are set apart unto God ; wherefore invoke not any other therein together with God. When the servant of God stood up to invoke him, it wanted little but that the genii had pressed on him in crowds, to hear him rehearse the Koran. Say, verily I call upon my Lord only, and I associate no other God with him. Say, verily I am not able, of myself, to procure you either hurt or a right institution. Say, verily none can protect me against God ; neither shall I find any refuge besides him. I can do no more than publish what hath been revealed unto me from God, and his messages. And whosoever shall be disobedient unto God and his apostle, for him is the fire of hell prepared ; they shall remain therein for ever. Until they see the vengeance with which they are threatened, they will not cease their opposition ; but then shall they know who were the weaker in a protector and the fewer in number. Say, I know not whether the punishment with which ye are threatened be nigh, or whether my Lord will appoint for it a distant term. He knoweth the secrets of futurity ; and he doth not communicate his secrets unto any, except an apostle in whom he is well pleased : and he causeth a guard of angels to march before him and behind him, that he may know that they have executed the commission of their Lord : he comprehendeth whatever is with them, and counteth all things by number.'

'Our holy Scriptures, continues our author, are the only compositions that can enable the dim sight of mortality to penetrate into the invisible world, and to behold a glimpse of the divine perfections. Accordingly, when they would represent to us the happiness of heaven, they describe it, not by any thing minute and particular, but by something general and great ; something, that, without descending to any determinate object, may at once by its beauty and immensity, excite our wishes and elevate our affections. Though in the prophetical and evangelical writings, the joys that shall attend us in a future state, are often mentioned with ardent admiration, they are expressed rather by allusion than by similitude, rather by indefinite and figurative terms, than by any thing fixed and determinate. 'Eye hath not seen, nor ear heard, neither have entered into the heart of man, the things which God hath prepared for them that love him.' 1 Cor. ii. 9. What a reverence and astonishment does this passage excite in every hearer of taste and piety ! What energy, and at the same time what simplicity, in the expression ! How sublime, and at the same time how obscure, is the imagery ! Different was the conduct of Mahomet in his descriptions of heaven and paradise. Unassisted by the necessary influence of virtuous intentions and Divine inspiration, he was neither desirous, nor indeed able, to exalt the minds of men to sublime conceptions, or to rational expectations. By attempting to explain what is inconceivable,

to describe what is ineffable, and to materialize what in itself is spiritual, he absurdly and impiously aimed to sensualize the purity of the Divine essence. Thus he fabricated a system of incoherence, a religion of depravity, totally repugnant to the nature of that Being, who, as he pretended, was its object ; but therefore more likely to accord with the appetites and conceptions of a corrupt and sensual age. That we may not appear to exalt our Scriptures thus far above the Koran by an unreasonable preference, we shall produce a part of the second chapter of the latter, which is deservedly admired by the Mahomedans, who wear it engraved on their ornaments, and recite it in their prayers. 'God ! there is no God but he ; the living, the self-subsisting : neither slumber nor sleep seizeth him : to him belongeth whatsoever is in heaven, and on earth. Who is he that can intercede with him but through his good pleasure ? He knoweth that which is past, and that which is to come. His throne is extended over heaven and earth, and the preservation of both is to him no burden. He is the high, the mighty.' Sale's Koran. ii. p. 30. To this description who can refuse the praise of magnificence. Part of that magnificence, however, is to be referred to that verse of the Psalmist, whence it was borrowed, 'He that keepeth Israel, shall neither slumber nor sleep.' Psal. cxxi. 4. But if we compare it with that other passage of the inspired Psalmist, cii. 24—27, all its boasted grandeur is at once obscured, and lost in the blaze of a greater light. 'O my God, take me not away in the midst of my days ; thy years are throughout all generations. Of old hast thou laid the foundation of the earth ; and the heavens are the work of thy hands. They shall perish, but thou shalt endure ; yea all of them shall wax old, like a garment ; as a vesture shall thou change them, and they shall be changed. But thou art the same, and thy years shall have no end.' The Koran, therefore, upon a fair examination, far from supporting its arrogant claim to a supernatural work, sinks below the level of many compositions confessedly of human original ; and still lower does it fall in our estimation, when compared with that pure and perfect pattern, which we justly admire in the Scriptures of truth. It is therefore abundantly apparent, that no miracle either was externally performed for the support, or is internally involved in the composition of the Mahomedan revelation.'

ALCORAN, used figuratively, is applied to certain other books full of impieties and impostures.—In this sense we meet with the Alcoran of the Cordeliers, which has made a great noise ; wherein St. Francis is extravagantly magnified and put on a level with Jesus Christ. The Alcoran of the Cordeliers is properly an extract of a very scarce book, entitled, *The Conformity of the Life of the Seraphic Father Francis, with the Life of Christ*, published in 1510, 4to ; since, at Bologna, in folio. Erasmus Albertus, being, by the elector of Brandenburg, appointed to visit a monastery of Franciscans, found this book ; and, being struck with the extreme absurdity of it, collected a number of curiosities out of it, and published them under the title of the Al-

coran of the Franciscans, with a preface by Martin Luther.

ALCORAN, in architecture, is used among the Persians, for a kind of tower, or steeple, very high, and narrow ; surrounded without by two or three galleries, one over another : whence the

Moravites, a sort of priests, repeat prayers from the Koran thrice a day, with a very loud voice ; making the tour of the gallery all the while, that they may be the better heard around. Like the minarets of the Turks, these are the principal ornaments of the Mosques.

ALCORANISTS, among Mahomedans, those who adhere strictly to the letter or text of the Alcoran, from an opinion of its ultimate sufficiency and perfection. The Persians are generally Alcoranists. The Turks, Tartars, Arabs, &c. besides the Alcoran, admit a multitude of traditions.

ALCOVE, Spanish, *alcoba*; Danish, *alkove*; from the Arabic, *alkubba*: an arched or vaulted apartment, containing a bed of state, or seats for company : also a shady recess in gardens or pleasure grounds.

The weary'd champion lull'd in soft alcoves,
The noblest boast of thy romantic groves :
Oft, if the muse presage, shall he be seen
By Rosamonda fleeting o'er the green ;
In dreams be hail'd by heroes' mighty shades,
And hear old Chaucer warble through the glades.

Tickell.

Deep in a rich alcove the prince was laid,
And slept beneath the pompous colonnade.

Pope's Odyssey

On mossy banks, beneath the citron grove,
The youthful wand'lers found a wild alcove.
Falconer's Shipwreck.
This gloomy alcove darkling to the sight,
Where meeting trees create eternal night ;
Save when from yonder stream the sunny ray,
Reflected gives a dubious gleam of day.

Kirke White's Poems.

ALCOVE, in architecture, the recess or part of a chamber which is generally appropriated in magnificent houses to the state-bed. See the above lines of Pope. The word was adopted by the Spanish architects from the Arabic el-kauf, which bears the same meaning. But more ancient architects often made alcoves in the form of a niche, as in the ruins of Hadrian's villa, those of Trajan's villa, at Pompeii, at Trivoli, &c. The alcove of modern times is susceptible of great magnificence and elegance. It may be raised above the other part of the chamber and approached by steps, separated by columns, anta and balusters, agreeing with the architecture of the apartments, and with dwarf doors in the balustrade for entrance. The interior may be embellished with basso-relievo, panelling, pictures, and tapestry, with a magnificent state bed, or throne, to complete the arrangement. If for a bed-chamber, at the sides of the alcove should be warm and cold baths, dressing and water-closets, &c. according to the magnificence of the mansion, and the rank and opulence of the owner ; such are found in the palaces of Italy, and the mansions of the nobility in France and Spain. The alcove, of course, should correspond in every respect with the style of architecture and decoration used in the apartment.

ALCOVENDAS, a small town of Old Castile.

ALCOVES, from eleauf, Arab. a sleeping

place, or elcoba, a tent, are frequent in Spain ; and the bed is raised two or three ascents, with a rail at the foot. The word is often used for inclosed garden seats.

ALCOY, a town of Spain, in the province of Valencia, with flourishing manufactures of cloth, soap, and paper ; fruitful environs, and nearly 10,000 inhabitants. Twenty miles north of Alicante.

ALCUDIA, a decayed city of the island of Majorca, situated between Port Major and Port Minor, and containing about 1000 inhabitants. Lon. 3°. 0'. E. Lat. 30°. 50'. N.

ALCUDIA DE CARLET, a town of Valencia, Spain, with about 2000 inhabitants, a parochial church, and a convent of Franciscans. It is five leagues south of the capital of the province.

ALCUINUS, (Flaccens,) or ALRINUS, an ecclesiastic of the eighth century, who is said to have been born in Yorkshire, and who certainly was educated there, under archbishop Egbert; as we learn from his own letters, in which he frequently calls that prelate his beloved master. He survived Bede about seventy years, and speaks of him with the highest veneration. It is said, that before he left England he was abbot of Canterbury. In 790 he was sent on an embassy, by Offa, king of Mercia, to the emperor Charlemagne; who contracted so great an esteem for him, that he prevailed upon him to settle in his court, and become his preceptor in the sciences. The courtiers called him, by way of eminence, the emperor's delight. Mr. Turner, in his excellent history of the Anglo-Saxons, speaks of him at this period, as in the enjoyment of imperial affection and confidence, to a degree which literature has never experienced in any other instance. Charlemagne employed him to write several books against the heretical opinions of Felix, bishop of Urgel, in Catalonia, and to defend the orthodox faith against him in the council of Frankfort, A. D. 794 ; which he performed, it is said, not only to the satisfaction of the emperor, but to the conviction of Felix and his followers. An academy was established in the imperial palace, over which Alcuinus presided, and in which the princes and nobility were educated ; other academies were established in the chief towns of Italy and France, at his instigation, and under his inspection ; and the whole of that kingdom became indebted to Alcuinus for its polite learning. The universities of Paris, Tours, Fulden, Soissons, &c. owe to him their origin or their increase ; those of which he was not the superior and founder, being enlightened by his doctrine and example, and enriched by the substantial benefits he procured for them from Charlemagne. Camden cites a German poet who thus speaks of these philanthropic services of Alcuinus :—

' Quid non Alcuino, facunda Lutetia, debes !
 Instaurare bonas ibi qui feliciter artes,
 Barbariemque procul solus depellere, cæpit.'
 ' Let Gallia's sons, nurtur'd in ancient lore,
 To Alcuin's name a grateful tribute pay ;
 'Twas his, the light of science to restore,
 And bid Barbaric darkness flee away.'

We cannot forbear to subjoin an extract from this excellent prelate's letters to Charlemagne, exhibiting a picture of his mind and occupations, as creditable to himself as it is interesting and surprising, in so dark an age. They are dated from his beloved retreat.—'The employments of your Alcuinus in his retreat are suited to his humble sphere; but they are neither inglorious nor unprofitable. I spend my time in the halls of St. Martin, in teaching some of the noble youths under my care the intricacies of grammar, and inspiring them with a taste for the learning of the ancients; in describing to others the order and revolutions of those shining orbs, which adorn the azure vault of heaven; and in explaining to others the mysteries of divine wisdom, which are contained in the holy scriptures; suiting my instructions to the views and capacities of my scholars, that I may train up many to be ornaments to the church of God, and to the court of your imperial majesty.'

To the honour of old England he continues, 'In doing this, I find a great want of several things, particularly of those excellent books in all arts and sciences, which I enjoyed in my native country, through the expense and care of my great master Egbert. May it therefore please your majesty, animated with the most ardent love of learning, to permit me to send some of our young gentlemen into England, to procure for us those books which we want, and transplant the flowers of Britain into France, that their fragrance may no longer be confined to York, but may perfume the palaces of Tours. I need not put your majesty in mind, how earnestly we are exhorted in the holy scriptures to the pursuit of wisdom.—Learning and wisdom exalt the low, and give additional lustre to the honours of the great. 'By wisdom kings reign, and princes decree justice.' Cease not, then, O most gracious king! to press the young nobility of your court to the eager pursuit of wisdom and learning in their youth, that they may attain to an honourable old age, and a blessed immortality. For my own part, I will never cease, according to my abilities, to sow the seeds of learning in the minds of your subjects in these parts; mindful of the saying of the wisest man, 'In the morning sow thy seed, and in the evening withhold not thine hand; for thou knowest not whether shall prosper, either this or that.' To do this, hath been the most delightful employment of my whole life. In my youthful years I sowed the seeds of learning in the flourishing seminaries of my native soil of Britain; and in my old age, I am doing the same in France, praying to God, that they may spring up and flourish in both countries.' 'How few princes,' says Henry, 'enjoy the happiness of such a correspondence, or have the wisdom and virtue to encourage it!'

At length he wholly retired from court to his abbey of St. Martin's at Tours, where he maintained

a regular correspondence with the emperor; from which it would seem that both were animated with the most ardent love to learning and religion. He wrote in a style much superior in elegance to that of his contemporaries. Charlemagne often solicited Alcuin to return to court, but he excused himself; and died A. D. 804, in his retirement. His works were collected and published, by Andrew Du Chesne, in one volume folio, Paris 1617. They consist of, 1. Tracts upon Scripture doctrine, discipline, and morality. 2. Historical treatises, letters, poems, &c.

ALCYON, in ornithology, the trivial name of a species of alcedo. See ALCEDO.

ALCYONE, in entomology, a species of the *papilio nymphalis*, with dentated brown wings and yellow bands, the interior having two oscilli on both sides, and the posterior marbled below; it is found in the mountains of the southern parts of Russia.

ALCYONE, a town in Thessaly.

ALCYONE, in mythology, the daughter of Neptune, and wife of Ceyx, king of Thrace, who hearing of her husband's death at sea, cast herself into it, whereupon they were both metamorphosed into kingsfishers.

ALCYONIUM, in natural history, a peculiar kind of fossil coral of the astroites kind, found in Wales, where it is very plentiful, and has the appearance of a sort of marble.

ALCYONIUM, in the Linnaean system of zoology, a genus of zoophytes; the characters of which are, that the animal grows in the form of a plant: the stem or root being fixed, fleshy, gelatinous, spongy, or coriaceous; with a cellular epidermis, penetrated with stellated pores, and shooting out tentaculated oviparous hydra. The number of species, mentioned and characterized by Gmelin, is twenty-eight; viz. 1. *A. arboreum*, with woody stem, obtuse branches, and pores in the form of pimples, found in Norway, White, and Indian seas, sometimes of the human height. 2. *A. exos*, with stem arborescent, coriaceous, crimson-coloured, above ramous, and with stellated papillæ; called by several authors the sea-hand, and found at the bottom of the Mediterranean sea. 3. *A. epipatrum*, with stem cavated, fleshy, and reddish: the finger-shaped sea-pen of Ellis, and sea mad-apple of Rondeletius, found in the Mediterranean, about four inches long, and of the thickness of the finger. 4. *A. agaricum*, with stem filiform, and reniform; pileus kidney-shaped, purple, sea-pen of Ellis, found in the sea, washing the coast of Carolina. 5. *A. digitatum*, stemless, oblong, coriaceous, and rugose; dead-man's hand, or dead-man's toes of Ellis; the tethya of Rumphius, and fucus palma marinus of C. Bauhin, found in the European sea, encrusting testaceous fish and stones. 6. *A. schlosseri*, roundish and stupose, penetrated with ray-like stars; the alcyonium ramosum lividum, &c. of Solander and Ellis, the uva marina of Gesner, the botryllus stellatus of Gærtner, found on the coast of Cornwall, brown or ashy, and covering other bodies. 7. *A. lyncurium*, globose, fibrous, yellow and warty; the tethya sphærica of Donat, found in the Mediterranean, and at the Cape of Good Hope, about the size of an orange, and cartilaginous. 8. *A.*

bursa, sub-globose, pulposus and green; the sea-orange of Marsilli, found in the English and Mediterranean seas, about the size of a middling apple, and coriaceous. 9. A. cydonium, roundish, spongy, yellow and smooth; found in the African, Mediterranean, and Northern seas, affixed to rocks and corals, and sometimes loosened by the agitation of the waves. 10. A. ficus, obovated, pulposus and livid; the sea-fig of Ellis, and sea-lungs of Ray, the alcyonium tuberosum of J. Bauhin, found in the Mediterranean and English seas, very rarely among fossils, of an olive colour, and within granulose. 11. A. gelatinosum, polymorphous and gelatinous; the alcyonium luteum gelatinosum polymorphum of Solander and Ellis, spongia ramosa, &c. of Parkinson, fucus gelatinosus of Hudson, and fucus nodosus and spongiosus of Ray, found in the European ocean and the Icy sea, adhering to the algaæ, stones, shell-fish, &c. 12. A. manus diaboli, polymorphous, perforated with obtuse protuberances, found in Iceland. 13. A. massa, yellow, spongy, patulous, with five radiated small stars, and black centre, found in the sea of Norway. 14. A. cranium, tuberiform, white and bristly, found in the Norway sea. 15. A. rubrum, crustaceous, soft, sprinkled with reddish scattered spots, found in the Norway sea. 16. A. mammulosum, whitish, coriaceous, with convex mammillæ, and the centre hollowed and substellated, found in the American sea. 17. A. ocellatum, ferruginous, coriaceous, with rugose subcylindric cellules, and radiated ocellated apices, found adhering to rocks, with twelve rays of stars, in the island of St. Dominica. 18. A. tuberosum, yellowish and tuberous, with the apices frequently subdivided, and tubulous pores, found adhering to rocks in the island of Mauritius. 19. A. gorgonoides, cinereous, sandy-fleshy, with radiated watery cellules, found, with twelve rays of cellules, adhering to corals and rocks, in the island of Curassoa. 20. A. asbestos, with a roundish stem, and oblong pores scattered over every part of it, found in the sea washing the American coast, very porous, whitish, and within rose-coloured. 21. A. album, white, very ramous, attenuated and subdivided, with tubulous terminal pores, found in the Indian sea. 22. A. papillosum, crustaceous, with large papillæ thickly set, and convex, the boletus marinus of Marsigli. 23. A. conglomeratum, gelatinous, convex, with conglomered fingers, and terminal mouths without teeth, found in the Cornish seas. 24. A. ascidioides, crustaceous, coriaceous, with dispersed papillæ, and two subdentated mouths, found in the Cornish seas. 25. A. synoicum, with many cylindric fleshy stems, and an orifice stellated at the apex, found on the northern shore of Spitzbergen. 26. A. vermiculare, green, ramous, with cylindric, obtuse, pyramidal branches, found on the rocks of the island of Nisita, opposite to Neapolis. 27. A. stellatum, with two stellated terminal mouths. 28. A. corniculatum, with four stellated mouths, encompassing a papilla, and four small erect terminal horns, found in the sea of Holland. From experiments made by Mr. Hatchett, on a few species of alcyonium, viz. asbestos, sicus, and arboreum, he was led to

conclude that they were all composed of a soft, flexible, membranaceous substance, slightly hardened by carbonate, mixed with a small portion of phosphate of lime. *Phil. Trans.* for 1800. P. ii. p. 364.

ALCYONIUM MARE, in ancient geography, a name given to that part of the gulph of Corinth, which stretched itself between the western coast of Boetia, the northern coast of Megaris, and a small part of Corinth, as far as the promontory of Olmia.

ALCYONIUM STAGNUM, in ancient geography, a lake in the territory of Corinth, whose depth was unfathomable, and in vain attempted to be discovered by Nero. Through this lake Bacchus is said to have descended to hell, to bring back Semele; and near it was a temple to the honour of Amphiarus, a sorcerer.

ALCYONIUS, (Peter,) a learned Italian printer, who flourished in the sixteenth century. He was well versed in Greek and Latin, and wrote some pieces which met with great approbation. He was corrector of the press a considerable time for Aldus Manutius, and is entitled to a share in the praises given to the editions of that learned printer. Paulus Manutius charges Alcyonius with the plagiarism of several fragments of a treatise of Cicero de Gloria; and that afterwards, in order to save himself from being detected, he had burnt the manuscript of Cicero, the only one extant. Be that as it may, Alcyonius was certainly capable of writing well: for the two orations he made after the taking of Rome, wherein he represented very strongly the injustice of Charles V. and the barbarity of his soldiers, were excellent pieces.

ALD, from *Eald*, Sax. or *alt*, Teut. prefixed to the names of places, signifies antiquity, as Aldborough, Aldgate, &c.

ALDABARAM, in osteology, a name given by some writers to the sesamoide bones in the great toe.

ALDAN, a river of Siberia, which, rising on the confines of China, in long. 125°. E. lat. 55°. 50'. N.; and taking a north-east course to lat. 63°. N. changes its direction to west northwest, and joins the Lena in long. 128°. 20'. E. lat. 63°. 25'. N. On the banks of this river, in the province of Yakutsk, the finest sables are obtained. When the frost breaks up, about the month of May, an inundation takes place, and the stream drifts down vast masses of ice with extraordinary impetuosity.

ALDARU, in botany, a name given by Avicenna, Serapion, and other authors, to the Lentisk tree.

AL'DAY. All day.

Withinne fyf-zer after pis kyng so prout bi com,
For pe grete tresour namelicke pat he *alday* nom.
Dat he nas not ene y paid to habbe pis kyndom.

R. of Gloucester, p. 93.

ALDBOROUGH, or **ALDEBURGH**, a sea-port, borough, and market-town of Suffolk, in the hundred of Plomsgate, ninety-four miles from London, and three miles north of Orford. Being a commodious harbour, it is chiefly inhabited by seamen and fishermen; and, although meanly built, is clean, and pleasantly situated in the valley of Slaughton. The Ald, from which this

town derives its name, runs on the south, and forms an excellent quay. The harbour is well defended by cannon, and the regular declivity of the shore affords every convenience for bathing. From the healthiness and convenience of the situation, connected with the patronage of several families of distinction, this place has of late become one of considerable resort. The encroachments of the sea having swept away one of the principal streets, Aldborough was until lately, fast falling to decay, but is now considerably improved. The church on the west of the town is a neat ancient edifice, although much intermixed with modern work. The manor of this name was originally the property of the monastery of Snape, and was afterwards granted to Cardinal Woolsey. It is governed by two bailiffs, ten burgesses, and twenty-four petty officers, and sends two members to parliament. Sprats are caught here in great quantities, and pickled for the Dutch market; as are also soles, lobsters, &c. The church is a rectory. Market-days, Wednesday and Saturday.

ALDBOROUGH, a town in the West Riding of Yorkshire, seated on the river Ouse, fifteen miles north-west of York, and 207 north by west of London. It sends two members to parliament. It was anciently a Roman city, called Isurium Brigantum; and several coins and monuments of the Saxons and Romans have been discovered there. Few places have afforded such numerous relics of the Roman dominion in Britain. Here have been discovered the fragments of aqueducts cut in great stones, and covered with tiles; a vault, which it is thought led to the river Ouse, near whose banks the present town is seated, and supposed to have been a dormitory; vast quantities of Roman coins, mostly of brass, from the reign of Augustus to Constantine; together with several signets, urns, and other utensils of red earth, wrought with a variety of figures, knots, and flowers. Some beautiful Mosaic pavement, consisting of small stones, of about a quarter of an inch square, with a border nearly four times that size, were discovered in 1770; and in the year 1808, a great number of urns, containing calcined bones, with a lachrymatory, a fibula vestaria, and eighteen human skeletons. These remains, which, there is little doubt, had been in the ground upwards of 1400 years, were all in a high degree of preservation; and a thin stratum of black earth, which surrounded them, affords a strong presumption that the bodies of those whose ashes were contained in the urns, had been burned on the place where they were deposited. On the south side of the town are the reliques of a Roman encampment, containing about two acres of ground. The Roman Isurium was, in all probability, built about the year 80; after Julius Agricola had completed the reduction of the Brigantes, one of the most powerful of all the British tribes, and possessing the entire districts, now forming the counties of York, Lancaster, Westmoreland, Cumberland, and Durham. Before the foundation of Eboracum, now the city of York, it appears to have been the principal city of the district. Some have supposed that it was burnt by the Danes; others, that it was more gradually destroyed,

and afterwards rebuilt by the Saxons, who gave it the name of Aldburgh, or the Old Town.—The market is on Wednesday.

ALDEBAC, in the *materia medica* of the ancient Arabian physicians, the name by which they have called bird-lime, which they place among the vegetable poisons.

ALDEBARAN, or the bull's eye, in astronomy, a star of the first magnitude in the southern eye of the constellation Taurus. Ptolemy calls it ὁ λαυτρὸς τῶν νεφῶν, i. e. the bright star of the Hyades. The right ascension for 1812 was 66°. 17'. 4": Declination, 16°. 7'. 31" N.: Annual variation in right ascension 51" 31": in declination 8" 16". *Ptolem. Almagest.* l. 7, c. 5, &c.

ALDENHOVEN, a bailiwick and town of the grand duchy of the Lower Rhine, in the ancient duchy of Juliers, with 1050 inhabitants. It is three miles west south-west of Juliers. Long. 7°. 12'. E. lat. 50°. 53' N.

AL'DER, or } Ailler, or allder, alle, all.

ALLER. } The ancient genitive case plural of all. It was used much in composition, in connection with adjectives in the superlative degree; as aller best, best of all; aller worst, worst of all; alder lieve, most beloved, most dear.

Grete townes in Engelond he amende y nowe,
And London aller most for per to hys herte drowe.

R. of Gloucester, p. 44.

Sex and twenty baners of Ingland alder best,
Of armes pat knewe pe maners, to werre were alle
prest.

R. Brunne, v. ii. p. 271.

Wel coude he rede a lesson or a storie,
But alderbest he sang an offertorie.

Chaucer. The Prologue, v. i. p. 29.

QUEEN. Great king of England, and my gracious
lord,

The mutuall conference that my minde hath had,
By day, by night; waking, and in my dreames,
In courtly company, or at my beads,
With you mine alder liefest soueraigne,
Makes me the bolder to salute my king.

Shakespeare's 2d. part of King Henry IV. act i.

ALDER, in botany, the betula alnus of Linnæus, a well-known tree which thrives in moist places. It is the Greek κλῆθρα, in Lat. alnus, German eller, Danish ell, and Swedish all, ahl, &c. The principal sorts of alder are, the round-leaved, or common alder, the long-leaved, and the dwarf. The wood is valuable for fences, piles, pumps, and all other works which remain under water; it is also much used by turners. The bark is employed in tanning. The black alder is the rhamnus frangula of Linnæus.

ALDERAIMIN in astronomy, a star of the third magnitude, on the right shoulder of the constellation Cepheus, marked α by Bayer.

ALDERHOLM, a pleasant island of Sweden, formed by three arms of the river Gefle. It has a wharf, and a repository for planks and deals, in which a considerable traffic is carried on. It is eighty miles north of Stockholm. N. lat. 6°. 40'.

ALD'ERMAN, n. A. S. Ealðorman, from ALD'ERMANITY, } Elb, El'don, old, older,
ALD'ERMANLIKE, } and man. Corresponding
ALD'ERMANLY, } in origin and signification
ALD'ERMANSHIP. } with the word senator, in

Latin; and a title of high distinction in Anglo-Saxon times. It is now well known as the official title of a superior member of a municipal corporation, chosen for his supposed age and experience.

The which Symðe be haued hym so well after, that he was admytted for an *alderman*; but in short processse after, he demeanyed hym so ille, and so cōtraryouslyle vnto the weale and good ordre of the citie, that he was dyscharged of his *aldermanshysp*, and dyscharged from all rule and courceyll of the citie.

Fabian, p. 331.

By the lawes of king Ina, 100 yeares before Alfred, as they are extant in the Saxon tongue, and by the lawes of Rennethus, king of Scots, there is mention made of shrynes and of the shryeman or *alderman*, whom we nowe call shireeue or *sheriffe*.

Tell him, ‘ Myself, the mayor, and *alderman*, Are come to have some conf’rence with his grace.’

Shakespeare.

Though my own *aldermen* conferr’d my bays,
To me committing their eternal praise ;
Their full-fed heroes, their pacifick may’rs,
Their annual trophies, and their monthly wars.

Pope’s Dunciad.

These, and many more, suffered death, in envy to their virtues and superior genius; which emboldened them, in exigencies wanting an *aldermanly* discretion, to attempt service out of the common forms.

Swift’s Miscellanies.

ALDERMAN, among our Saxon ancestors, was a degree of nobility answering to earl or count at present. Alderman, in process of time was also used for a justice of the peace, or judge of various degrees of authority. Thus we meet with the titles of Aldermannus totius Angliae; Aldermannus regis, comitatis, civitatis, burgi, castelli, hundredi sive wapensachi, et novem decimorum. According to Spelman, the Aldermannus totius Angliae seems to have been the same officer who was afterwards styled capitalis justiciarius Angliae, or chief justice of England; the aldermannus regis seems to have been an occasional magistrate, answering to our justice of assize; and the aldermannus comitatis, a magistrate who held a middle rank, between what was afterwards called the earl and the sheriff.—He sat at the trial of causes with the bishop; the latter proceeding according to the ecclesiastical law, and the former declaring and expounding the common law of the land. ‘ The alderman of the county,’ says Spelman of the ancient government of England, ‘ whom confusedly they call an earl, was in parallel equal with the bishop, and therefore both their estimations valued alike in the laws of Ethelstane at eight thousand thrymises, (worth about three shillings each.) He was a man learned in the laws, and had the government of the wholsshire, and cognizance over all the inferior courts and persons, both in civil matters and criminal; for which purpose he held his ordinary court by the shreve once every month, and there resorted as suitors, and bound by duty, all the lords of manors, and principal men of the county, with the rest of the freeholders, who were not only assistants, but judges with him of all matters there depending, whether entered there originally, or coming thither by appeal or provocation from the inferior courts.

‘ The Ealdorman,’ says Mr. Turner, was the highest officer in the kingdom. In rank, he was inferior to an etheling; for when an ethelings were-geld was fifteen thousand thrymises, an ealdorman’s was but eight thousand. He was the chief of a shire, and he lost this dignity if he connived at the escape of a robber, unless the king pardoned him. He was one of the witans, who attended the witen-a-gemot. He presided with the bishop at the scire-gemot, which he was ordered to attend, and the fole-gemot. He ranked with a bishop, but was superior to the thane. He had great civil powers in administering justice, and also enjoyed high military authority; he is mentioned as leading the shire to battle against the enemy. To draw weapons before him, incurred a penalty of one hundred shillings; and to fight before him in a gemot, incurred a fine to him of one hundred and twenty shillings, besides other punishments. The ealdorman is a title which occurs perpetually in the Saxon Chronicle.’

ALDERMAN, in modern British policy, is a magistrate subordinate to the lord mayor of a city or town corporate. The number of these magistrates is not limited, but is greater or less according to the magnitude of the place. In London they are twenty-six; each having one of the wards of the city committed to his care, except the twenty-sixth, erected in 1550, according to Maitland, which serves only to dignify the senior Alderman, as *father of the city*. This office is for life. When one dies, or resigns, a wardmote is called, who elect another and return him to the court of aldermen, who are obliged to admit him to supply the vacancy. All the aldermen are justices of the peace, by a charter of 15 Geo. II. They are exempted from serving in inferior offices; nor can they be put upon assizes, or serve on juries, so long as they continue in office. They may be called the peers of the city, which much resembles in its government the three estates of the kingdom. In the wardmote the alderman presides over the election of the common councilmen; and from the court of aldermen, of which the lord mayor is the official chairman, the latter officer is annually chosen.—The livery nominate, in common-hall, two aldermen to this dignity, one of whom, generally the senior, is finally elected by the court of aldermen. Those aldermen who have passed the civic chair are justices of the quorum; and the lord mayor, recorder, common serjeant, and aldermen, are judges of oyer and terminer for the city of London and county of Middlesex. The aldermen attend, or should attend, daily at the public offices, to dispose of all charges and breaches of the public peace within the city.

ALDERNEY, an island on the coast of Normandy, about eight miles in circumference, and though much nearer the French than the British coast, being within seven miles of Cape La Hogue, it is subject to the crown of Great Britain. With Guernsey, Jersey, and Sark, it forms the only part of the possessions of William the Conqueror that now remain in our possession. Alderney is about thirty miles from the nearest part of the English coast, and about eighteen from Guernsey. The Race of Alderney is a

name given to the strait running between the coast of France and this island. The town of this name, about two miles from the harbour, is but poorly built; though it has a handsome church, and contains about 1000 inhabitants. In stormy weather the whole coast is dangerous, more particularly from a ridge of rocks, called the Caskets, which, from the numerous eddies, have often proved fatal to mariners. The air is salubrious, and the soil fertile, and in the highest state of cultivation; but the custom of parting their lands into small parts by gavel-kind, keeps the people in a state of poverty. They send a considerable quantity of corn to England, but their trade is small, and they receive their goods from Guernsey. In 1119, Henry, duke of Normandy, son of king Henry I., with many of the nobility, were overtaken by a dreadful storm, and lost, near this island; and off the same rocks, in 1744, the Victory of 116 guns, admiral Sir John Balchen, with 1100 marines and sailors, foundered, and all on board perished.

ALDHAFERA, in the Arabian astronomy, denotes a fixed star of the third magnitude, in the Lion's mane, marked γ.

ALDHELM. (St.) See **ADELME**.

ALDHUN, **ALFHUNUS**, or **ALDWINUS**, was presented to the see of Lindisfarne, or Holy Island, in the year 990, the twelfth of the reign of king Ethelred. He was admonished, in a dream, as the legends of the times say, to quit the island with his brethren, and take with him the body of saint Cuthbert, which had been buried there 113 years: he obeyed, it is added, and founded the city and bishopric of Durham. Alfred and Edward, the sons of king Ethelred, were educated by this bishop, and were conducted by him, together with queen Emma, to her brother Richard, after the defeat of their father by Swaine, king of Denmark, in 1017. He died in 1719.

ALDII, in antiquity, servants who attended their masters in expeditions to the wars. These were otherwise called aldiones, aldionii, and aldonarii.

ALDRED, abbot of Tavistock, was made bishop of Worcester in 1046. He was so much in favour with king Edward the Confessor, that he induced that monarch to be reconciled with the worst of his enemies, particularly with Swaine, son of earl Godwin, who had revolted against him, and came with an army to invade the kingdom. Aldred also restored the union between king Edward and Griffin, king of Wales. He afterwards went to Rome, and in 1054, was sent ambassador to the emperor Henry II. He staid a whole year in Germany, and was very honourably entertained by Herman, archbishop of Cologne, from whom he adopted much of the ecclesiastical discipline, which, on his return, he established in his own diocese. In 1058, he went to Jerusalem, which no English prelate had ever done before him. Two years after he returned to England; and Kinsius, archbishop of York, dying in 1060, he was elected to that see, which he thought fit to hold with his bishopric of Worcester, as some of his predecessors had done. Aldred went soon after to Rome, to receive the pallium from the pope, attended by the

earl of Northumberland, and two other bishops, who were well received; but Aldred, it is said, being found ignorant, and guilty of simony, the pope refused to confirm his new appointment. On his way home, he and his fellow-travellers being attacked by robbers, they were compelled to return to Rome; and the pope, either out of compassion, or from the threatenings of the earl of Northumberland, gave Aldred the pallium; but obliged him to resign his bishopric of Worcester. However, as the archbishopric of York had been almost ruined by the many invasions of foreigners, king Edward gave the new archbishop leave to keep twelve villages, which belonged to the disputed see. Edward dying in 1066, Aldred, according to the Saxon Chronicle, crowned Harold his successor. He is also said to have crowned William the Conqueror, after he had made him swear to protect the holy churches of God and their leaders; to establish and observe righteous laws; and that he would entirely prohibit and suppress all rapine and unjust judgments. Some writers, however, dispute the fact of his having crowned the Norman monarch. It was certainly the right of the see of Canterbury. With William, Aldred soon became a favourite; and, though imperious to every body else, he submitted implicitly to this prelate; of which Brompton gives a remarkable instance. It happened, when Aldred was at York, that the deputy-governor, or lord-lieutenant, going out of the city with his attendants, met the archbishop's servants, who came to town with several carts and horses loaded with provisions. The governor asked them to whom they belonged; and they having answered they were Aldred's servants, he ordered that all the provisions should be carried to the king's storehouse. On this the archbishop sent some of his clergy to the governor, commanding him to deliver the property back, and to make satisfaction to St. Peter, and to him his vicar, for the injury he had done them. But the governor returned an answer as haughty as the message. Aldred thereupon went to London, to make his complaint to the king; and, meeting him in the church of St. Peter, at Westminster, addressed him thus: 'Hearken, O William! when thou wert a foreigner, and God, to punish the sins of this nation, permitted thee to become master of it, (after having shed a great deal of blood,) I consecrated thee, and put the crown upon thy head with blessings; but now because thou hast deserved it, I pronounce a curse on thee, instead of a blessing; since thou art become the persecutor of God's church, and of his ministers, and hast broken the promises and oaths which thou madest to me before St. Peter's altar.' Terrified at this discourse, the king fell upon his knees, it is said, and humbly begged the prelate to tell him, by what crime he had deserved so severe a sentence. While the noblemen present, enraged against the archbishop, cried out, that he deserved death, or at least banishment, for having offered such an insult to his sovereign; and pressed him with threatenings, to raise the king from the ground. But the prelate, unmoved, answered calmly, 'Good men, let him lie there; he is not at Aldred's, but at St. Peter's feet; and must feel

St. Peter's power, since he has dared to injure his vice-gerent.' He now vouchsafed to take the king by the hand, and to tell him the ground of his complaint. The king, in reply, pleaded ignorance of the whole matter; but it was not without much entreaty, aided by promises and presents, that the archiepiscopal wrath was appeased. The Danes having invaded the north of England, in the year 1068, under the conduct of Harold and Canute, the sons of Swane; Aldred is said to have died of the afflictions it caused him, on the 11th of September, in that year.

ALDRICH, (Dr. Henry,) an eminent English divine, born at London in 1647, was educated at Westminster school, under the famous Dr. Busby, and admitted of Christ-church college, Oxford. He had a great share in the controversy with the papists, in the reign of James II.; and bishop Burnet ranks him among those who had examined all the points in dispute, with a solidity of judgment, clearness of argument, and depth of learning, far beyond any who had preceded him. He rendered himself so conspicuous, that at the revolution, when Massey, the popish dean of Christ-church fled, his deancy was conferred on him. In this station he behaved in an exemplary manner, and that fabric owes to him much of its beauty. He published a System of Logic, with some other pieces; and the revising Clarendon's History of the Rebellion is said to have been entrusted to him and bishop Spratt. Dr. Aldrich was also rector of Wem in Shropshire, and prolocutor of the convocation in 1702. He died at Christ-church, on the 14th of December 1710. Dr. Aldrich had considerable taste as a musician, and composed many services, and about twenty anthems for the church; he also produced some compositions of a lighter kind. Two catches of his are still esteemed; viz. the bonny Christ-church bells, and a smoking catch, to be sung by four. His own love of smoking it seems was excessive. He is of some note as a Latin poet. In the Musæ Anglicanae, we find two elegant copies of his verses, one on the accession of king William III. and the other on the death of the duke of Gloucester. Sir John Hawkins has preserved a humorous translation by him of the well-known English ballad, a soldier and a sailor, &c.; and an epigram, entitled *Cause Bibendi*.

'Si bene quid memini, cause sunt quinque bibendi;
Hospitis adventus, presens sitis, atque futura,
Aut vini bonitas, aut qualibet altera causa.'

'If on thy theme I rightly think,
There are five reasons why men drink:
Good wine, a friend, because I'm dry,
Or lost I shall be by and bye;
Or any other reason why.'

ALDROVANDA, in botany, a genus of the pentandria order, belonging to the pentagynia class of plants; of which there is but one species: CAL. divided into five parts; the petals five; and the capsule having five valves, with ten seeds. It is a native of Italy, and the Indies; and has no English name.

ALDROVANDUS, (Ulysses,) professor of philosophy and physic at Bologna, the place of his nativity. He was a most curious enquirer into natural history, and travelled into the most

VOL. I.

distant countries on purpose to inform himself of their productions. Minerals, metals, plants, and animals, were alike the objects of his indefatigable researches; but he applied himself chiefly to birds, and was at great expense to have figures of them drawn from the life. Aubert le Mire says, that he gave a painter a yearly salary of 200 crowns, for thirty years and upwards; and employed, at his own expense, Lorenzo Bennini and Cornelius Swintus, as well as the famous engraver Christopher Coriolanus. These expenses ruined his fortune, and at length reduced him to the utmost necessity; so that he died blind, it is said, in an hospital at Bologna, at a great age, in 1605. Bayle observes, that antiquity does not furnish us with an instance of a design so extensive and laborious as that of Aldrovandus, with regard to natural history: that Pliny has treated of more kinds of subjects, but only touches lightly on any thing; whereas Aldrovandus has collected all he could meet with. The compilation, upon his plan, consists of seventeen volumes in folio, several of which were printed after his death. He himself published his History of Birds, in three folio volumes, in 1599; and seven books of insects, which make another volume of the same size.

ALDRUDE, countess of Bertinoro, in Romagna, in the twelfth century. She was celebrated for her magnanimity. In conjunction with William degli Adelardi of Ferrara, she compelled the Venetians and Imperialists to raise the siege of Ancona. The citizens made a brave resistance, but being driven to extreme exigency for want of provisions, they applied to William degli Adelardi and the countess of Bertinoro, who assembled troops, and marched to their relief. Aldrude, by her presence and exhortations, inspired the troops with courage; and on their arrival, the besiegers fled in confusion. On her return she encountered several parties of the enemy, and came off victorious in every action. William, having disbanded his troops, went to Constantinople, where he was received by the emperor with great honour.

ALDSTON-MOOR, a market town and parish of Cumberland, in the ward of Leath, 302 miles from London, and eleven from Hexham. The town is beautifully situated on the side of the hill, at the bottom of which runs the river Tyne, over which is a fine stone bridge. The neighbourhood abounds with lead mines, and is one of the most romantic parts of the border towards Northumberland. The church is a curacy. Market on Saturday.

ALDUABIS, or ALDUASDUBIS, in ancient geography, a river of Celtic Gaul, which, rising from Mount Jura, separated the Sequani from the Helvetii, and running through the county of Burgundy, or Franche Comte, environed almost on every side the city of Besançon; and falls into the Soare. It was also called Dubis: now le Doux.

ALDULPH, from *cald*, old, and *ulph*, help, Sax. an archbishop of Litchfield, in the end of the eighth century.

ALDUS, (Manutius,) a learned printer of the fifteenth century, to whom the world is indebted for numerous accurate and elegant im-

2 K

pressions of the classics. He was born at Bassano, and by his indefatigable and judicious pursuit of his profession, became the restorer of the Greek and Latin languages to Europe: he invented what is called, after his country, the *Italic* letter, and published an excellent Greek Grammar, besides abundant notes and commentaries on the principal ancient authors. He died at Venice in 1516. See MARUTIUS.

ALDWINKLE, ALL SAINTS, a small town of Northamptonshire, in the hundred of Huxloe, eighty miles from London, and the birth-place of the poet Dryden.

ALDWINKLE, ST. PETER, a town of Northamptonshire, in the Huxloe hundred, seventy-two miles from London, where the antiquary Fuller was born.

A L E.

ALE. Eale, from *ælaw*, to kindle and enflame. A liquor made by infusing malt and hops in hot water, and then fermenting the liquor.

Wel coude he knowe a draught of London ale.
Chaucer. The Prologue, v. i. p. 16.

For as sive keepeth ale,
Right so can Chestē kepe a tale,
All that he wote, he woll disclose,
And speke er any man oppose.

Gower, Con. A. book iii.
You must be seeing christenings. Do you look for ale and cakes here, you rude rascals?

Shakspeare's Henry VIII.

The fertility of the soil in grain, and its being not proper for vines, put the Egyptians upon drinking ale, of which they were the inventors. *Arbuth.*

Where village statesmen talk'd with looks profound,
And news much older than their ale went round.

Goldsmith's Deserted Village.

ALE, ol, Swedish: both, perhaps, being derived from the A. S. verb, as above, *ælaw*, to inflame, that well known fermented liquor, which in this country is obtained by fermentation from the malt of barley, a due mixture of hops, &c.

Countries to which nature has denied the richer juice of the grape, as a natural production, have in all ages cultivated some kind of substitute of this description. Hence from Egypt is said originally to have been derived *barley-wine*, and Herodotus attributes the first discovery of the art of brewing it to Isis, the wife of Osiris. Pelusium, situated on one of the mouths of the Nile, was particularly celebrated for its manufacture of malt liquors, of which there were two kinds, answerable very remarkably to our own popular liquors of ale and porter; the one called *carmi*, being sweet and glutinous, the other, named *zythum*, seems to have been analogous to modern beer. Dioscorides, the friend of Mark Antony and Galen, who flourished in the reign of Antonius Pius, were both well acquainted with ale; and from the testimony of Tacitus, it appears that the Germans were capable of preparing a liquor similar to wine, (*quandam vini speciem*), from barley, by fermentation. Julian, Strabo, and Polybius, show, that the same art was known to the Spaniards, the Gauls, the inhabitants of the British Islands, and the north of Europe. Our Anglo-Saxon ancestors placed one of their chief future felicities, in quaffing noble draughts of fermented malt liquors in the hall of Odin. But all the ancient malt liquors seem to have been made entirely of barley, or some other farinaceous grain, and therefore were not

generally calculated for long keeping, as this quality depends considerably, though not entirely, on the bitter extract of hops, or other vegetables, with which the liquor is mingled.

A beverage of this kind is well known to English law, and is to be traced in every record of ancient customs and festivities from the earliest periods. Lands were held on a rental in the ninth century, which included two tuns full of clear ale—a hundred loaves—ten mittan of Welch ale, &c. A cumb full of a third sort of ale, called *lithes*, or mild ale, is mentioned in Dugdale's Monasticon, as reserved in a grant of Offa; and a Saxon youth in *Æfric's Colloquies*, when asked what he drank, expresses a choice, not yet obsolete—‘ Ale if I have it, and water if I have it not.’ (M.S. Tab. 3, in the Cotton Library.) Ale is mentioned by Buchan as drunk in Scotland at a very early period, and called *vinum ex frugibus corruptis*. For modern laws respecting it, see the close of this article, **ALE-HOUSES, EXCISE, &c.**

The brewing of ale and beer of all kinds, is conducted by the same general process: the difference between them arising solely, in the first instance, from the different colour of the malt employed.

Good ale is commonly expected to be a light amber colour, brisk, and sweetish, or at least, not bitter to the taste; beer, in which we may include porter, is dark-coloured, much less brisk, and having a bitter taste, of a very peculiar nature. This last peculiarity, in fact, seems to render porter at once more agreeable to the palate, and more nutritive to persons who take strong exercise: it also renders it capable of being longer and better kept. Under the article **BREWING**, we shall enter more at large into the commercial and scientific relations of this subject; and the history of the astonishing increase of brewing-concerns in this country, especially in London: our present object is to treat it more familiarly; and, while exhibiting the real principles of the process, to assist their application to private and small concerns, rather than to those of the public and opulent brewers.

Ale is a wine of grain, distinguished, however, by containing a larger portion of mucilage and saccharine matter, and by the absence of super-tartrate of potash, a salt found in all wines expressed from the grape. As distinct from porter, ale contains also its farinaceous matter and saccharine mucilage in a more undecomposed state, which gives that clammy consis-

tency to the one, which we do not find in the other: and hence strong new ale becomes muddy by a mixture of alcohol which effects no perceptible change in porter.

As produced by a common process, all malt liquors contain a common chemical alcohol, or spirit. Professor Brande (Phil. Trans. 1811, p. 345.) found in the best Burton ale, 8.88 per cent of alcohol; in good home-brewed ale, 8.30; in three samples of Burton ale, 6.25; in Edinburgh ale, 6.70; in six samples of London ale, 5.82; in three of Scotch, 5.75; in Dorchester ale, 5.50. The best brown-stout, or London porter, yielded only 6.80, according to this celebrated chemist.

A fermented liquor of the ale kind is commonly made in America from Indian corn. In the interior of Africa, according to Mungo Park, from the seed of the *holcus spicatus*, (which yielded beer, says this traveller, equal to the best and strongest of our malt liquors), we have seen wheat and oat malts, and they have been occasionally tried in considerable breweries; in some countries in the north of Europe, a mixture of rye and barley is said to be used. But the grain which is unquestionably best adapted for malting and brewing purposes, is barley; (*hordeum vulgare*) and its Scottish variety big, or bear, (*hordeum hexastichon*) its germination being more easily effected, and its farinaceous matter more abundant and more readily convertible into saccharine than that of any other seed. The only ingredients of all good malt liquor, then, are malted corn, water, and hops. For MALTING, see that article.

We suppose a brewer, whether for public or domestic purposes, to possess himself of good malt and hops. Of the former, there are three different kinds in general use, namely, pale, brown, and amber, names derived from the colour, which depend on the mode of drying the malt. Pale malt differs little in colour from barley, it being dried by a very gentle heat, just so far as to put a stop to the vegetation of the grain.

Amber-coloured malt is, in all its properties, intermediate between pale and brown, and is so rendered by being dried with a greater heat. Brown malt differs from both in having been exposed to a still greater temperature; so that the outside of the flower is in a measure charred. Pale, and amber-coloured malt, not only affect the colour of the liquor brewed; but, in consequence of the chemical operations of the heat, applied on the principles that are developed in the grain, during the process of malting, materially alter the quality of the beer, especially with regard to the properties of becoming fit for drinking, and growing fine. The quality of malt differs according as it is more or less soaked, drained, germinated, dried, or baked, and the quality of the barley from which it is obtained. High dried malt contains a less quantity of matter capable of producing a vinous fluid, than the same quantity of pale malt. Hence the great breweries, even for porter, prefer the pale malt of Hertfordshire, and use a patent burnt malt in small quantities for colouring. If colour be wanted in domestic brewing, it may be more economically given by burnt sugar.

Hops, it is well known, are the seed, or flower-pods of the *humulus lupulus*, or hop-plant, which is cultivated in considerable quantities in the south of England, especially in Kent and Hampshire. They are collected when ripe, and dried on a kiln; then packed up in bags, and sold to the public. The peculiar bitter taste of hops, and a weak aromatic odour, possessing sedative qualities to a considerable extent, are their recommendations for brewing. A pillow, filled with hops, has often been found to induce sleep, when every thing else has failed. If they are distilled with alcohol, in a retort, there remains behind a solid green-coloured oil, of a sharp taste, and scarcely bitter, but putting one in mind of the peculiar flavour of good ale. This oil is the part of the hops which gives them their characteristic smell, and beer its distinguishing flavour. It is apt to be dissipated by long boiling. It does not appear, according to the opinion of some brewers, that the intoxicating qualities of ale are to be ascribed to the oil of the hop. The bitter principle of hops is easily extracted by water, and in no part of nature does it exist in greater perfection. 'No re-agent,' says Dr. Thompson, 'is capable of throwing it down excepting acetate of lead.' This taste, in all its peculiarities, is communicated to the wort of beer and ale, and the stronger the liquor, the more, of course, it will bear of this valuable addition. In brewing the best mild Edinburgh ale with sixty bushels of malt, yielding 11½ barrels of wort (measured when boiled completely) 40 lbs. of hops have been used; with 47½ bushels, yielding 10.83 barrels of wort, 36 lbs. of hops; with 60 bushels of malt from *big*—14.7 barrels of wort, 40 lbs. of hops. A common rule is to employ a pound of hops with every bushel of malt.

Let our brewer be now further provided with either a malt-mill, (the best of which is that in which the malt is bruised between iron rollers), or ground malt, and consider the whole of that valuable domestic and public art to be comprised under an attentive observation of this five-fold process, viz.: 1. Mashing. 2. Boiling. 3. Cooling. 4. Fermenting. 5. Cleansing.

I. OF MASHING.—He grinds his malt, say fifty bushels, and uses a copper boiler, whose solid contents amount to 382 ale gallons, being rather more than 107,521 cubic inches or, 62 $\frac{1}{4}$ cubic feet. This boiler must be placed over brick work upon a furnace, and there must be conveniences for filling it with water and for letting the water off, when sufficiently heated, into the mash-tun.

He must be provided also with a mash-tun, or wooden vessel composed of staves properly fixed by means of iron hoops, and generally placed in the middle of the brew-house. It usually has a false bottom full of holes at some little height above the true bottom, and to be capable of mashing fifty bushels of malt, must be at least one-third larger than the bulk of the malt, or capable of containing seventy-five bushels.

Into the boiler is to be put a quantity of water equal, at least, in bulk to that of the malt, and heated up to 190°, or 180°, according to the judgment of the brewer and the quality of the malt. But the best brewers employ the lower temperature. This water is then to be let into

the mash-tun, and the malt, previously ground, to be let down into it immediately after. All the clots are now carefully broken, and mixed with the water by narrow wooden shovels, or, when the capacity of the mash-tun is great, by machinery. Great care must be taken to break all the clots, because the whole of the malt within them would otherwise escape the action of the water, and be lost to the brewer. When the water and malt are sufficiently mixed, the mash-tun is covered and left in this state about three hours. But the time varies according to circumstances. To what degree the temperature of the water is lowered when thus mixed with the malt, it is difficult to ascertain, from the impossibility of inserting a thermometer into the centre of the mash-tun. But fifty-one bushels of water at the temperature of 192° , mixed with $47\frac{1}{2}$ bushels of malt, have afterwards given the temperature at the surface of the mash 140° . When the wort began to run off, two hours and a half after, its temperature was 156° ; and at that time the surface of the mash was at 136° . Thus, perhaps, the whole mash lost four degrees as well as the surface, and the mean between the bottom and top, will give for the mean heat of the whole after the mashing, 150° : so that the water has lost thirty-two degrees of heat, while the malt (its temperature before mixture was 48°) gained 102° ; which makes the specific heat of the malt, 0.69, rather above, probably, than under the truth. The mash having continued for about three hours, longer or shorter according to circumstances, a stop-cock, placed below the false bottom in the mash-tun, is opened, and the wort allowed to run out into a vessel prepared to receive it, known by the name of the underbeck. At the same time the cover is taken off the mash-tun, and quantities of water, of the temperature of 180° , are occasionally sprinkled over it from the boiler, which had been again filled with water to be heated, as soon as the water for mashing was drawn off. No specific directions can be given respecting the quantity of hot-water added in this manner by sprinkling, because that must depend upon the views of the brewer. If he wishes to have ale of great strength, he will of course add less water; if the ale is to be weak he will add more. The best way is to determine the strength of the liquor as it flows into the underbeck by means of a saccharometer, or by taking its specific gravity. When the specific gravity (at sixty degrees) sinks to 1.04 or 1.05, or when it contains only $36\frac{1}{2}$ or $46\frac{1}{2}$ lbs. per barrel of solid matter in solution, it would be useless or injurious to draw any more off for making strong ale. But an additional portion may still be drawn off and converted into small beer.

No general rule can be laid down for the specific gravity or strength of the wort, when it begins to flow from the mash. It will depend upon the goodness of the malt, and upon the quantity of mashing water employed, when compared with the quantity of malt. The following gravities have been taken at this period of the process: 1.084, 1.0805, 1.0815, 1.0835, 1.091, 1.094; or containing respectively $78\frac{1}{4}$, 74, $75\frac{1}{2}$, 78, 85, and $87\frac{1}{4}$ lbs. per barrel. When it first flows from the mash-tun, the wort is a trans-

parent liquid of a fine amber colour, a peculiar smell, and a rich, luscious, sweet taste. If it is cloudy, it is a proof that the water used for mashing was of too high a temperature. We have seen the wort run cloudy from the mash-tun, when the temperature of the water had been as high as 200° , or 191° , but never when it was no higher than 180° . This affords an additional reason with the brewers for keeping the temperature of the mashing-water low. But we have doubts about the accuracy of the reason; and it must be acknowledged, that some obscurity hangs upon this part of the process of brewing. For worts will sometimes continue opaque during the whole process of boiling, cooling, and fermenting, and require ultimately to be clarified, or fined, as the brewers term it, by means of isinglass. The substance which renders ale in this case turbid, seemed to be a variety of starch, or some particular form of that substance; for it has been completely precipitated by infusion of nutgalls, and the precipitate redissolved by the application of a moderate heat. A quantity of wort like that of which we have been treating, takes from six to eight hours in flowing from the mash-tun. As it flows on its colour diminishes to a light yellow, the smell is less pleasing, and the taste not so sweet. The wort which first comes off, evaporated to dryness, leaves a yellow-coloured residuum, of a sweet taste, which dissolves readily in water, absorbs water from the atmosphere, and becomes clammy, and similar in appearance to treacle. Its specific gravity is 1.552. There can be no doubt that this residue contains a good deal of sugar, to which it nearly approximates in gravity, and is precisely the same in its properties with the sugar into which starch is converted by a very dilute acid. But it is mixed likewise with a considerable portion of starch. The chemical constitution of wort is in fact threefold: 1. Saccharine matter, which is perhaps the base or essential constituent. 2. Starch, which is instantly detected by dropping in a solution of iodine, that produces a blue precipitate. 3. Mucilage, which is precipitated in flakes when the wort is poured into alcohol. This abounds more in the last drawn off wort than the first; and readily passes into the acetous fermentation; consequently the flavour of our malt-liquor is improved, if we take only for the best ale, the wort that runs off first.

II. We now arrive at another important step in our process, BOILING the wort. Being raised by means of pumps from the underbeck into the copper boiler, the wort is boiled for several hours, till it has acquired a strength of which the brewer judges according to his views, and by scientific instruments. Thus from fifty bushels of malt 13.444 barrels of wort are to be obtained, of the specific gravity 1.068, or of 63.125 lbs. of saccharine matter per barrel: and it may be boiled down to 11.083 barrels of the specific gravity 1.1015, or of $94\frac{1}{2}$ lbs. per barrel. From 60 bushels of malt, 23.465 barrels of wort, of the strength of 64.37 lbs. per barrel, or of the specific gravity 1.0683: and it may be boiled down to 19.736 barrels of the strength of 82.7 lbs. per barrel, or of the specific gravity

1,080. From sixty bushels of big malt 23.8193 barrels of the specific gravity 1.0648, or of 53.75 lbs. per barrel of saccharine matter; boiling down to 19.736 barrels of the specific gravity 1.078, or of 72 $\frac{1}{2}$ lbs. per barrel of saccharine matter.

The hops are added while the wort is in the boiler, according to the strength of the wort, and the time it is designed to keep the beer, which is sometimes called *hopping* the wort. The hop coagulates the excess of mucilage and glutinous matter which is extracted from the malt in mashing, for if this were suffered to remain in solution in the beer, it would never become fine, but would always be cloudy: the boiling hardens this substance in the same manner as the white of an egg acquires solidity by boiling. This coagulation is called the *breaking* or curdling of the wort. The boiling must therefore always continue till the breaking appears. Another object is attained by the hops in the operation of boiling, namely, the concentration of the wort. Its bulk becoming reduced by evaporation, which merely carries off a portion of water, the original quantity of fermentable matter remains concentrated in a smaller space.

III. The wort having been boiled down to the requisite strength, it is let down into the COOLERS, or shallow floors of wood, surrounded with a wooden ledge, and water-tight, placed in the most airy and exposed situation in the brewery; to hold the whole of the wort at a depth not exceeding three or four inches. The object is to cool down the wort, as rapidly as possible, to the temperature of the atmosphere; because, if it were allowed to remain long hot, it would run the risk of becoming sour, and spoil the whole process. The superiority of many breweries consists in the construction of the coolers, or, upon their being as well adapted as possible for speedily reducing the temperature of the wort. They must be kept perfectly clean, and a free current of air should pass over them.

Rather more than one-fourth of the whole wort is dissipated by evaporation during the cooling. When the wort is let out of the boiler into the cooler, the hops still remain, and, as they are soaked with wort, a considerable loss would be sustained if they were thrown away. Thus 45 lbs. of hops have retained half a barrel of wort after they were drained so completely that no more wort would drop out. In another case, 35 lbs. of hops, retained in the same way, 9.3666 of a barrel, which is rather more than one-third of a barrel. To recover this wort it is proper to subject the hops to pressure. By some brewers this circumstance is too much neglected.

Where the brewery is small, and, from the weather or otherwise, the apartment in which the fermenting vessels are placed is cold, it is proper not to reduce the temperature of the wort lower than 56°. When the apartment in which fermentation is carried on is warm, 51° or 52° is a very good temperature. If a brewer is obliged to make ale in warm summer weather, it is material to reduce the temperature as low as possible.

IV. The wort being now sufficiently cooled

down by exposure, it is let down into the FERMENTING TUNS, or, as the brewers call them, the gyle-tuns, in order to be fermented; by which process, it is converted from the luscious sweet-tasted liquor called wort, to the brisk intoxicating liquor which constitutes ale. The gyle-tuns are cylindrical wooden vessels, varying in size, according to the extent of the brewery. In London breweries and distilleries, they are of prodigious size; but in private houses they often do not exceed the size of a wine hogshead, or even of a beer barrel. The fermentation is perhaps conducted with the greatest economy in larger vessels; but good ale may be made in comparatively small quantities. Good porter has scarcely ever been made, except by those who manufacture it upon a large scale. The fermenting tuns are never filled by the wort; because a considerable increase in bulk takes place during the fermentation, in consequence of which the liquor would run over, unless allowance were made for it: and the fermentation of ale or beer is never carried to any great length. The object is, to retain the flavour and good qualities of the ale or beer, not to develope the greatest quantity of spirit, which can hardly be done without allowing the wort to run into acidity.

The strength of the fermentation depends upon the quantity of yeast used. This is a frothy substance, of a brownish-grey colour, and bitter taste, formed on the surface of ale or wine while fermenting. If it be put into sacks, the moisture gradually drops out, and the yeast remains behind in a solid form, of the flavour and taste of cheese, but darker in its colour.

Mr. Westrumb is the only chemist who has subjected yeast to an analysis; and this is so far back as the year 1796. He obtained from 15,360 parts of fresh beer,

Of Potash	13
Carbonic acid	15
Acetic acid	10
Malic acid	45
Lime	69
Alcohol	240
Extractive	120
Mucilage	240
Saccharine matter	315
Gluten	480
Water	13,595
	15,142
Loss	218
	15,360

A gallon of yeast is generally allowed to about three barrels of wort: 'one gallon to every sixteen barrels of ale or porter,' says a London brewer. In about five or six hours after the yeast has been added, the fermentation begins. Its first appearance is a white line or border on the surface of the liquor, commencing at the sides of the tun, and gradually covering the surface of the liquor with a white scum.

Air bubbles separate from it, and a froth, of a yellowish-grey colour, collects slowly. In a few days, especially if the weather be warm, it collects in considerable quantities. At the same time, the temperature of the wort increases, and

it yields a very considerable quantity of carbonic acid gas. The increase of temperature which takes place during the fermentation of ale may be stated, at an average, to amount to twelve or fifteen degrees. Sometimes it amounts to twenty, and sometimes does not exceed five degrees; though in such cases, there is generally some deficiency in the skill of the brewer.

Fermentation, indeed, is the great secret of the brewer's art, and the true theory of it, has occupied the attention of chemists ever since the manufacture of ale began to be attended to by men of science. Lavoisier was the first person who attempted to offer any thing like a theory of this intricate process. He endeavoured to determine the composition of common sugar, a substance which may be fermented just as well as the soluble part of malt, and which yields similar products, and ascertained the constituents of alcohol, the substance formed by fermentation. On the whole, he formed a plausible theory, but valuable chiefly as a first approximation, though there can be little doubt that it was erroneous in every particular. Since that time, several experiments on the subject have been made by Thenard, Gay Lussac, and Berzelius, which have more accurately determined the constituents of sugar; and Theodore de Saussure has made very elaborate, and, we believe, accurate, experiments on the composition of alcohol. The general theory, as resulting from experiments on common sugar, and on the saccharine matter of malt, may be thus stated.

A weak solution of sugar in water kept in a warm place will ferment of itself. The solution of sugar of grapes in water ferments still more speedily; as also does sugar of starch; and the saccharine matter of malt. In a general view of fermentation, therefore, we may leave out the small quantity of yeast; because it is not absolutely necessary, but seems merely to render the effect more rapid, and thus to prevent the change of the liquid into acidity.

In complete fermentation the sugar disappears altogether, and two new substances are found in its place, carbonic acid and alcohol. According to Lavoisier's experiments, 100 parts of sugar yielded, when fermented,

Alcohol	57.70
Carbonic acid	35.34

The specific gravity of his alcohol could scarcely be less than 0.825 such alcohol contains at least eleven per cent. of water; for that quantity has been actually extracted from it. From Saussure's experiments, it is probable that the real quantity of water contained in alcohol of the specific gravity 0.825, is 18.387 per cent. or almost a fifth. On this supposition, sugar, according to Lavoisier's experiments, yields

Alcohol	47.1
Carbonic acid	35.34
	82.44
or per cent.	
Alcohol	57.1
Carbonic acid	42.9
	100.0

Thenard mixed sixty parts of yeast with 300 of sugar, and fermented the mixture at the temperature of fifty-nine degrees. He informs us that in four or five days all the saccharine matter had disappeared. The quantity of carbonic acid evolved amounted by weight to 94.6 parts. It was perfectly pure, being completely absorbed by water. The fermented liquid being distilled, yielded 171.5 parts of alcohol, of the specific gravity 0.822. When the residue of the distillation was evaporated, twelve parts of a nauseous acid substance remained, and forty parts of the yeast still continued unaltered in appearance, though Thenard assures us that it had lost the whole of its azot. Thus the products of the fermentations were

Alcohol of 0.822	171.5
Carbonic acid	94.6
Nauseous residue	12.0
Residual yeast	40.0
	318.1
Loss	41.9

Total 360.0

But the nauseous residue and residual yeast, making up nearly the quantity of yeast employed, we need only consider the products of decomposed sugar, supposing the loss to be proportionally divided between the carbonic acid and alcohol. Now alcohol, of the specific gravity 0.822, contains one-tenth of its weight of water, which can be separated from it; and if we suppose with Saussure, that absolute alcohol contains 8.3 per cent. of water, then the products of sugar decomposed by fermentation, according to this philosopher's experiments, are

Alcohol	47.70
Carbonic acid	35.34
	83.04

or, in 100 parts

Alcohol	57.44
Carbonic acid	42.56

100.00

A result approaching so near to that of Lavoisier, as decidedly to confirm the general truth of both calculations. Dr. Thompson, of Edinburgh, from comparing the foregoing experiments, with additional ones of his own, on the saccharine of malt, concludes that the alcohol, or pure spirit, yielded therefrom, when fermentation is properly conducted, is almost exactly one half.

Languid fermentation is to be accelerated by *rousing*, as it is called, or beating in the yeast, which is formed on the top of the liquor, by raising the temperature, &c. If the fermentation is suddenly checked, the beer becomes what is called grey, or never fine. Worts made with water too highly heated, are particularly liable to this malady.

At the completion of the fermentation, which may be taken at about forty or forty-five hours in general cases, (but it depends greatly on the temperature of the atmosphere and the strength of the liquor,) the saccharometer swims deeper on the wort, from the decomposition of the saccharine matter and the production of alcohol being carried

to their height. In the brewing of porter, the fermentation is suffered to proceed until the head of yeast that floats on the surface of the liquor assumes an uniform and compact appearance, and does not float any higher. In the brewing of ale, it is seldom suffered to advance to quite such a degree. In ale, of which the specific gravity amounts to 17.25, or eighteen pounds per barrel, it is stopped by most brewers when the gravity is reduced from seven to nine pounds per barrel. If the beer is meant to be full bodied or hard, the fermentation must be conducted slowly, that is so far as consistent with the richness of the wort; if it is intended to be brisk, the fermentation is stopped the earlier.

If now the wort were allowed to remain in the gyle-tun, the yeast would again mix with it; and the consequence would first be, a disagreeable bitter taste, known among brewers by the name of *yeast bitter*; the fermentation would proceed, though in a languid manner, and the ale would soon run into acidity. These accidents are prevented by drawing off the ale into small casks. This is called

V. CLEANSING. The casks are to be filled quite full, and left with their bungs open. The drawing off of the ale from the gyle-tun lowers its temperature, and, of course, checks the fermentation. Sometimes, therefore, the cleansing is practised in summer, when the elevation of temperature in the wort is at its height. The ale continuing to ferment after it is put into casks, the yeast, as it comes to the surface, flows out at the bung, and thus separates altogether from the beer. It is this separation that has induced brewers to distinguish it by the name of cleansing. In these casks, then, the yeast divides itself into two portions. The greatest part rises up with the carbonic acid evolved, and flows out at the bung-hole; while another portion subsides to the bottom, and constitutes what is called the dregs of the beer. It is essential to the cleansing, that the casks should be always full, otherwise the yeast will not run off, and the beer will not become transparent. This object is accomplished in small breweries by a man constantly going round, and filling up the casks as they work down; but in large breweries, by mechanical contrivances, according to their scale of business. When the fermentation has subsided, the beer will in general be found transparent: is bunged up in the cask, and preserved for sale or use.

The filling up of the casks, if the beer works briskly, should be attended to every two or three hours at least, for the first fourteen or fifteen hours, after which the fermentation will subside, in a great degree, and therefore less attention becomes requisite; but, until the fermentation appears wholly to have ceased, yeast should be added according to the strength of the beer, the state of the weather, &c. This will generally be in about forty or sixty hours. Well-fermented beer, especially that designed for private use, generally becomes fine of itself; but the various changes of place, &c. that attend beer brewed for the public, have induced the general use of isinglass as a *fining* or assistance to the depositing of the portions of flocculent glutinous

matter remaining in it. They are prepared as follows, and will be seen to be perfectly innocuous: The pickings of book, or leaf-isnglass, are thrown into a wooden tub, and when the tub is about one-third full, it is filled up with good stale small beer, which soon dissolves the isinglass. It is then rubbed through a sieve, and all the hard lumps picked out, the mass is reduced to a proper consistence for use by the addition of a further quantity of good sharp beer. When used for fining, it must be well stirred, and in the course of a few hours, the liquor may be drawn off clear and bright; one pint is the usual proportion to a barrel of beer, but sometimes two and even three, are necessary.

The age at which ale is drank, will depend upon a private person's stock; the size of his cellar, &c. but more frequently upon his family habits, and the pecuniary means he chooses to devote to this beverage. Good mellow ale, soft and fine, may be had at a year old; and it is, perhaps, never better than from one year old to two. Some persons never reckon ale to be old, unless it drinks a little hard, or with some, approaches to sharpness, or acidity; but this is a false taste: old ale in this sense, it has been well said, is old ale spoiled.

After all, a hogshead or pipe of ale, that has been properly brewed and carefully managed, will not always be fine when tapped. Suppose it be a year old, or what is more common, suppose it to be brewed in October (the best month in which to brew good ale for keeping), and tapped at the Christmas twelve-month following; if when tapped it be not fine, it may be corked up again, and stand another twelve-month, when it will probably be found not only fine, but greatly improved in flavour; but if it be wanted, it may be fined as follows: draw off a gallon or two, if the cask be a pipe, and take a quarter of a pound of isinglass, and some fresh hops, and scald them in a clean copper pan, dissolving the isinglass therewith; pour the quantity into a dry pail, and when cool put it into the barrel, and stir the whole together well with a long stick, or such an one as you have head-way to introduce; bung down the cask a few hours afterwards, and in a fortnight the ale will become fine. If the ale drink thin, and incline to be hard, let a pound or two, or more if required, of sugar-candy, bruised, be put into the pan with the hops, &c.

The method called *marrying ale*, we have often seen tried upon a private person's stock with success. It seems to increase its strength, but especially its mellowness and the fulness of its flavour, and consists in tapping a pipe or hogshead of ale in the middle, and when it is drawn as low as the tap, to fill up the cask with another brewing of wort. The particulars to be observed are: to begin upon a sound stock, such as is approved as to colour and flavour; for if there be any approach to acidity it will not do. The next point is to tun the newly-fermented wort upon the old stock, when it has fermented about twelve hours. The third particular, of great importance, seems to be, not to marry your ale in winter, but in autumn (October), for

if your cellar be not a vault, the old stock is too chill, and the fermentation may suddenly stop : if this should happen, as in cellars that are not vaults, the heat may increase considerably in spring, the fermentation may be renewed, and the ale may spoil, or mischief happen to the cask by bursting. Ale that is brewed in the usual way will sometimes ferment in summer, and throw up the bungs of the barrels ; especially if the fermentation have been hastily conducted, and little or no cleansing have taken place in the barrels after tunning (which is likely to be the case when brewing is performed in frosty weather) ; where this happens, the danger is that acidity will follow, and therefore the beer should be speedily used. When ale is married, the fermentation will bring away all the old hops, and it is not to be overlooked that the cork will rise that had been driven in with the tap. It is, therefore, requisite to work it out at thebung-hole, skimming away the hops, &c. till they and the cork are discharged ; then fill up the cask, and take out the top cork for cleansing, as before. It may be filled up several times with fresh wort, as in other cases, until the fermentation stops, and then the cork and bung put in (the latter very lightly) and left so until it is necessary to hop it down. The writer has refilled a cask in this manner five years successively, and had the ale always superior, and always alike in colour and flavour ; in continuing this practice for a long period it is necessary to remove the casks for fear of accidents. The excellence of this ale is, that you can never guess at its age ; it drinks always soft and mild, without any resemblance to ale recently brewed, and is equally remote from hardness or acidity.

Although we have pursued a train of reasoning and observations in this article which will apply to brewing on any scale, we cannot close it without particularly urging on the small farmer and cottager, even the labouring cottager, to endeavour to furnish himself with the beverage of his ancestors, home-brewed beer. ‘In former times,’ says Mr. Cobbett, in the most useful of his works we have seen, ‘to set about to show to Englishmen that it was good for them to brew beer in their own houses, would have been as impertinent as gravely to insist that they ought to endeavour not to lose their breath ; for, in those times, only forty years ago, to have a house and not to brew was a rare thing indeed. Mr. Elliman, an old man and a large farmer, in Sussex, has recently given in evidence before a committee of the House of Commons this fact, that forty years ago, there was not a labourer in his parish that did not brew his own beer ; and that now, there is not one that does it, except by chance the malt be given him. The cause of this change has been the lowering of the wages of labour, compared with the present price of provisions, by the means of the paper money, the enormous tax upon the barley when made into malt, and the increased tax upon hops. These have quite changed the customs of the English people as to their drink. They still drink beer, but, in general, it is of the brewing of common brewers, and in public houses, of which the common brewers have become the owners, and have thus,

by the aid of paper-money, obtained a monopoly in the supplying of the great body of the people, with one of those things, which to the hard-working man, is almost a necessary of life.

‘At present prices of malt and hops,’ continues this powerful writer, ‘home brewed beer is the cheapest drink that a family can use, except milk, and that can be applied only in certain cases. The drink, which has come to supply the place of beer has, in general, been tea. It is notorious, that tea has no useful strength in it ; that it contains nothing nutritious ; that it, besides being good for nothing, has badness in it, because it is well known to produce want of sleep in many cases, and, in all cases, to shake and weaken the nerves. It is, in fact, a weaker kind of laudanum, which enlivens for the moment and deadens afterwards. At any rate it communicates no strength to the body ; it does not, in any degree, assist in affording what labour demands. It is, then, of no use. And, now, as to its cost, compared with that of beer, I shall make my comparison applicable to a year, or three hundred and sixty five days. I shall suppose the tea to be only five shillings the pound ; the sugar only seven-pence ; the milk, only two-pence a quart. The prices are at the very lowest. I shall suppose a tea-pot to cost a shilling, six cups and saucers two shillings and six-pence, and six pewter spoons eighteen-pence. How to estimate the firing I hardly know ; but certainly there must, in the course of the year, be two hundred fires made that would not be made, were it not for tea drinking. Then comes the great article of all, the time employed in this tea-making affair. It is impossible to make a fire, boil water, make the tea, drink it, wash up the things, sweep up the fire place, and put all to rights again in a less space of time, upon an average, than two hours. However, let us allow one hour ; and here we have a woman occupied no less than three hundred and sixty-five hours in the year, or, thirty whole days, at twelve hours in the day ; that is to say, one month out of the twelve in the year, besides the waste of the man’s time in hanging about waiting for the tea ! Needs there any thing more to make us cease to wonder at seeing labourers’ children with dirty linen and holes in the heels of their stockings ? Observe, too, that the time thus spent, is one half of it the best time of the day. It is the top of the morning, which, in every calling of life, contains an hour worth two or three hours of the afternoon. By the time that the clattering tea tackle is out of the way, the morning is spoiled ; its prime is gone ; and any work that is to be done afterward lags heavily along. If the mother has to go out to work, the tea affair must all first be over. She comes into the field, in summer time, when the sun has gone a third part of his course. She has the heat of the day to encounter, instead of having her work done, and being ready to return home at an early hour. Yet early she must go, too ; for, there is the fire again to be made, the clattering tea tackle again to come forward ; and even in the longest day she must have candle light, which never ought to be seen in a cottage (except in cases of illness) from March to September.

Now, then, let us take the bare cost of the use of tea. I suppose a pound of tea to last twenty days, which is not nearly half an ounce every morning and evening. I allow for each mess half a pint of milk. And I allow three pounds of the red dirty sugar to each pound of tea. The account of expenditure would then stand very high; but to these must be added the amount of the tea tackle, one set of which, will, upon an average, be demolished every year. To these out-goings must be added the cost of beer at the public house; for some the man will have after all, and the woman, too, unless they be upon the point of actual starvation. Two pots a week is as little as will serve in this way; and here is a dead loss of ninepence a week, seeing that two pots of beer, full as strong, and a great deal better, can be brewed at home for three pence. The account of the year's tea drinking will then stand thus:

18lbs. of Tea	£4	10	0
54lbs. of Sugar	1	11	6
365 Pints of Milk	1	10	6
Tea tackle	0	5	0
200 Fires	0	16	0
30 Day's works	0	16	0
Loss by going to public-house	1	18	0

£11 7 2

I have here estimated every thing at its very lowest. The entertainment which I have here provided is as poor, as mean, as miserable, as any thing short of starvation can set forth; and yet the wretched thing amounts to a good third part of a good and able labourer's wages. For this money, he and his family may drink good and wholesome beer; and, in a short time, out of the mere savings from this waste, may drink it out of silver cups and tankards. In a labourer's family, wholesome beer, that has a little life in it, is all that is wanted in general. Little children, that do not work, should not have beer. Broth, porridge, or something in that way, is the thing for them. However, I shall suppose, in order to make my comparison as little complicated as possible, that he brews nothing but beer as strong as the generality of beer to be had at the public house, and divested of the poisonous drugs which that beer but too often contains; and I shall further suppose that he uses in his family two quarts of this beer every day from the first of October to the last day of March inclusive; three quarts a day during the months of April and May; four quarts a day during the months of June and September; and five quarts a day during the months of July and August; and if this be not enough it must be a family of drunkards. Here are 1097 quarts, or 274 gallons. Now, a bushel of malt will make eighteen gallons of better beer than that which is sold at the public houses. And this is precisely a gallon for the price of a quart. People should bear in mind, that the beer bought at the public house is loaded with a beer tax, with the tax on the public house keeper, in the shape of license, with all the taxes and expenses of the brewer, with all the taxes, rent, and other expenses of the publican, and with all the profits of both brewer and publican; so that when a man swal-

lows a pot of beer at the public house, he has all these expenses to help to defray, besides the mere tax on the malt and on the hops.

Well, then, to brew this ample supply of good beer for a labourer's family; these 274 gallons require fifteen bushels of malt, and, (for let us do the thing well) fifteen pounds of hops. The malt is now eight shillings a bushel, and very good hops may be bought for less than a shilling a pound. The grains and yeast will amply pay for the labour and fuel employed in the brewing; seeing that there will be pigs to eat the grains, and bread to be baked with the yeast. The account will then stand thus:

15 bushels of Malt	£6	0	0
15 pounds of Hops	0	15	0
Wear of Utensils	0	10	0
			£7 5 0

Here, then, is four pounds, two shillings and two pence, saved every year. The utensils for brewing are, a brass kettle, a mashing tub, coolers, (for which washing tubs may serve), a half hogshead, with one end taken out for a tun tub, about four nine gallon casks, and a couple of eighteen gallon casks. This is an ample supply of utensils, each of which will last, with proper care, a good long life time or two, and the whole of which, even if purchased new from the shop, will only exceed by a few shillings, if they exceed at all, the amount of the saving arising the very first year, from quitting the troublesome and pernicious practice of drinking tea. The saving of each succeeding year would, if you choose it, purchase a silver mug to hold half a pint at least. However, the saving would naturally be applied to purposes more conducive to the well being and happiness of a family.

'It is not, however, the mere saving to which I look,' adds Mr. Cobbet, 'this is, indeed, a matter of great importance, whether we look at the amount itself, or at the ultimate consequences of a judicious application of it; for, four pounds makes a great hole in a man's wages for the year; and when we consider all the advantages that would arise to a family of children from having these four pounds, now so miserably wasted, laid out upon their backs in the shape of decent dress, it is impossible to look at this waste without feelings of sorrow, not wholly unmixed with those of a harsher description. But, I look upon the thing in a still more serious light. I view the tea drinking as a destroyer of health, an enfeebler of the frame, an engenderer of effeminacy and laziness, a debaucher of youth, and a maker of misery for old age. In the fifteen bushels of malt, there are 570 pounds weight of sweet; that is to say of nutritious matter, unmixed with any thing injurious to health. In the 730 tea messes of the year, there are fifty-four pounds of sweet in the sugar, and about thirty pounds of matter equal to sugar in the milk. Here are eighty-four pounds, instead of 570, and even the good effect of these eighty-four pounds is more than over balanced by the corrosive, gnawing, and poisonous powers, of the tea.'

It is impossible for any one to deny the truth of this statement. Put it to the test with a lean hog: give him the fifteen bushels of malt, and

he will repay you in ten score of bacon or thereabouts. But give him the 730 tea messes, or rather begin to give them to him, and give him nothing else, and he is dead with hunger, and bequeaths you his skeleton at the end of about seven days. It is impossible to doubt in such a case.' COBBETT'S *Cottage Economy, containing Information relative to the brewing of beer, making of bread, keeping of cows, pigs, bees, ewes, goats, poultry, and rabbits; and relative to other matters deemed useful in the conducting of the affairs of a labourer's family.*' We have cited the whole of his title, for this little work is really described by it, and cannot be too widely circulated among the classes for whom it is designed. Of course it must be read with due allowance for Mr. Cobbett's occasionally wild and ever-varying political doctrines.

The following method for preserving ale from turning sour in long voyages, was first published by Dr. Stubbs in his Phil. Trans. No. 27. To every runlet of five gallons, after being placed in a cask on ship-board not to be stirred any more, put in two new-laid eggs whole, and let them lie in it. In a fortnight, or a little more, the egg shells will be entirely dissolved, and the eggs become like wind-eggs enclosed only in a thin skin; after this the white is preyed on, but the yolks are not touched or corrupted; and by these means the ale has been so well preserved, that it was found better in Jamaica than at Deal.

To give the reader an opportunity of comparing the quantity of ale and porter drank in London, we subjoin

A table exhibiting the quantity of strong ale and porter brewed by the seven principal houses in London, in the year ending the 5th of July, 1815.

PORTRER.	Barrels.	ALE.	Barrels.
Barclay and Perkins	337,621	Wyatt	27,094
Meux, Reid, and Co.	282,104	Charrington and Co.	22,146
Trueman, Hanbury, and Co.	272,162	Goding and Co.	20,444
F. Calvert, and Co.	219,333	Stretton and Co.	14,491
Whitbread, and Co.	261,018	Hale and Co.	10,134
H. Meux and Co.	223,100	Ball and Co.	7,985
Combe	105,081	Thorpe and Co.	5,433
	1700,419		107,727

Giving the great difference of 1592,692 barrels in the consumption of these two descriptions of malt liquor in and about the metropolis.

* THE FOLLOWING ARE THE LAST YEARS' RETURNS.

A table exhibiting the quantity of strong ale and porter brewed by the six principal houses in London, in the year ending the 5th of July, 1825.

PORTRER.	Barrels.	ALE.	Barrels.
Barclay and Perkins	337,446	Goding and Co.	28,292
Trueman, Hanbury, and Co.	223,766	Wyatt and Co.	20,193
Whitbread and Co.	203,842	Charrington and Co.	16,795

H. Meux and Co.	108,948	Hale and Co.	8,006
	1230,997		100,953

Giving the difference of 1130,044 barrels in the consumption of these two descriptions of malt liquor in and about the metropolis.

ALES, in church history and ancient customs, were variously denominated. From the predominance of this old English beverage in the feasts of the people, the entertainments given passed by the names of the bridal-ale, leet-ale, lamb-ale, Whitsun-ale, &c. denoting respectively a wedding feast, an entertainment at the court-leet of a manor, at lamb-shearing, &c.

CHURCH-ALES were feasts established by custom or authority in the neighbourhood of a church, for the double purpose of regaling the people, and gathering from them contributions to its repair, the honour of the patron-saint, &c. They are described by Pierce, bishop of Bath and Wells, in his answer to the enquiries of archbishop Laud, as celebrated when the people go from after-noon prayers on Sundays to their lawful sports and pastimes in the church-yard, or in the neighbourhood, or in some public-house where they drink and make merry. By the benevolence of the people at these pastimes, many poor parishes are said to have cast their bells and beautified their churches, and raised stock for the poor. See *Warton's English Poetry*, vol. iii. &c.

CLERK-ALES, or lesser church-ales, were so called because they were for the better maintenance of the parish-clerk; ‘and there is great reason for them,’ says his lordship, ‘for in poor country parishes, where the wages of the clerk are but small, the people thinking it unfit that the clerk should duly attend at church, and not gain by his office, send him in provision, and then come on Sundays and feast with him, by which means he sells more ale, and tastes more of the liberality of the people, than their quarterly payment would amount to in many years; and since these have been put down, many ministers have complained to me,’ he adds, ‘that they are afraid they shall have no parish-clerks!'

A **BID-ALE** was held on behalf of poor men, decayed in substance, and set up again by the liberal benevolence and contribution of friends at a Sunday's feast. The people were fond of these recreations, and the above-mentioned prelate recommended them, as bringing the people more willingly to church, tending to civilize them, to compose differences among them, &c. But the justices of the peace were of a different opinion, and signed a petition to the king, in which they declare that these revels had not only introduced a great profanation of the Lord's day, but riotous tippling, contempt of authority, quarrels, murders, &c., and were very prejudicial to the peace, plenty, and good government of the country, and therefore they pray that they might be suppressed. Two judges in the western circuit, in 1653, made an order for suppressing them; but archbishop Laud complained to king Charles I. of their invading the episcopal jurisdiction, and they were summoned before the council, reprimanded, and enjoined to revoke this order at the next assizes.

ALE-CONNER, an officer of the city of London, appointed by common-hall, whose duty it is to taste and judge of the quality of the ale sold within the jurisdiction of the city, and to regulate the ale-measures of the public-houses. There are four of these officers chosen every Midsummerday.

ALE AND BEER DUTIES make a considerable

branch of the revenue in England. They were imposed in 1643, at the first establishment of the excise, again by Car. II. and have been continued by several subsequent acts of parliament. By 43 Geo. III. c. 69, for every barrel of beer or ale brewed for sale, above sixteen shillings a barrel, exclusive of the duty hereby imposed, and not being two-penny ale, nor table-beer, the brewer shall pay ten-shillings; and for every barrel of table-beer, or beer or ale of sixteen shillings the barrel, or under (exclusive of the duty), two-shillings; and for every barrel of two-penny ale, (described in the seventh article of the Union with Scotland) four shillings and two-pence. The allowance for waste shall be three gallons out of thirty-six gallons, which shall be reckoned a barrel of beer or ale made by common brewers. These duties the private brewer for his own consumption, entirely escapes.

ALE-HOUSES are licensed yearly by the justices of peace of a county, or supreme magistrates of a city, for the sale of ale or beer. The occupiers of such houses are bound in recognizances that no riot or disorderly conduct shall take place in them; and their licences, upon misconduct, or the forfeiture of such recognizances, may be taken away at the pleasure of the magistrates granting them. By 26 Geo. II. c. 41, justices on granting licences, are to take recognizances in £10, with sureties in the like amount, for the maintaining good order. Certificates of good character are to be given before any new licence is granted; and the penalty for selling ale, &c. without licence is, by this and subsequent acts, fixed at forty shillings for the first offence; for the second, four pounds; and the third, six pounds. For suffering tippling in such houses, they are to be fined ten shillings. At wakes or fairs, however, ale may still be sold indiscriminately, and without a licence. No persons, otherwise than as above mentioned, are to sell wine to be drank in their own houses without an ale licence as well as a wine licence. But persons who sell ale or beer in casks not less than five gallons, and in bottles (reputed quarts) not less than two dozen, and not to be drank in their own houses, are exempted from the penalties of retailing without a licence. By 48 Geo. III. c. 143, the stamp duties on ale licences are repealed, and excise duties, to be paid annually, granted on them in lieu thereof.

ALE MEASURES are to be regulated by the standard quart and pint preserved in his majesty's exchequer; sub-commissioners and collectors of excise are to provide full and substantial ale quarts and pints in every town of their division, and the mayors or chief magistrates to mark the measures from the standard, or forfeit five pounds by stat. 1 Jac. I. c. 9. Ale-house keepers selling in short measures are exposed to a penalty of not less than ten shillings, and not more than forty shillings.

ALE-SILVER, a rent, or tribute, yearly paid to the lord mayor of London, by those who sell ale within the city.

ALE-TASTER, is an officer appointed and sworn, in certain court-leets, to take heed that there be a due size, and goodness of bread, ale, and beer, sold within the jurisdiction of the leet.

ALE MEDICATED, in pharmacy, ale wherein medicinal herbs have been infused, or added during the fermentation.

ALEA, in antiquity, denotes in general all kinds of games of chance; but, in a more restricted sense, was used for a particular game played with dice and tables, not unlike our back-gammon, and wherein black and white stones were used instead of wooden men. The Greeks called these games *pettia* and *chivia*, and the Romans, *tabula*, *tessera*, *duodecim scripta*, &c. Some writers on Roman Antiquity observe, that, in games of hazard, two sorts of dice were used; the *tessera*, or cube, having its six sides marked from one to six; and the talus of an oblong form, of which the four long sides only were marked; one side having one point on it, the opposite six points, and the other two sides four and three. In playing, three tesserae, or four tali were used, which, after being shaken in the dice-box, called *fritillus*, were, to guard the better against fraud, thrown through another box, the *pyrgus* or *turricula*, in the form of a tower, placed on the middle of the board. The *fritillus* and the *pyrgus* have been considered, however, as the same box. The highest cast of the *tesserae* was three sixes, and of the *tali*, when all four came up different. It was named *Venus*, or *Venereus Jactus*. The Cornelian, Publician, and Titian laws were passed to prohibit all games of chance (which in them seem to be comprehended under the general title of *alea*), except in the month of December, when the *Saturnalia* were celebrated. But it is supposed, by some authors, that they were designed only to restrain the cupidity of professed gamblers, who were held in infamy; or these laws do not seem to have been generally regarded; and the Roman emperors countenanced dice-playing by their own example. All gaming was expressly forbidden in the army. *Cicero de Senect.* cap. 16; *de Divinat.* l. i. c. 13; *Suet. Vit. Aug.* cap. 17; *Dion. Cass.* l. lix. c. 22; *Mart. lib. xiv. ep. 14;* and *lib. v. ep. 85*; *Hor. l. iii. od. 24*; *Juv. Sat. xiv. v. 4.*

ALEA, in mythology, an epithet of Minerva. Also a town of Arcadia, on the east border, named after its founder *Aleus*, whose inhabitants were always members of the councils of Argolis. Both Bacchus and Minerva, surnamed *ALEA*, see above, had temples here; where the women, it is said, were scourged at the public festivals by command of the Delphic oracle. Augustus conveyed the ivory statue of the goddess from this place to Rome.

ALEANDE, (Jerome,) cardinal and archbishop of Brindisi, was born in 1480: and distinguished at the beginning of the reformation by his opposition to Luther. Being sent into Germany as the pope's nuncio in 1519, he declaimed for three hours against the reformed doctrine before the diet of Worms, but could not prevent Luther from being heard. He published several works, and died at Rome in 1541.

ALEANDER, (Jerome,) a learned divine of the seventeenth century, of the same family with the preceding, was born in Priuli. He was employed at Rome as secretary under cardinal Bandini, and discharged this office with great honour

for almost twenty years. He afterwards, at the particular wish of Urban VIII. became secretary to cardinal F. Barberini, whom he accompanied to France in the character of legate à latere, and in whose service he died in 1631. He was one of the first members of the academy of Humorists, see *ACADEMY*; and wrote, 1. *Psalmi Penitentiales, Versibus Elegiacis expressi*, 4to. 1593.—2. *Caui, Veteris Jurisconsulti, Institutionum Fragmenta cum Commentario*, 4to. 1600. Venet.—3. *Explicatio Antiquæ Tabulae Marmoreæ*, &c. 4to. Venet. 1627.—4. *Carmina Varia*.—5. *Le Lagrime di Penitenza, ad Imitatione di sette Salmi Penitenziali*, 8vo. Rom. 1623.—6. *Difesa dell'Adone, Poema del Cavaliere Marino*, pt. i. 12mo. Venet. 1629; pt. ii. 1630; besides other smaller works mentioned by Mazzuchelli.

ALEATORIUM, in Roman antiquity, was the place where they played at alea. The aleatorium was near the sphæristerium; that the sportsmen, when tired with the *pila*, or more robust exercises, might refresh themselves in the aleatorium.

ALEC, in ichthyology, a name given by Gaza, in his commentaries on Aristotle, to the fish called *mainis*, and by Ovid *menerela*. It is of the *sparus* kind.

ALECTO, in mythology, from *α priv.* and *ληγω*, to rest, one of the three furies; the daughter of Acheron and Night, or, as others have it, of Pluto and Proserpine. Virgil, *AEn. lib. vii. v. 32*, introduces Alecto exciting the flames of war, at the instigation of the implacable Juno, between the Latins and the Trojans. He describes her as having her hair and her dark wings covered with wreathing snakes, whose poison she infuses into her victims, till she infects them with ungovernable rage. So malignant was this divinity, that she was the abhorrence of Pluto, her father, and of her sister furies. From Cocytus, a river of hell, she is called *Cocytia Virgo*. Claud. in *Ruf. l. i. v. 25*. speaks of her as *atrox, black,*

Invidiae quondam stimulis incanduit atrex
Alecto, placidas late cum cerneret urbes.

ALECTORIA, from *ἀλεκτωρ*, a cock, a stone said to be formed in the gall-bladders of old cocks, to which the ancients ascribed many fabulous virtues. It was called *alectorius lapis* and *alectorolithos*. Modern naturalists hold the *alectorius lapis* to be swallowed, and not generated in the stomach or gizzard of cocks and capons.

ALECTORICARDITES, from *ἀλεκτωρ*, an *καρδία*, the heart, in natural history, a name given by Plot, to a figured stone resembling a pullet's heart, with the fat near the basis of it, and the coronary vessels descending from it.

ALECTOROLITHOS. See *ALECTORIA*.

ALECTOROMANTIA. See *PENDICULARIS*.

ALECTOROMANTIA, in antiquity, a kind of divination performed by means of a cock; and thus effected: a circle being described on the ground, and divided into twenty-four equal portions, in each of these spaces was written one of the letters of the alphabet, and on each of the letters was laid a grain of wheat; after which a cock being turned loose in the circle, particular notice was taken of the grains which he picked

up, because the letters under them, being formed into a word, made the answer desired. It was thus, according to Zonaras, that Libanius and Jamblicus sought who should succeed the emperor Valens; and the cock, eating the grains answering to the spaces ΘΕΟΔΑ, several whose names began with these letters, as Theodosius, Theodistes, Theodolus, &c. were put to death; which did not hinder, but promote, the succession of Theodosius. This story, however, has been called in question, from the silence of Marcellinus, Socrates, and other historians of the time. Another species of augury was taken from the crowing of the cock, wherein regard was had to the time of day, whether before noon or after; to which some added the consideration of the sign the sun was in, and the motion of the moon.

ALECTRA, in botany, a genus of the didynamia angio-spermia class and order; its characters are: cal. a one-leaved, two-lipped, perianthium, upper lip two-cleft, lower three-cleft; the clefts ovate, obtuse, shorter than the tube; cor. one-petalled, tubular, the tube gradually widened; the border expanding, five-parted; the parts broad, lanceolate, obtuse: STAM. four filaments, inserted into the tube, filiform, bearded, of the length of the tube, two of them a little shorter; anthera: twin: PIST. a germ ovate; style filiform, of the length of the filaments; stigma incurved, a little thicker than the style, and of the same length, striated on both sides: PERICARP. a capsule, ovate, obtuse, twin, smooth, two-celled, and two-valved; the seeds solitary and ovate. There is one species, viz. A. Capensis, a native of the Cape of Good Hope, growing in grassy places near rivers, and flowering in November and December, and growing black in drying. *Martyn.*

ALECTRUONURUS. See FESTUCA.

ALECTRYOMANCY, from *ἀλεκτωρ*, a cock, and *μάχη*, a fight, cock-fighting.

ALECTRYON, a youth whom Mars, in an amour with Venus, stationed at the door to watch the approach of the sun. He however fell asleep, and Apollo came and discovered the lovers, who were exposed in each other's arms before all the gods. The incensed Mars changed Aletryon into a cock, which, mindful of his neglect, was said ever after to announce early the approach of the sun.

A-LEE, in the sea-language, a term only used when the wind, crossing or flanking the line of a ship's course, presses upon the masts and sails so as to make her incline to one side, which is called the lee-side: hence, when the helm is moved over to this side, it is said to be a-lee, or hard a-lee.

ALEGAMBE, (Philip,) a celebrated Jesuit, born at Brussels, 1592, distinguished himself by publishing, 1. *Bibliotheca Scriptorum Societatis Jesu*, folio, Antw. 1643. 2. *Vita P. Joannis Cardin Lusitani ex Societate Jesu*, 12mo. Rom, 1649. 3. *Heroes et Victimæ Charitatis Societatis Jesu*, quarto, Rom. 1658. 4. *Mortes Illustris et Gesta eorum de Societate Jesu, qui in Odium Fidei ab Hæreticis vel alii occisi sunt*, fol. Rom. 1657. He died at Rome in 1652.

ALEGER, or *Ale, aigre*, Fr. sour. Sour ALEGAR. *Ale*, a kind of acid liquor made with ale or malt. Power has given a description of the eels in aleger.

ALF'GER. *Allegro*, Ital. Gay, cheerful.—Obsolete.

Coffee, the root and leaf-beetle, and leaf-tobacco, of which the Turks are great takers, do all condense the spirits, and make them strong and aleger.

Bacon's Nat. Hist.

ALEGGE', } A. S. Alecgan, Leegan, to
ALEGE'ANCE, } lay, to lay down—whence, or
ALEGE'MENT. } from a similar origin, the old
Fr. *alleger, aleger*.

The modern word is allay. To lay, to put down, to ease, sooth, or alleviate.

po he was ýcrouned kyng at Westmynstre ý wys,
He byþet God and pat fole an byheste, pat was pys
To alege alle luper lawes, pat ýholde were býnore,
And betere mak pan were supp he was ýbore.

R. Gloucester, p. 422.

It would have brought my life againe
For certes euinely, I dare well saine
The sight only and the saour
Alegerd much of my langour.

Chaucer. The Romaunt of the Rose

His feeling wordes her feble sence much pleased,
And softly sunck into her molten hart;
Hart, that is inly hurt, is greatly eased
With hope of thing that may allegre his smart.

Spenser's Faerie Queene, b. iii. c. ii.

ALEGRE, a town of France, in Auvergne, intendancy of Riom, with the title of a marquisate; now in the department of the Upper Loire, arrondissement of Le Puy. The number of houses is about 200, that of inhabitants 900. Eighteen leagues south-south-east of Clermont Ferrand.

ALEGRETTE, a fortified town of Portugal, in the province of Alentejo, on the Spanish frontier, seven miles and a half south-east of Portalegre, on the river Caja, a branch of the Guardiana.

ALEIPHA, from *ἀλειφω*, I anoint, in the materia medica of the ancients, a word used for all fatty bodies whatever; as the oils of vegetables, the fat of animals, any sort of medicated oil impregnated with aromatic vegetables, &c. Its general meaning was such compositions as were intended to anoint the body, or fats impregnated with the lighter parts of plants, and not clogged with an addition of powders, wax, or any thing which might have given them the consistence of ointments. The ancient physicians were very fond of these compositions, which they applied both to a diseased part, and to the whole body, after they had made the patient use the warm bath to relax and open the pores.

ALEIUS CAMPUS, in ancient geography, a plain in Cilicia, on this side the river Pyramus, near the mountain Chimera, famous for Belleroophon's wandering and perishing there, after being thrown off Pegasus; from which it obtained the appellation.

ALEMANNI, or ALEMANS, in ancient history, a body of Suevi, who appeared on the banks of the Mein, and in the neighbourhood of the Roman provinces, in quest either of food or plunder, early in the third century of the

Christian era. Asinius Quadratus, an original Roman historian, cited by Agathias, lib. i. c. 5, informs us, that their hasty army, which coalesced into a great and permanent nation, was composed of many different tribes, and on this account assumed the name of Allemanni, or All-men, i. e. men of all nations, and perhaps to denote their common bravery. They were chiefly Suevi, however, who were joined by several other German nations and some Gauls. Aurelius Victor, St. Jerome, and other writers, place them between the Danube, the Upper Rhine, and the Mein, in the present duchy of Würtemberg. They were numerous and warlike, and were chiefly celebrated for fighting with great dexterity and bravery on horseback. Their abhorrence of slavery was so great, that those taken prisoners chose rather to die than to endure captivity; and when they were actually sold, they not only destroyed themselves, but some of them dispatched also their children. The government of their tribes was monarchical; and the objects of their worship were the same with those of the other German nations. Caracalla, in consequence of a victory which he gained over them in the year 214, was distinguished by the surname of Alemannicus. In the thirteenth year of Alexander Severus, the Allemanni, accompanied with other German nations, passed the Rhine, took possession of the forts on the banks of that river, and ravaged Gaul. The emperor returning from Persia, hastened to the banks of the Rhine, and as the Allemanni had re-passed the river upon the news of his approach, he ordered a bridge to be thrown over, proposing to attack them in their own country: but being assassinated at this juncture by his soldiery, this business devolved upon his successor. Accordingly Maximinus pursued them with great slaughter, took many of them prisoners, and great spoil of corn and cattle; in commemoration of which, the senate conferred upon him and his son the title of Germanicus. In the year 256, the fourth of Valerian's reign, the Allemanni made an unexpected irruption into Gaul, and laid waste the country; whilst those who dwelt on the banks of the Danube, penetrated the Rhætian Alps into the plains of Lombardy, advanced as far as Ravenna, and displayed their victorious banners almost in sight of Rome. A large army being suddenly convened, the Allemanni were intimidated, and retired into Germany. On another occasion 300,000 of this warlike people are said to have been vanquished in a battle near Milan, by Gallienus, at the head of only 10,000 Romans; after which Gallienus seems to have formed an alliance with the Allemanni, and to have protected Italy from their fury, by marrying Pipa, the daughter of a king of the Marcomanni. A party of them was defeated by Cladius in 268, and compelled to save themselves by a precipitate flight into their own country. As soon, however, as they heard of the death of Cladius, they prepared for again invading Italy; 40,000 horse appeared in the field, and the number of the infantry doubled that of the cavalry. Their first objects were a few cities on the Rhætian frontier; but as they proceeded they

enlarged their views, and traced a line of devastation from the Danube to the Po.

Aurelian, A.D. 270, having collected an active body of troops, marched with silence and celerity along the skirts of the Hercynian forest; and when the Allemanni, laden with the spoils of Italy, arrived at the Danube, the Roman army, which lay concealed, intercepted their return. The dismayed barbarians, enclosed by the Roman legions, and reduced to a condition abject and distressed, now sued for peace. Their ambassadors were received by Aurelian with every appendage of dignity; and when they were ordered to rise and allowed to speak, they attempted to extenuate their conduct, and demanded a large subsidy, as the price of the alliance which they offered to the Romans. The emperor's reply was stern and imperious. He treated their offer with contempt, and their demand with indignation; and dismissed them with the choice only of submitting to his unconditional mercy, or awaiting the utmost severity of his resentment. Aurelian, being suddenly called away into Pannonia, committed the destruction of the Allemanni, either by sword or by famine, to his lieutenants. But the barbarians once more made their escape, and returned towards the mountains of Italy. As soon as the emperor heard of this, and that they were ravaging the territory of Milan, he hastened to march to its relief. The Allemanni, in the mean while, had spread themselves from the Alps to the Apennines; and, by a desultory war, the force of the enemy remained unsubdued. Three considerable battles are mentioned, in which the principal force of both armies was obstinately engaged. In the first battle, fought near Placentia, the Romans received so severe a blow, that the immediate dissolution of the empire was apprehended. But the firmness of the emperor restored in some degree the honour of his arms. The second battle was fought near Fano, in Umbria; and here the Allemanni were totally and irretrievably defeated. The flying remnant of their host was exterminated in a third and last battle near Pavia; and Italy was rescued from the inroads of these barbarians. During the alarm which preceded the decisive battle of Fano, the Sibylline books were consulted, A.D. 271; and the ceremonies which were enjoined were punctiliously observed. 'These superstitious arts,' says Mr. Gibbon, 'however peurile in themselves, were subservient to the success of the war; and if, in the decisive battle of Fano, the Allemanni fancied they saw an army of spectres combatting on the side of Aurelian, he received a real and effectual aid from this imaginary reinforcement.'

They are still to be traced as the assailants of Rome, for nearly two centuries onward. The emperor Probus, A.D. 277, delivered Gaul from the invasion of these tribes, and recovered seventy flourishing cities, which had been oppressed by them. He passed the Rhine, compelled nine of the most considerable princes of Germany to repair to his camp, to fall prostrate at his feet, and to accept such conditions as he thought proper to dictate: and, in order to raise a bulwark

against their future inroads, he constructed a stone wall of considerable height, and strengthened it by towers at convenient distances. It stretched from the neighbourhood of Newstadt and Ratisbon, on the Danube, across hills, valleys, rivers, and morasses, as far as Wimpfen, on the Neckar, and at length terminated on the banks of the Rhine, after a winding course of near 200 miles. Within a few years after the death of Probus, this wall was overthrown by the Alemanni. In 287, they made another incursion into Gaul, but were defeated by Maximian, who, in the following year, laid their country waste wherever he came, with fire and sword. Dioclesian also, at the same time, entered Germany through Rhaetia; and is said to have extended the confines of the empire to the source of the Danube. In the year 291 the Burgundians seized on part of the country belonging to the Alemanni; and in 301 Constantius Chlorus, the father of Constantine, gained a signal victory over them, on which occasion the Alemanni are said to have lost 60,000 men. Notwithstanding this loss, they did not long remain quiet; for in 310, they crossed the Rhine and ravaged the neighbouring provinces: but the emperor himself marching against them, defeated them in a battle, and obliged them to quit their booty and repass the Rhine. Some say he was called Maximus on account of this victory. In the 18th year of Constantius's reign, the Alemanni again attempted to make an incursion into Italy; and having advanced as far as the lake of Constance, that prince marched against them, and put them to flight. In the course of the same year, another body breaking into Gaul, with the Franks and Saxons, took and plundered above 40 towns on the banks of the Rhine, among which was the city of Cologne, which they almost entirely ruined. They were at length driven out of Gaul by Julian; but assembling near Strasburg, A.D. 357, a battle ensued; and after victory had remained for some time in suspense, the Alemanni were defeated, and driven completely out of Gaul. Julian now granted them a truce for ten months. When the truce expired, he passed the Rhine on a bridge of boats, entered their country, and compelled them to sue for peace. Upon his death they again ravaged Gaul; defeated the Romans in a pitched battle, but were afterwards defeated by Jovinus in three battles, A.D. 366. In the close of the following year they again rally, and pass the Rhine; but Valentinian gains a signal victory over them: invades their country; and in 374 concludes a peace with their king Macrianus. In 387 they are again in arms, and waste the neighbouring provinces, but are defeated with great slaughter by Gratian; in 388 submit to Maximus, who usurped the empire in Gaul, and agree to pay him a yearly tribute.

In the reign of Honorius a colony of the Alemanni was allowed to settle in that part of the present Switzerland, which is separated by mount Jura from the Franche Comté, and by the lake of Geneva and the Rhine from the present Savoy and province of Vienne. In 477 Audouerius, king of the Saxons, and Childeric,

king of the Franks, marched against those who had settled among the Alps, and put many of them to death. Upon the destruction of the western empire, the Alemanni subdued that part of Gaul which is now known by the name of Alsace, where they settled. These were joined by their countrymen in Germany, and those who dwelt between mount Jura and the lake of Geneva; and in 496 entered Germania Secunda, and wasted the country; but they were overcome by Clovis, king of the Salian Franks, and dispersed. Those who settled in Alsace, and near the lake of Geneva, acknowledged him for their king. Others took refuge in Rhaetia and Noricum, where they were allowed by Theodoric, king of Italy, to reside. Many of them were transplanted by the same prince into Italy, and the rest were permitted to settle between the Alps and the Danube. From this time the Alemanni had no king of their own; but continued, as they were dispersed in several countries, subject partly to the Ostrogoths, who were masters of Italy, and partly to the Franks, who had dominion in Gaul. When the Ostrogoths ceded their territories out of Italy to the children of Clovis, the Alemanni, those excepted whom Theodoric had transplanted into that country, submitted to the Franks. *Gibbon's History, &c.* Vol. i. p. 417, &c. Vol. ii. p. 21, &c. *Un. Hist.* vol. xvii. p. 288—299.

ALEMANNIA, or ALEMANIA, in ancient geography, a name given to Germany, which was not known before the time of the Antonines, and then applied only to part of it. The appellation is derived from the Alemanni.

ALEMBDAR, or ALEMDAR, an officer in the court of the grand seignior, who bears the green standard of Mahomet, when the sultan appears in public upon so solemn occasion.

ALEMBERT, (John le Rond d'), an eminent French philosopher, born at Paris in 1717. He derived the name of John le Rond, from that of the church, near which, after his birth, he was exposed as a foundling. His father, Destouches Canon, informed of this circumstance, and listening to the voice of nature and duty, took measures for the proper education of his child, and for his future subsistence in a state of ease and independence. He received his first education among the Jansenists, where he gave early marks of capacity and genius. In the first year of his philosophical studies, he composed a Commentary on the Epistle to the Romans. The Jansenists considered this production as an omen that portended to the party of Port Royal, a restoration of some part of their ancient splendour; and hoped to find, one day, in M. d'Alembert, a second Pascal. They now, therefore, engaged their rising pupil in theology and mathematics; but soon perceived, that his enthusiastic attachment to science, was likely to disappoint the hopes they had formed with respect to his future destination. On his leaving college, he found himself alone and unconnected in the world: and sought an asylum in the house of his nurse, the wife of a glazier, comforting himself with the hope, that his fortune, though not ample, would better the condition and subsistence of a family,

which was the only one he could consider as his own. Here he lived, during the space of 30 years, with the greatest simplicity, discovering the augmentation of his means only by increasing displays of his beneficence. His growing reputation and celebrity, were entirely unknown to these honest people, and their plain and uncouth manners, were the daily subject of his good-natured pleasantries, and philosophical observation. His nurse perceived his ardent activity; and heard him mentioned as the writer of many books; but never supposed him the great man he was, and beheld his conduct with regret and compassion. ‘ You will never,’ said she to him one day, ‘ be any thing but a philosopher—and what is a philosopher?—A fool, who toils and plagues himself during his life, that people may talk of him when he is no more.’ M. d’Alembert’s fortune not much exceeding the demands of necessity, his friends advised him to think of a profession that might enable him to augment it. He accordingly turned his views to the law, and took his degrees, but soon abandoned this for the study of medicine. His passion for mathematical studies, however, was always drawing him back to his former pursuits, and after many ineffectual efforts to overcome it, he renounced all views of a lucrative profession, and gave himself over entirely to the pursuit of science and to poverty. In 1741, he was admitted member of the Academy of Sciences; having attracted universal attention and admiration, by correcting the errors of a celebrated work, the *Analyse démontrée* of F. Beinau, which was deemed classical in France, as a treatise on geometry. He, after this, set himself to examine, with great assiduity, the motion of a body which passes from one fluid into another more dense, in a direction not perpendicular to the surface separating the two fluids. Every one knows the phenomenon which happens in this case; but M. d’Alembert was the first who explained it in a satisfactory and philosophical manner. Two years after his election to a place in the academy, he published his Treatise on Dynamics, and established the principle of the equality, at each instant, between the changes that the motion of a body has undergone, and the powers which have been employed to produce them. So early as 1744, M. d’Alembert had applied this principle to the theory of the equilibrium, and the motion of fluids; and all the problems before solved by geometers, became, in some measure, its corollaries. The discovery of this new principle, was followed by that of a new calculus, the first trials of which were published in a Discourse on the general theory of the Winds; to which the prize medal was adjudged, by the academy of Berlin, in 1746; and which was a brilliant addition to the fame of d’Alembert. This new calculus of partial differences, he applied to the problem of vibrating chords, whose solution, as well as the theory of the oscillations of the air and the propagation of sound, had been given but incompletely by the geometers who preceded him. In 1749, he applied his principle to the motion of any body of a given figure; and solved the problem of the procession of the equinoxes; determined its quantity; and ex-

plained the nutation of the terrestrial axis discovered by Dr. Bradley. In 1752, he published a treatise on the Resistance of Fluids, to which he gave the modest title of an *Essay*; but which contains a multitude of original ideas, and new observations. He also published, in the Memoirs of the Academy of Berlin, Researches concerning the integral calculus, which is indebted to him for the progress it has made in the present century.

While the studies of M. d’Alembert were confined to geometry, he was little known or celebrated in his native country. His connections were limited to a small society of select friends; and he had made no acquaintance with men in power. Satisfied with an income which furnished him with the necessities of life, he did not aspire after opulence or honours; nor had they been hitherto bestowed upon him, as it is easier to confer them on the forward, than to look out for the deserving. But his cheerful conversation, and a singular mixture of delicate wit with simplicity of manners, rendered him a pleasant companion, and he was now much sought after in the fashionable circles. His reputation, at length, reached the throne. He received a pension from the French government of 1200 livres, which he owed to the friendship of Count d’Argenson. This accession to his pecuniary resources, is said, however, to have but little increased his happiness. His eulogist, the celebrated Condorcet, ascribes to envy, detraction, and other ungenerous motives, all the opposition and censure that M. d’Alembert met with on account of the famous Encyclopedical Dictionary of Arts and Sciences. None can fairly refuse the tribute of applause to the eminent genius, judgment, and literary taste, displayed by our author in his contributions to this great work. The preliminary discourse which he affixed to it, on the rise, progress, and connection of all the branches of human knowledge, is perhaps one of the most capital productions of which the philosophy of the present age can boast. Nor will it be disputed, that the master builders of this new and stupendous temple of science, for the worship of Nature, had also really in view the advancement of human knowledge, and the improvement of the arts and sciences. This, no candid philosopher will call in question. But that in the inner court of this temple, there was a confederacy formed against all who looked higher than Nature, for the object of their veneration and confidence, is a fact too palpable, nay, too boldly avowed, to stand in need of any proof. Some time after, d’Alembert published his Philosophical, Historical, and Philological Miscellanies; and his memoirs of Christina, queen of Sweden; in which last work he proved that he was well acquainted with the natural rights of mankind, and was bold enough to assert them. His *Essay on the Intercourse of Men of Letters with Persons high in Rank and Office*, wounded the former to the quick, as it exposed to the eyes of the public the ignominy of those servile chains, which they feared to shake off, or were proud to wear. This work was dedicated to the king of Prussia, who was at this time terminating a glorious campaign by

an honourable peace, in the three following Latin verses :

*Hec ego de ventis, dum ventorum ocyor alis
Palantes agit Austriacos Fredericus, et orbi,
Insignis lauro, ramum prætendit olivæ.*

Swifter than wind, while of the winds I write,
The foes of conquering Frederic speed their flight;
While laurel o'er the hero's temple bends,
To the tir'd world the olive branch he sends.'

M. d'Alembert also gave decided proofs of his classical taste, in his translations of some select pieces of Tacitus. About the same time he enriched the Encyclopedia with a multitude of excellent mathematical articles, and composed his Researches on several important Points of the System of the World, in which he carried to a higher degree of perfection, the solution of the problem of the perturbation of the planets.

M. d'Alembert, in 1759, published his Elements of Philosophy; a work remarkable for its precision and perspicuity; but containing many questionable tenets, in metaphysics and moral science. The resentment that was kindled, and the disputes that followed upon the publication of the article Geneva, inserted in the Encyclopedia, are well known. M. d'Alembert did not leave the field of controversy with triumph. His attacks upon the religious orders and the priesthood, if in many respects just, were often indiscriminating and violent. Voltaire was an auxiliary in the contest: but as, in the point of candour, he had no reputation to lose, and as he weakened the blows of his enemies, only by throwing both them and the spectators into laughter, the issue of the war gave him little uneasiness. It fell more heavily on d'Alembert; and exposed him, even at home, to much contradiction and opposition. It was on this occasion that the king of Prussia offered him an honourable asylum at Berlin, and the presidency of the academy; and was not offended at his refusal, but cultivated an intimate friendship with him during the rest of his life. He had, some time before this, refused a proposal made by the empress of Russia to instruct him with the education of the Grand Duke: —a proposal accompanied with all the flattering offers that could tempt a man ambitious of titles, or desirous of making a fortune; but tranquillity and study, not ambition or avarice, were the objects of our philosopher's affection. In 1765, he published his Dissertation on the Destruction of the Jesuits. This piece drew upon him a host of adversaries, who confirmed the credit of his work, by their manner of attacking it. Besides the works already mentioned, he published Opuscules, 9 vols.; in which he has solved a multitude of problems relative to astronomy, mathematics, and natural philosophy; and Elements of Music; rendering at length, the system of Reaumeur intelligible; but he did not think the mathematical theory of the sonorous body sufficient to account for the rules of that art. He was always fond of music; which he felt to be connected with the most subtle researches of mechanics; while, on the other hand, its power over the soul exhibited to him phenomena, perhaps still more inexplicable. In 1772, he was chosen secretary to the French academy, and soon after formed the design of writing the lives of all the

deceased academicians from 1700 to 1772; which he executed in the space of three years, composing seventy eulogies. M. d'Alembert died in 1783. There were many amiable lines of candour, modesty, disinterestedness, and beneficence, in his moral character; which are described, with diffusive detail, in his eulogium, by M. Condorcet.

Many young persons, who discovered talents for science and learning, found in him a patron and a guide. To worthy men, in adversity or under persecution, he was a firm and courageous friend: and to those who had shewn him kindness, he never ceased to be grateful. Two of his works were dedicated to ministers in disgrace, the Count d'Argenson, to whom he owed his pension, and the Marquis d'Argenson, who had given him many proofs of respect and esteem. When in early life, Mad. de Tencin, informed of his singular talents, came to him, and fondly caressing him, discovered to him the secret of his birth: 'What do you tell me?' he cried out: 'Ah! you are but a step-mother; it is the glazier's wife who is my mother;' and through life he retained for his nurse the affectionate sensibility of a grateful son.

Much of pernicious influence on the morals and politics of France, has been attributed to the writings of d'Alembert: and to him and his friends has been assigned the odium of bringing on the disasters of the Revolution. We are not indifferent to the dangerous spirit of infidelity that breathes throughout his works; nor to the unphilosophical manner, so common in modern times, of insinuating sceptical principles in works of science. But that France needed a revolution, both in church and state, it is too late to deny; and if she effected it without the moderation of our own happy change in 1688, the immediate actors in the scene are perhaps more justly blameable, than an individual writer, so remotely connected with it as our philosopher.

ALEMBICS, from the Arabic particle *al*, and *αὐβίξ*, Gr. an earthen vessel, were made of glass or of copper, and used for distillation. The bottom which contained the subject for distillation, was called, from its shape, the *cucurbit*; the upper part, which received and condensed the steam, was called the *head*, the beak being fitted into the neck of a receiver. Retorts, and the common worm still, are now more generally employed.

Dioscorides and Pliny mention the *αὐβίξ*, (*ambix*) which is described by the latter of these writers, as a hemispherical iron cover, luted upon the earthen pots in which mercury was procured by the distillation of cinnabar: it is probable however, that the ambix was in the time of Pliny a mere plain still, without any beak or gutter, since he mentions the mercury being wiped off in small drops from the inside of the vessel, the necessity of which would be superseded by the invention of a beak. When the alchemists adopted the alembic, their object being to separate, as much as possible, the most volatile products from those that are less so, they imagined that the greater distance which the vapour had to pass through, in its passage from the boiler to the condenser, the more perfectly would the spirit or quintessence be dephlegmated; for this pur-

pose the body of the alembic was made of a globular form, terminating above in a long narrow neck, to the end of which was luted the capital; sometimes for the purpose of more effectually keeping down the impure particles, the neck was bent in a zig-zag or spiral direction. The characteristic difference between an alembic and a still seems to be in the construction of the head or capital, which in the alembic is contrived not merely to collect, but to condense the vapour; whereas, the corresponding part of a still serves merely to collect the vapour, which is transmitted in an elastic state through the beak, and condensed in the worm. In the figure already referred to, the distance between the body and the capital is so great, that much of the heat must be given off from the vapour before it arrives in this part; the mere refrigerating power, therefore, of the atmosphere is amply sufficient to condense the vapour into drops on the inner surface of the capital, which, trickling down into the channel or gutter at the bottom, are delivered by the beak into any vessel placed to receive them. The length and narrowness, and convolution of the neck, were, however, found to condense so much of the vapour before it reached the capital, as to render all processes, in which it was employed, insufferably tedious; besides requiring so high a heat as to alter and injure the products very considerably; the neck was therefore shortened and made wider, and as, in consequence of this, the vapour came into the capital more heated than before, it was necessary to substitute a more powerful refrigerating cause to the casual and varying action of the external air; with this intention, the capital of the metallic alembics was inserted into a vessel of water, called a refrigeratory, and thus the alembic, as far as concerned the number and general disposition of its parts, was completed.

The glass and earthen-ware alembics soon received all the perfection of form which their materials would allow: the body, instead of being a globe with a long neck, was altered into a cucurbit; and the capital assumed a more conical shape, the two parts of the apparatus were also fitted closely into each other, by grinding with emery. The irregular expansion and contraction of glass by heat, rendered the use of a refrigeratory impossible, so that when distilling briskly, it is necessary to cover the capital with cloth, soaked in cold water and frequently renewed: thus requiring a constant attention, besides running the risk of cracking the cucurbit, by a drop of cold water falling upon it from the head. On this account the glass alembic is but little employed, although capable, when skilfully managed, of distilling a much larger quantity in a given time, than a retort of equal capacity.

The metallic alembics being formed of more manageable substances, and being appropriated to large processes, in which economy of time and fuel was of great importance, invited and obtained a number of valuable improvements: The most considerable of these are due to M. Beaumé. The French brandies are generally prepared in alembics, whereas all British spirits

are manufactured in stills; the advantage of the alembic is that less fuel is required, and the spirit is but little exposed to the risk of becoming empyreumatic. Its disadvantage consists in being less expeditious, and in requiring greater accuracy in the temperature of the refrigeratory; if too cold, the vapour is in part condensed before it touches the inside of the capital, and falls back into the boiler; if too hot, a portion of vapour, escapes into the air; a greater proportion also of water is required for the condensation of a given quantity of vapour, than where a worm and still is made use of. *Encyclop. Method. Art. Alembic.*—*Beaumé Elemens de Pharmacie, &c.*

ALEMETHI, or ALMON, a city of Judea, in the tribe of Benjamin, situated near Anathoth.

ALEMBROTH, from a Chaldean word signifying the key of art, in the writings of the alchemists, a word used for a sort of fixed alkaline salt, which had the power of the famous alcahest, in dissolving bodies, opening the pores of most or all known substances, and thence, as well as by destroying sulphurs, promoting the separation of metals from their ores. It is also used for a compound of sal ammoniac and corrosive sublimate. Some use the term alembroth desiccatum, for salt of tartar. ‘Corrosive muriate of mercury,’ says Dr. Ure, ‘is rendered much more soluble in water by the addition of muriate of ammonia. From this solution crystals are separated by cooling, called sal-alembroth by the earlier chemists, consisting of ammonia, muriatic acid, and mercury.’

ALEMPARVE, or ALLAMPARVA, a fortress of Hindostan, on the sea-coast of the Carnatic, which was transferred, by the native powers, to the French in 1750, and taken from them by the British in 1760. Distant sixty-seven miles south-west of Madras. Long. $80^{\circ} 7'$. E. Lat. $12^{\circ} 10'$. N.

ALENCON, or ALENZON, a large and populous town of France, the capital of the department of Orne, seated on the Sarte, in an open fertile country, abounding in corn and fruits. It is situated twenty miles north of Mons, sixty-three south by west of Rouen, and eighty-seven south-west of Paris. It was formerly surrounded with good walls, and flanked with towers; and the castle was a place of great consequence, having sustained several long sieges. A square tower 150 feet high still remains. Near it there are quarries of stone of the Bristol kind, &c Lon. $0^{\circ} 10'$. E. Lat. $48^{\circ} 25'$. N. Inhabitants 13,000. Alençon has a linen trade of some extent, but is particularly famous for its point-lace, a manufactory of which was established under M. Colbert's administration in 1665, by letters patent; and a grant from government to the proprietors of 26,000 livres as a capital. Here are also glass-houses, smelting-houses, and tanneries, in a flourishing state.

ALENIO, (Julius) a Jesuit, born at Brescia, in the republic of Venice. He travelled into the eastern countries; and arrived at Macao in 1610, where he taught the mathematics. From thence he went to the empire of China, where he continued to propagate the Christian religion for thirty-six years. He was the first who planted the faith in the province of Xanfi, and built

several churches in that of Fokien. He died in 1649, leaving behind him several works in the Chinese language.

ALENON, a word used by old medical writers, for the oil of sweet almonds.

ALENTEJO, one of the largest provinces of Portugal, seated between the Tagus and the Guadiana, and watered by both. It is bounded on the north by Estremadura and Beira; on the east by Spain; on the south by Algarve; and on the west by the sea; extending from north to south about forty miles, and from east to west between thirty and thirty-four. The soil is very

fertile. It takes its name from its situation, lying, with regard to the other provinces, on the farther side of the Tajo, or Tajus. Its superficial extent is 883 French leagues, and the population, in 1800, was 380,480. Evora is the capital. Alentejo contains four cities, 105 towns, and 358 parishes. It is divided into the eight jurisdictions of Evora, Beja, Elvas, Portalegre, Ourique, Villa Viciosa, Crato, and Aviz.

ALENZON. See ALENCON.

ALEORE, *ἀλεωρη*, a word used by the old medical writers, for the intermission of ease from the raging pains of any violent acute distemper.

A L E P P O.

ALEPPO, OLD, the Kinnasreen of the Arabians, an ancient town of Syria, supposed to have been Calchis, the capital of the district Chalcidone. It gives its Arabian name to the northern part of Syria, and is fifteen miles south of the modern Aleppo. The ruins, (for the whole place is scarcely any thing beside,) are surrounded by the foundations of walls, about a mile in compass, ten feet thick, and fortified by equidistant square towers. On the top of a high hill, west of the city, on which the castle stood, surrounded by a double wall, are three or four very fine large cisterns excavated from the rock. The district around the city was reckoned one of the most fruitful provinces of Syria, and was seized by Ptolemy, the son of Mennæus, during the troubles of Syria, and by him made a separate kingdom. Ptolemy himself is styled by Josephus and Igesippus, prince of Chalchis, and his son Lysanias is honoured both by Josephus and Dio with the title of king. The place is frequently mentioned by authors of the middle ages, or even later. It capitulated to the Saracens in the year 630.

ALEPPO, BASHALICK or PACHALIC of, one of the five pachalics of Syria, was a province extending eastward from the bay of Scanderoon to the banks of the Euphrates, and from forty miles north of the city, extending about fifty miles to the south-east. But it is not now nearly so extensive. Khillis, formerly dependent on Aleppo, is erected into a separate district on account of the frequent depredations of the Kurdeens, who inhabit the neighbouring mountains; and since the year 1752, an alteration has taken place with respect to Bylan, which, together with Caramoot, Scanderoon, Byas, and the adjacent mountains, has been also placed under a distinct government. At present the pachalic on the north is bounded by the village of Bailik, situated in the road to Aintab, eastward by the Desert, Bab at the distance of ten hours east-north-east, and Haglah, about the same distance to the south-south-east, being among the last inhabited villages: on the south it is bounded by the Great Desert, between the skirts of which and the west, or west-north-west, are situated the most fertile and populous parts of the forest. Sirmeen is the last town southward; and Antioch, with its dependencies, may be reckoned the western boundary, which, till a

late period, reached to the sea: Scanderoon and Byas being then the two frontier maritime towns. About one half of the villages formerly on the borders of the province, are said to be totally deserted. Many of the inhabitants of this mountainous tract acknowledge scarcely any authority but that of their own chieftains; and the champaign, in many places, is either desert, or only occupied transiently by the wandering tribes of Turkmans, Begdelees, and Rushwans, from the north, or by the Bedowens and Chin-gana; who, though they pay an annual tribute, can in other respects, scarcely be considered subjects of the province. The oppression of the agas, the destructive marches of the grandees through the province, and the roving of the ruffian troops of Levands out of pay, oblige the peasant tenants to remove; so that vast tracks of the beautiful plains in the bashalick are shamefully overrun with thistles, whilst the mountainous parts, better secured from oppression, are finely cultivated, full of people, and present on every side thriving hamlets.

Such is the account given of this pachalic by Dr. Russel. Volney describes it, as extending from the Euphrates to the Mediterranean, between two lines, one drawn from Scanderoon to Beer, along the mountains, the other from Beleo to the sea by Mare and the bridge of Shogar, and as consisting of two plains, that of Antioch to the west, and that of Aleppo to the east; the north and sea coast being occupied by lofty mountains, known to the ancients by the names of Amanus and Rhosus. The soil of this pachalic is generally fat and loamy; the greatest part of the land lies waste, and the traces of cultivation are scarcely discernible in the environs of the town and villages.

The traveller sees nothing in this and other pachalics of Syria, but houses in ruins, cisterns rendered useless, and fields abandoned. Its principal produce consists in wheat, barley, and cotton, which are found in the flat country: in the mountains, the vine, mulberry, olive, and fig-trees are cultivated. The sides of the hills, towards the sea-coast, are appropriated to tobacco, and the territory of Aleppo to pistachios. The pasture is abandoned to the wandering Turkmans and Curds. See ALEPPO. Russel's Hist. vol. i. p. 314. 339. Volney's Travels vol. ii. p. 130, &c.

ALEPPO, the capital of the above pachalic,

is situated on eight small hills, and is watered by the river Kowick, which in winter sometimes swells into a formidable stream, overflowing its bridges and the neighbouring gardens, wherewith the banks are covered. The wall, supposed to have been built by the Mameluke princes, is flanked by frequent towers, but the fosse is partly filled up with rubbish, or occupied by kitchen gardens, and the city being commanded by heights, is not defensible as a military post. It is inferior to Constantinople, Cairo, and Damascus, with regard to situation, magnitude, population, opulence, and courtly splendour, but may be reckoned superior to these cities in the salubrity of its air, the solidity and elegance of its private buildings, and also the neatness and convenience of its streets. In Arabic, Aleppo is called Haleb, to which is usually added the epithet Al Shahba. The Arabian writers, some of them, trace the origin of this city to the migration of the patriarch Abraham into the land of Canaan, who rested for some time on the hill, where the castle of Aleppo is now situated, the appellation Haleb is derived from the circumstance of distributing milk to the poor of a neighbouring village. Their frequent repetition of the words 'Ibraheem haleb,' or 'Abraham has milked,' gave occasion, as it is said, to the name Haleb, which was conferred on the town that was afterwards built on this spot. The epithet Al Shahba is referred to a pied cow, distinguished by its lowing in the herd of the above patriarch. Golius and others, however, with much greater probability, deduce this term, which denotes a variegated grey and white colour, from the colour of the soil, and of the buildings. Some have supposed that Aleppo was the Zobah of Scripture; but it was, more probably, the Berea of the Greeks. Aleppo is situated, according to celestial observations, (see *Conn. des Temps*, 1792,) in N. lat. $36^{\circ} 11' 25''$. and E. long. $37^{\circ} 9'$. at a considerable height above the level of the sea. Its distance from Scanderoon or Alexandria, the nearest sea-port, is in a straight line, between sixty and seventy miles; but in the caravan road, between ninety and one hundred miles. It is encompassed at the distance of a few miles, by a circle of hills, which are in general rocky, scantily provided with springs, and totally destitute of trees, but affording good pasture for sheep and goats. Within this circle, there are hills and hillocks, which are intersected by plants and little valleys; the soil of which is in some parts of a reddish or black colour, rich and fertile, but in general whitish, shallow, and mixed with many small stones. This city, including its extensive suburbs, occupies eight small hills, the intermediate valleys, and a considerable extent of flat ground, comprehending in the whole a circuit of about seven miles. It has nine gates, two to the east, three to the west, two to the north, and two to the south. One of the northern gates, formerly called the Jews' gate, which the son of Saladin changed into Bab al Naser, or Gate of Victory, was once, according to the missionaries, the residence of the prophet Elisha, and it has lamps which are kept constantly burning in commemoration of him. The

castle, which stands on a hill near the north-east corner of the city, and which is encompassed by a broad deep ditch, about half a mile in circumference, partly wet, and partly planted with trees, may be distinguished at a considerable distance; it is deemed impregnable, and is entered from the south by a bridge of seven lofty narrow arches thrown over the ditch, on which are two gates fortified by turrets, and two more still higher on the hill. Near the summit is a reservoir of immense depth, from which the water, supposed to be derived from a spring five miles distant, is raised by a wheel. A numerous garrison is kept here, but the privates are allowed to follow their trade in the city, and return before sun-set. The castle, in reality, is of no use but as a great magazine for military stores, and in serving to overawe the citizens; but a traveller, approaching from the west, can see scarcely any other part of the city, till he gains the brow of one of the hills within two or three miles of the gates; and thus it becomes an extensive and striking object.—The mosques, the minarets, and the numerous cupolas, form a splendid spectacle, and the flat roofs of the houses which are situated on the hills, rising one behind another, present a succession of hanging terraces, interspersed with cypress and poplar trees. Although at a distance this city, like many others in the east, assumes a fine appearance, and from the very great splendour of the buildings, already enumerated, excites an unparalleled interest in the eye of the spectator, nevertheless the traveller is disappointed on his entrance, for the streets are gloomy, and appear narrower than they are in reality, in consequence of the disproportionate height of the stone walls on both sides, which exhibit but a few windows, and these guarded with lattices. Some of the streets are spacious, and well paved with bricks in the middle, the ends being placed uppermost for the convenience of the horses. There are two raised footpaths on the sides, and sometimes a beautiful vista is opened, by looking through several arches in succession. They are defended from the sun by mats spread on wooden rafters, projecting from each side. The bazar gates are regularly shut at sun-set, and watchmen, provided with a pole and lamp, are stationed for the night within them. There are also gates and watchmen in the principal streets. The natives, who are for the most part sober and regular, retire to their habitations early. The houses are spacious, and clothed with terraces and sky-lights, those that have domes excepted. During the summer, the inhabitants sleep on these terraces, which are separated by parapet walls. From their equal elevation, and doors of communication, which the Franks have made, a considerable circuit may be made without descending into the streets. The natives, however, have no intercourse by the terrace, and guard, by high walls, against being overlooked.

The mosques in Aleppo are numerous; and are built of free-stone, with domes in the centre covered with lead. Of these, seven or eight are considered magnificent, though none have more

than a single minaret, or steeple, whence the people are summoned to prayers. These minarets are said to have been first annexed to the mosques by Al Waleed, who succeeded to the caliphate, in the eighty-sixth year of the Hegira. Into these mosques none but Moslems are permitted to enter; and at Aleppo, it is only one of them into the court-yard of which Jews and Christians are allowed admission. The Greeks, Syrians, Armenians, and Maronites, have each a church. The public edifices, next in importance to the mosques, are the khans or caravansaries, intended principally for the accommodation of strangers, and goods. These are of a quadrangular form, one story in height, having rooms, which serve as chambers, warehouses, and stables. The bazars, or markets, are lofty stone edifices, arranged in the form of a long gallery arched above, or roofed with wood, where small shops are replenished with goods, each different kind of business having a distinct bazar, which is always locked at sunset. The public baths, or hummums, do not contribute much to the embellishment of the city, as their fronts to the street are very simple; but the coffee-houses, which are spacious and handsome, and dispersed through all quarters of the town, attract the notice of strangers. They are gaudily painted, and furnished with matted platforms and benches; and those of the better sort have a fountain in the middle, with a gallery for musicians. At certain hours of the day the coffee-houses are full of company, though they are not frequented by persons of the first rank. The dwelling-houses of Aleppo comprehend the seraglios, or palaces, the houses of the opulent merchants, and the habitations of the middling and ordinary people. The seraglio, in which the bashaw of Aleppo usually resides, is situated near the castle, and is a very ancient and extensive building, surrounded by a strong and lofty wall. The gates of this edifice lead to several interior courts, which are destined for barracks, stables, an hippodrome, and various other offices. The principal building contains apartments for the bashaw, his harem, household officers, and pages. It consists of three courts, one of which is the divan, where the bashaw gives public audience. The whole of this building is much neglected, and if it had not been originally a very substantial edifice, it would long ago have been in ruins. There are five or six other seraglios of more modern date, that are much smaller, well built, and gaudily decorated; they were erected at different periods by former bashaws, and belong to their heirs. They are now occasionally let to such governors as do not choose to reside in the old seraglio, and to other officers of the Porte, who visit Aleppo on public business. Other buildings, constructed on the same plan with these, though not denominated seraglios, are occupied by the principal agas and effendees.

To the lower class of strangers, as Arabs, Kurds, and other Turks of foreign extraction, and Armenian Christians, there is appropriated a kind of accommodation, called Keisaria, which is a large area, surrounded by a number of mean, low houses, each consisting of two or three rooms. Other buildings, in the form of a close

or court, allotted to weaving and other manufactures, are called by the same name.

The castle of Aleppo is in a bad state, and were it not for its importance as a magazine for military stores in times of war with Persia, for the awe of the city, and an asylum to the magistrates in case of insurrection; as a prison for state criminals, and a place of execution for the Janissaries, when condemned to die, it would scarcely be preserved. The Aga of the castle is immediately dependent upon the Porte, and subject, only in certain cases, to the bashaw, he commands a numerous garrison; and the private men, with their families, lodge in the castle.

The fuel used at Aleppo is wood and charcoal, the former of which is brought on camels from the mountains. Little fuel is made use of, except in the kitchens. The mode of heating the bagnios renders them an absolute nuisance; the dung of animals, the parings of fruit, the refuse of stables, and offals of every description being employed for the purpose. Camels and sheep's dung, with brushwood, or the stalks of different kinds of plants which grow in the desert, are more commonly used for fuel. Cow-dung is resorted to by the peasants, not only for fuel, but for forming a sort of pan, in which they and the Arabs frequently fry their eggs. At Aleppo, in one of the suburbs called Mashirka, they have a glass manufactory, and a tannery to the south-west of the town near the river. Their slaughter-houses are situated in an airy field, in the skirts of the suburbs, towards Bankusa, and their principal flesh market is in the suburb called Ideida.—They have several lime-kilns near the walls, on the south-west of the city, and a manufactory of catgut half a mile to the south, which occasionally emits a very offensive stench. Within the walls, they have only one public burial ground, besides several private cemeteries; but without the walls the burial grounds are of wide extent round the town, whose white tombs and grave-stones, viewed at a distance, forcibly strike the attention.

The city is supplied with water by means of an aqueduct from two springs, near a village called Heylan, at the distance of about eight miles to the north. This aqueduct, which is said to be coeval with the city, was repaired by the empress Helena, the mother of Constantine, and again repaired and enlarged by the son of Saladin, in 1218. It is mostly open, but partly subterraneous, and distributes the water by earthen or leaden pipes to the gardens of Babullah, to the fountains, baths, and private houses. The gardens of Babullah extend about twelve miles, and generally belong to some effende or aga, possessing sufficient authority for the protection of his tenants, or forms a part of some religious estate. Those also on the banks of the river Kowick, are numerous and fine. They are subdivided into fields, of different shapes and dimensions, bordered with dwarf trees, flowering shrubs, and taller trees, such as the plane, weeping-willow, ash, and white poplar. Within these enclosures are cultivated mad-apples, melons, and cucumbers, with a variety of esculent roots, cabbages, and greens for the kitchen; in others, cotton, tobacco, sesamum, palma christi, and lucern; and some are sown with barley, which

is used in the spring as green fodder for the horses. Among these enclosures are large plantations of pomegranate, plum and cherry trees, and sometimes groves, composed of the various fruit trees which the country produces. The gardens, those of Babullah excepted, are supplied from the river by means of Persian wheels. In most of the gardens there are summer-houses, furnished with fountains, and with kiosks, or a kind of balconies, projecting over the river. The Aleppo gardens are spoken of with rapture by the natives. They supply the city with greens and fruits, and contribute both to the health and amusement of the inhabitants.

In the vicinity of the city are many extensive quarries, which afford a gritty stone, when first dug easily cut, and indurated by exposure to the air; and the more ancient of these quarries have subterraneous excavations of great length, which serve the Bedowen Arabs for winter habitations, as stables for the camels, and as dens of debauchery to the Janissaries. The marble of Aleppo is of a yellowish colour, but by rubbing it with oil, and exposing it to the moderate heat of an oven, it is made to resemble the red marble of Damascus. An extensive plain, called the valley of salt, or salt lake, eighteen miles from the city, supplies the inhabitants with that article.

The climate of Aleppo may be characterized as, upon the whole, mild. The heat, indeed, is great during the summer months of July and August, though it is generally moderated by westerly breezes. But it is intense when the wind proceeds from the north-north-west, east, north-east, or south-east, and all the inhabitants, both native and foreign, are then oppressed with an excessive lassitude, an oppression of the breast, and a parched sensation of the eyes, lips, and nostrils. These winds do not occur every year, nor do they produce such fatal effects as the desert wind. In general, the air of Aleppo is dry, piercing, and salubrious. The spring commences in the early part of the month of February, about the middle of which the almond-tree blossoms, and the fields become clothed with verdure. In May the corn ripens rapidly into harvest. Refreshing showers fall in the beginning of June, after which drought prevails till the middle of September. From about the close of May to this time the inhabitants usually sleep on their terraces, without sustaining any injury. The severest part of the year is from the middle of December to the latter end of January, when frost is common, though snow is comparatively rare. At the end of August the Nile-clouds, as they are called, make their appearance, and are often attended with dew. About the autumnal equinox the air is refreshed by showers, which are termed the first rains, and are usually preceded by irregular gusts of wind that raise the dust in vortices. These are succeeded in twenty or thirty days by the second rains, which are more plentiful than the first, and after them the weather becomes variable and much cooler. The transition from the Autumn to the Winter is slower than that from Spring to Summer. The trees retain their leaves till the beginning of December, and the most

delicate persons have no fires till the middle of this month. The rigour of winter commences about the middle of December, and lasts forty days; but though there is almost always some frost in winter, many years pass without snow. The narcissus is in flower during the greatest part of the winter, and violets and hyacinths are plentiful in January. Although violent storms of wind are rare at Aleppo, squalls, accompanied with heavy showers, and sometimes with thunder, are frequent in the Spring and Autumn. Lightning, unaccompanied with thunder, is frequently seen in the night during the months of September and October; and it is sometimes seen in Summer; but the nocturnal sky, in the hot months, is almost always serene, exhibiting a glorious scene to the astronomer, who may indulge his study, and at the same time enjoy the cool air on the terrace.

The soil near Aleppo, in the more distant plains, consists of a reddish, sometimes of a blackish, light mould, and produces the fruits of the earth in great abundance. The fields near the city yield, in consequence of much manure, two or three crops of different kinds every year; but without manure, they are only sown once a year with different sorts of grain alternately, but are seldom suffered to remain fallow. They begin to plough in September; and the plough is drawn, by one or two small cows, or by a single ass, in furrows so straight, that one would imagine a line must have been used in tracing them. They sow wheat, barley, lentiles, chiches, beans, chickling, small vetch, a small green kidney bean, and Indian millet. The earliest wheat is sown about the middle of October, and barley so late as the end of February. They seldom use the harrow, the grain being covered by repassing the plough along the edge of the furrow; in sandy soil, they sow first, and then plough. The barley harvest commences in May, about ten or fourteen days before that of the wheat, and early in June corn of every kind is taken off the ground. Among the reapers in Syria, a custom prevails of accosting a passing traveller and presenting to him a handful of corn, with a general shout; and a small present is expected in return. The corn, when reaped, is carried on asses to the summit of the nearest hill, and, being laid on hard even ground, is separated from the chaff, not by threshing, but by means of a sledge fixed on two or three rollers, and armed with several iron rings, with serrated edges, so sharp as to cut the straw. This machine is drawn by oxen, mules, or asses, and driven by a man seated on the sledge, and as it passes circularly over the corn spread beneath, the grain, by repeated operations, is trodden out, while the straw is chopped by the iron rings. The chaff and bruised spikes are then separated from the grain, by throwing up the whole into the air with wooden shovels, when the wind blows moderately. The spikes that have been imperfectly trodden are again submitted to the sledge. When the grain has been afterwards more perfectly winnowed and separated from the straw, it is thrown together in a large heap, and is then divided in a stipulated proportion between the husbandman and

the landlord. The cattle employed in the harvest are left unmuzzled at the heap, as the Scripture mentions. See Lowth's Com. on Isaiah, ch. xxviii. v. 27, 28. Notes, p. 130. The grain is then removed to granaries, which are subterranean grottoes, with one round opening at the top, which, when the magazine is full, is shut close and covered with earth, and thus completely concealed from the enemy. The corn is chiefly ground in mills wrought by mules, though there are some water-mills upon the river Kowick, and among the lower people by hand-mills. Wind-mills are unknown.

The olives produced at Aleppo resemble the Spanish olives, but are not so large, and the annual produce of them is inconsiderable. The city is supplied with oil from other parts, and particularly from Edlib and adjacent villages, where the olive plantations are more extensive. Large quantities are employed in making soap, and the ashes employed in this manufacture are brought from the Desert by the Arabs. The gardens afford several varieties of grapes; those that are ripe appear in the market in September, but the vintage is not at its height till the middle of November. The dried fruit of the vine affords part of the food of the inhabitants; it is eaten with bread and used in sherbets; a large quantity of raisins is also used in the distillery, carried on both by Turks and Christians. Anniseed is added in the distillation, and the spirit, which is very strong, is called araki. The inspissated juice of the grape is much used by the natives; it is called dibs, and much resembles coarse honey in appearance. It is brought to town in goat skins, and serves for the common people instead of honey. The pistachio tree is diligently cultivated, and the nuts reckoned superior to those of any other part of the world. Pliny, lib. xiii. c. v. lib. xv. c. 24, says, that pistachios were first brought from Syria into Italy, by Lucius Vitellius, in the reign of Tiberius; and Galen, *De Alim. Facult.* lib. ii. c. 30, mentions Berœa as famous for that fruit in his time. Large quantities are exported from hence to Europe. The nuts of the wild pistachio are brought to town from the mountains; the tree not growing near Aleppo. The white mulberry is common in the gardens, and brought to market in May, and the fruit of the red mulberry, which is not ripe till two months later, is delicious. Very little silk is made at Aleppo; that which is exported from hence to Europe, by way of Scanderoon, is chiefly the produce of Antioch and the adjacent mountains, or it is brought to Aleppo from places more distant. The pomegranate is common, and ripens towards the end of August. The markets are supplied with several varieties of figs; but the middle sized yellow fig is the most esteemed. The gardens also produce other fruits, as cherries, apricots, peaches, plums, apples, pears, quinces, cornelian cherry, almonds, walnuts, hazel-nuts, jujubes, and sumach; the former of these two last being much valued as a medicine, and the latter as an ingredient in cookery. Oranges, lemons, and citrons, were formerly produced in the orchards of Aleppo; but as they are not now cultivated, it has been inferred from this

circumstance, that the winters in Syria are now more rigorous than they were in former times, and this is the opinion entertained by the natives. Among the vegetables which form part of the diet of the inhabitants, the mad-apple (*Solanum Melongena* of Linnaeus,) of which there are three varieties, claims a principal place. Of the vegetables produced in the fields without culture there are capers, borage, common mallow, sorrel, dandelion, water-cress and truffles. Savory is used to give a relish to their bread.

The inhabitants of Aleppo consist chiefly of Turks and Arabs; many among them, to the amount, perhaps, of four thousand, claim descent from Mahomet, and wear their dress intermixed with green, as a token of this distinction. They are not at present held in very high esteem, owing to their superciliousness and contentious spirit, although, formerly, they were greatly revered, and any injury done to them was severely punished. The extent of the population is variously estimated. Dr. Russel, whose calculations ought probably to be most relied upon, states it at 250,000, of which 30,000 are Christians, and 5000 Jews. The population of this place and neighbourhood is thought to be on the decline, in consequence of exactions practised on the inhabitants by a despotic and oppressive government. The domestic servants are nearly all Armenians.

The men dress in the long eastern habit, and during six months in the year wear furs. Under the furs their garments consist of a silk or linen shirt, and drawers, wide trowsers of red cloth, to which are sewed socks of yellow leather, serving for breeches, stockings, and, within doors, for shoes; but in walking, they use slippers without heels. They also wear a waistcoat, called a kumbaz, that comes lower than the knee, and a long vest reaching down to the heels, which covers all, is named a dulaman. Above the dulaman, they have a long Persian shawl, and a belt under the waistcoat, and to this cincture they attach a small dagger or knife, and men of business a silver inkhorn. The turban is commonly worn. The Abai is a silk or camblet gown, with large sleeves, laced down the seams with a narrow gold lace, which is worn in summer instead of the kurk, or loose gown trimmed with furs. Abai is the name of the ordinary vestment of the Arabs. The dress of the ladies in many respects resembles that of the men. But their dulaman and kumbaz sit closer to the shape, and, not folding over the breast, leave the neck uncovered. Instead of the costly, long-haired furs of the men, they use sable or ermine, and they are formed in a different fashion. The ladies are fond of thick long hair; and their head-dress, consisting of a warm cloth cap, under cotton and muslin, which compose the rest of the attire, is much warmer than that of the men. They wear ear-rings, a necklace, or collar, of gohl, large clumsy gold bracelets on the wrist and ankles, a string of zechins close to the hair on the forehead, and another, very long, across the body like a sash. Both sexes wear rings on their fingers, and some women wear them on their toes. The use of rouge is not much known, but the women tinge their fingers and hands, also their toes and feet, of a dusky red

or yellow, with a paste formed of the powdered leaves of henna and water. These parts are afterwards covered with another paste composed of flour and water, with crude sal ammoniac and quicklime, which changes them to a very dark green. The inside of the eyelids are tinged with a powder called kohol. The women apply another composition called khatat to the eye brows, which tinges them of a fine black, and makes the hair smooth and glossy. The men, after a certain age, or after performing the pilgrimage to Mecca, let the beard grow, and bestow much pains upon it. The Turks wear whiskers, and persons of both sexes use a variety of perfumes, of which sandal wood, musk, and spikenard are the most common. The women never appear in the streets without their veils, which in general are a linen sheet covering the whole habit from head to foot, and concealing the whole face except one eye. Those of the Christian and Jewish women are of plain white calico, which the Turkish women chequer with blue and red. The Jewish women have one arm free. Women of every class, when they go abroad, wear thin yellow boots, reaching half way up the leg, over these yellow babooge or slippers; and in wet weather wooden clogs, called kabkal. Women are never seen in the streets after dusk. They are always particularly anxious to keep the crown of the head covered, which scarcely any consideration can induce them to bare. Though society is deemed the most polished here of any part in the Turkish dominions, the females are said to be addicted to intrigue, whenever it can be secretly conducted,

Trade is carried on in Aleppo to a very considerable extent, both by Christians and Mahomedans. Four caravans proceed annually through Natolia to Constantinople, and others arrive from Bagdad and Bassora, with coffee and India muslins and shawls. The Turks carry on the trade of India, Asia Minor, Constantinople, and Egypt. The exports are cloth, from Antioch, Merlin, and other places; osnaburghs, from Aleppo and Damascus; and printed cottons, from Diarbekir; galls, drugs, and various other articles. The imports are considerable; cloths, Lyonnese stuffs, and bonnets, from Europe; mercerics, indigo, tea, sugar, paper, soap, and numerous coral ornaments. Commerce with Europe has of late years much declined, and the European establishments in the city consequently reduced.

Generally speaking, the inhabitants of Aleppo are sedentary in their mode of life and habits, and are somewhat addicted to amusements, though not at all disposed to exercise. The men frequent the coffee-houses, where they are entertained with music and dramatic representations. The women often attend the baths, where persons of every class in society are admitted, in an indiscriminate manner, till they are full. At these places music and refreshments are provided, parties of pleasure formed, and all the splendour of attire that can be mustered, is brought into view. Dancing is not reckoned a genteel accomplishment for people of condition, and even among the vulgar it is seldom practised, unless by such as make it their trade. The coffee-

houses are entertained by a band of music, a puppet-show, and a story-teller. The Aleppians have, in general, a correct ear, and are fond of music. The instrumental music is of two kinds; one martial and loud, intended for the field, and the other less sonorous, adapted to the chamber. A band of music, belonging to the castle, smaller than that of the bashaw, performs regularly twice a day from the battlement, and the bashaw's band also performs twice a day in the court of the seraglio.

With regard to nuptial contracts and ceremonies at Aleppo, they are similar to those generally observed among the Turks. When a matrimonial engagement is projected, the proposal is intimated to the mother of the intended bride, and the relations on both sides proceed to make the necessary enquiries. If the result prove satisfactory, the young woman is formally demanded of her parents by the father of the young man. Substitutes are then appointed to stipulate the necessary conditions; and these proxies adjust the sum to be paid to the bride's father, with other articles of the marriage contract. When the money is paid, the contract is regularly signed and sealed, and then the Cadi grants his licence for the marriage. About ten days before the wedding, the bride is invited by her female relations to the bagnio, and there she is entertained till the day preceding the marriage, when they proceed to apply the henna. At Aleppo it is customary for the father of the bride to make some addition to what is paid by the bridegroom, and to lay it out for the benefit of his daughter; but among the Bedouin inhabitants, and in the villages, the father usually retains a part of what he receives for his daughter; and in this respect they may be said to sell their daughters. This custom of purchasing wives is practised by all the oriental Christians, as well as the Turks, and appears from the sacred writings, to have been the ancient practice. Accordingly, among the Arabs, daughters constitute the riches of a family. On the nuptial day, the women go in procession from the bridegroom's house to fetch the bride, who is brought home amidst the acclamations of the women, accompanied by her mother, and several other female relations. The procession is in the day time, and at Aleppo they do not carry tapers, as some travellers have reported. On their arrival in the house, the remainder of the day is spent in feasting and music. When the bride, covered with a veil of red gauze, and dressed in her wedding garment, has been introduced to her husband, the relations withdraw, and continue singing and feasting till morning; and the nuptial rejoicings last several days. The mother for the most part suckles her child, unless prevented by incapacity, and the child is seldom kept at the breast less than two years, sometimes three or four; and the mother often suckles during the whole time of pregnancy. During the first week the child is swaddled, and then dressed in clothes which are more loose and easy; and as soon as they are able, they are left at liberty to crawl about on the carpet. When children can support themselves, they are usually carried astride on the shoulders; and the expression used by Isaiah, ch. ix. v. 4, upon which

bishop Lowth comments, Notes on Isaiah, p. 258, viz. הַלְבָדֵל is literally that which is now used by the Arab women. The difference of carrying a child in the bosom or on the shoulder, referred to, Isaiah xlix. 22, and noticed by Harmer, Obs. on Scripture, vol. ii. p. 366, may be owing to their different age, without regard to sex.

In the funeral ceremonies practised at Aleppo, the women perform a conspicuous part.—When a person is dangerously ill, one or two sheiks are employed to read portions of the Koran, and to pray by the bed-side. At the approach of death, the attendants turn the face of the dying person towards the keblah, that is, towards Mecca. When he expires, the women in the chamber give the alarm, by shrieking, as if they were distracted, and are soon joined by all the other females in the hamam. This conclamation is termed the Wulwaly, and is so shrill as to be heard, especially in the night, at a prodigious distance. Schultens in his commentary on Job, x. 15, tom. i. p. 978, considers the Arabic Wulwal, as corresponding to the Hebrew הַלְבָדֵל, and to the Greek ὀλολυζω and ἀλαλαζω, and he supposes that the former Greek word was applied in a joyful sense. However, the Arabic wulwaly is applicable only to distress and affliction, and seems to have a greater affinity to the latter term than to the former, which was commonly used by the Greeks on sacred or joyful occasions. See *Mark*, v. 38.—Plutarch refers to this practice in his account of Portia's fainting on the day of Caesar's death, when her maids, apprehending that she was dead, wailed over her. *Brutus*, Oper. tom. i. 991. We also learn from Cicero *De Legibus*, lib. ii. Oper. tom. iii. p. 221, ed. Olivet, that the extravagant exclamations of women at funerals was prohibited by the twelve tables. See *PREFACE*. In a few hours the corpse is prepared for interment by ablution, and by stopping all the natural passages with cotton, sprinkling parts of it with a powder composed of spikenard and other aromatic herbs, and wrapping it up in a cotton winding-sheet. Over the bier, at the head of which is fixed a batoon, on which the man's turban, or the attire of the female head, is placed, is thrown a black pall, and over this the best wearing apparel of the deceased. The funeral procession is attended by the acquaintance and kindred of the deceased : a number of the sheiks, some of whom, incessantly repeat Ullah, Ullah, and others chant verses of the Koran : and one person is the chief mourner, and manifests her grief, real or fictitious, by the most extravagant and frantic cries and gestures. Other mourners are sometimes hired, who, at intervals, join the general wulwaly. A funeral service is performed by the imam in some neighbouring mosque, and the corpse is then deposited in the grave, in a reclining posture, with the head to the west, and the face turned towards Mecca. A handful of earth is then thrown by the imam, or sheik, after a funeral service, into the grave, which is also done by others who stand near, and who at the same time pronounce a short benediction; after which the grave is filled up. The funeral service in use among the

Kurdeens is very laconic, and is as follows :—‘ If thou hast taken away, thou shalt restore ; if thou hast given, it shall be restored to thee ; and if thou doubtest this, thou shalt now be convinced.’ The funeral service, recited by the imam at the grave, is as follows: ‘ O man ! from earth thou wast at first created, and to the earth thou dost now return : this transitory abode being the first step of thy progress to the mansions of eternity. ’ If, in thy actions in life, thou hast been beneficent, God will pardon thy transgressions ; and if thou hast not, still the mercy of God has no bounds. But remember what thou didst profess in this world, that God is thy Lord, and Mahomet thy prophet—and thy belief in all the prophets and apostles, and that God’s forgiveness is amply extended.’ The sepulchre is visited by the near relations on the third, seventh, and fortieth day after the interment ; they also celebrate the anniversary : solemn prayers are offered at the tomb for the repose of the deceased, and victuals and money are distributed to the poor. The tomb is besprewed by the women, in their visits, with flowers and aromatic herbs ; and the wulwaly is repeated. The men make no alteration in their dress as a mode of mourning ; but the women lay aside their jewels, dress in their plainest garments, and wear on the head an embroidered handkerchief of a dusky brick-dust colour.—They commonly mourn twelve months for a husband, and six for a father.

Crimes of a capital kind are very rare at Aleppo. The usual capital punishments are hanging, beheading, strangling, and impaling. Janissaries are strangled, not with a bow-string, but by a cord put round the neck, and then twisted with a stick in the manner of a tourniquet. The bodies of all who are executed remain for some days exposed to public view. Theft is uncommon ; when it occurs, it is sometimes punished by amputation of the hand, but more commonly with the bastinado, which is performed with rods about the size of a small walking-stick ; and this is the usual punishment for offences of an inferior kind. Banishment to the island of Cyprus, and the maritime towns of Syria, is chiefly employed for removing turbulent members from the city or the divan.

The state of literature at Aleppo is much degenerated from that of ancient times, when it was more respectable. There are indeed public day-schools adjoining to some of the principal mosques, but their colleges for students in advanced life are few in number, and poorly encouraged. They are more properly seminaries of pedantry and superstition than of science ; and they are chiefly frequented by the studious of the poorer class, who dedicate themselves to the service of the mosque. Grammar and school-divinity are the subjects chiefly taught at college. The effendees, who assume an appearance of respect for learning, have no liberal notion of science. Astronomy, which was once a favourite study among the Arabs, is at present wholly neglected. Although they have books on the subject in their libraries, and some instruments, yet so little is known of the science at Aleppo, that a person who is found capable of calculating

eclipses, has, on this account, the reputation of a most profound astronomer. Almanacks are seldom constructed at Aleppo, but are brought thither from Constantinople or Cairo. As to mathematical studies, they are little attended to by the modern Arabs; nor have natural history and the experimental parts of philosophy made any progress amongst them for several centuries. History is little regarded by the literati at Aleppo. Their knowledge of distant states, and of the revolutions of empire in the western world is very partial and imperfect; and even their own history, before the appearance of their prophet, remains in great obscurity. Their geographical knowledge also lies within very narrow bounds; nor have they any good maps, except such as have been imported from Europe. Superstition has banished painting from Syria; and music, degraded by fashion to a mercenary profession, is rather tolerated than encouraged; poetry, which was formerly much cultivated among the Arabs, has very perceptibly declined and languished; so that the modern Aleppo bards never attempt any performance beyond a dirge, a ballad, or an epigram. Although the medical practitioners at Aleppo are numerous, their knowledge of medicine is superficial, perverted by prejudice, and accompanied with pedantic affectation, arrogance, and obstinacy. A very competent judge affirms their general practice to consist in specious trifling. Their knowledge of anatomy is acquired by reading, not by dissection; and their ignorance of the circulation of the blood, leaves them quietly in possession of the ancient doctrines. The most calamitous disease to which they are subject is the plague.

The epidemical diseases most prevalent in Aleppo are, continual fevers, intermittent and remittent fevers, regular and anomalous, erratic fevers, commonly attended with diarrhoea; the dysentery, quinsy, pleurisy, peripneumony, rheumatism, and ophthalmia. The sporadic and chronic diseases are, with few exceptions, nearly the same as in Britain. Those which are most common at Aleppo, are pulmonary complaints, spitting of blood, and consumptions, obstructions of the abdominal viscera, cachexy, jaundice, dropsy, inguinal ruptures, the haemorrhoids and worms. The tinea is common, and various other cutaneous eruptions; but the true or confirmed leprosy is now become obsolete in Syria. The

venereal disease is also very common in this country. The Europeans soon after their arrival at Aleppo are subject to a fever, which has been distinguished by the name of l'oca, or goose. The disease attacks but once; and the English are rather more liable to it than the Provençals and Italians. The natives of Aleppo and European strangers, after some residence here, are subject to a singular kind of eruption; which from the supposed time of its duration, is denominated the botch of a year, or the ring-worm or pimple of Aleppo; but by the Europeans and Turks, il mal d' Aleppo, the Aleppo evil, and the Aleppo ulcer. No part of the body or limbs is exempt from this eruption; but it most commonly fixes on the face, and leaves a scar, with which almost all the inhabitants are disfigured. Volney suspects that it proceeds from the quality of the water. Dr. Russell has particularly described it: and he observes, that the mercurial plaster was the most efficacious remedy.

The animals, birds, &c. of Aleppo, will be treated of in the geography of the district. One species of pigeon, however, claims a slight degree of attention.

Speedy intelligence was of such importance in Aleppo, that the carrier-pigeon was employed to convey notice from Scanderoon or Alexandretta, and Bagdad, to Aleppo. It is the peculiar quality of this bird to find its way through the air from incredible distances, to which it has been conveyed hood-winked, or in a covered basket, and with a velocity no less surprising. But this practice can only be adopted during the period of incubation, or while its young are unfledged; and a kind of training is required. Damiri, an Arabian author, affirms, that it can traverse 450 miles in a day; and, according to Maillet, a French writer, its flight is at the rate of sixty miles an hour. Thus it may easily be believed, that intelligence was conveyed in two hours and a half through the distance of seventy miles, from Alexandretta to Aleppo. The practice has been discontinued in Syria for some time; but during its existence, it is said that a merchant of Aleppo having accidentally killed a carrier-pigeon, discovered from the billet under its wing that a scarcity of galls prevailed in England; and, availing himself of the information, made such arrangements as enabled him to realize a fortune.

ALEPYRUM, in botany, *a*, without, $\lambda\epsilon\pi\nu\rho\rho\nu$, a bark, shell, or covering, i. e. of corollaceous glumes, by which this genus is distinguished from Devauxia; class and order, monandria polygynia. Nat. Ord. Restiaceæ,

Gen. Ch. CAL. sheath of two concave, keeled, permanent valves, clasping each other at the base, containing one or more flowers: cor. none: STAM. filament one, capillary, drooping, about as long as the calyx; anther simple, oval: PIST. germens several, six to eighteen, ovate-oblong, superior, inserted into one side of a central oblong receptacle, and all turned one way; styles as many, thread-shaped, combined at the bottom, spreading or deflexed at the upper part: STIGM.

linear, downy: PERICARP. capsules as many as the germens, membranous, oval, of one valve, and one cell, bursting longitudinally at one side: S.EED. solitary, obovate, pendulous. Essential characteristics, sheath of two valves; cor. none, ANTH. simple; GERM. unilateral: CAPS. bursting longitudinally at one side: seed solitary.

Also a genus of small herbaceous plants, nearly allied to the more numerous one of Devauxia, and scarcely to be separated therefrom, the want of petals in Alepyrum being the only difference. The three species are all natives of the south coast of New Holland, nor do they appear to have been met with by any botanist or collector, excepting Mr. Brown: ROOTS fibrous: leaves

radical, simple, linear-lanceolate, or setaceous : flower-stalks radical, unbranched, single-flowered. 1. A. polygonum : many-jointed Alepyrum, sheath single-flowered ; the outer valve with a leafy point : GERM. from fifteen to eighteen ; stalk twice the length of the leaves. 2.

A. Pumilio, dwarf Alepyrum ; sheath single-flowered ; the outer valve with a leafy point : GERM. from six to nine ; stalk the length of the leaves. 3. A. muticum, pointless Alepyrum ; sheath with a few flowers ; the outer valve pointed.

ALERIA ALALIA, OR ALARIA, in ancient geography, a town of Corsica, mentioned by Ptolemy, situated near the middle of the east side of the island, on an eminence, near the mouth of the river Botanus, built by the Phoenicians. Afterwards Sylla planted a colony here. It is now in ruins, and called Alleria Distrutta.

ALERION, in heraldry. See **ALLERION**.

ALERT', } Ital. All' erte, al' erta, par-
Alert'ness. } ticipial adjective from the verb
ergere; Lat. erigere; estre à l'erte, to observe,
or watch from a high place—a military phrase
formed by a combination of French and Italian.
See Cotgrave. ‘Stare à l'erta, to be watchful.’
Florio's Italian Dictionary.—Watchful, brisk,
lively.

Thir nobill nymphis maid reverence,
With gestour lively and allairt ;
And after their obedience,
Hir grace passit to ane adder pairt.

Burel in *Sibbold's Chronicles*, v. iii. p. 470.

That alertness and unconcern for matters of common life, a campaign or two would infallibly have given him. Addison, *Spectator*.

Not such the alert and active ; measure life
By its true worth, the comfort it affords,
And their's alone seem worthy of the name.

Couper's *Task*.

ALES, (Alexander) a divine of the confession of Augsburg, born at Edinburgh in 1500. He entered the lists very early against Luther, but became at length a perfect convert to the Protestant religion. The change of religion which happened in England after the marriage of Henry VIII. with Anna Bullen, induced Ales to go to London in 1535. He was highly esteemed by Cranmer, archbishop of Canterbury, Latimer, and Thomas Cromwell, who were at that time in high favour with the king. Upon the fall of these favourites, he was obliged to return to Germany : and the elector of Brandenburgh appointed him professor of divinity at Frankfurt upon the Oder, in 1540 ; but leaving this place upon some disgust he returned to Leipsic, and died in March 1565. He wrote a Commentary on the writings of St. John, on the epistle to Timothy, and on the Psalms.

ALES, a name given to a compound salt ; it also signifies contracted, when used by physicians as an adjective.

ALES, a river of Roxburghshire, which rises in Selkirk, and falls into the Tiviot, a little below Ancrum.

ALESA, ALESA, OR HALSEA, in ancient geography, a town of Sicily, on the Tuscan sea, built, according to Diodorus Siculus, by Archonides of Herbita, in the second year of the 94th Olympiad, or A. A. C. 403 ; situated on an emi-

nence about a mile from the sea ; now in ruins. It enjoyed immunity from taxes under the Romans.

ALESANI, a town and jurisdiction of Corsica, consisting of nine villages, in the district of Aleria, which see.

ALESHAM. See **AYLESHAM**.

ALESIA, in ancient geography, a town of the Mandubii ; called also Alexia, by Livy and others ; situated on a very high hill, whose base was washed by two rivers. The town was of such antiquity, that Diodorus Siculus relates it was built by Hercules. It is now called the city of Alise, in the duchy of Burgundy, near Dijon.

ALESSANDRIA, in Egypt. See **ALEXANDRIA**.

ALESSANDRIA, or **ALEXANDRIA**, is a strong town, with a citadel, lying in a marshy country on the east bank of the Tanaro, in Upper Italy. It is the see of a bishop, the suffragan of the archbishop of Turin. It contains, besides the cathedral church, twelve parish churches, two collegiate churches, seventeen monasteries and nunneries, together with several fine private buildings, and had in the year 1806, 35,216 inhabitants. The yearly fairs held here at the end of April and beginning of October, are attended by merchants from all parts of Italy, and even from France and Switzerland, being inferior to none in Italy, except those of Sintegaglia. This town and fortress were founded in the latter half of the twelfth century by the Lombard league, formed to oppose the emperor Frederic I. The French made themselves masters of the town and citadel in the war of the Spanish succession, but were dispossessed by prince Eugene in 1706. In the invasion of Italy by Buonaparte in 1796, the fortress of Alessandria was given up to the French conditionally, by the armistice of 28th April, and definitively by the treaty of 15th May. It remained in their hands above three years ; but after the defeat which the French sustained at San Giuliano, on the 25th June 1799, it fell into the power of the allied Austrian and Russian armies. It had been furiously bombarded during six days, and was about to be stormed when it surrendered by capitulation ; and so obstinate had been the resistance, that of 103 cannon found by the allies, only six were fit for use. After the decisive battle of Marengo, in 1800, Alessandria fell into the hands of the French, in whose possession it remained till 1814, when it once more changed masters, on the restoration of the king of Sardinia to his Italian states. During this interval it was the capital of the department of Marengo, and was greatly strengthened in its fortifications. Thirty-eight miles southwest of Milan, and forty-four miles east of Turin. Long. 8°. 40'. E. Lat. 44°. 57'. N.

ALESSIA, or **ALESSIO LISSUS**, a town of European Turkey, in the province of Albania, seated near the mouth of the Drino, forty miles west of Albanopolis. It is famous for the castle, where Scanderberg died, and was buried in 1467, for whom the Turks have such a veneration, that they carry away pieces of his tomb as relics, and esteem them effectual charms to animate their courage in battle. Lon. 19°. 36'. Lat. 42°. 8' N.

ALESSIO, a town of Turkish Dalmatia, in

Hungary, seated on a mountain, twenty-five miles from Spalatio. It is a bishop's see.

A L'ETENDARD, in music, to the standard! a military signal sounded by the trumpet, for the troops to gather round the standard, on the attack of an enemy.

ALETHA, a town of France, seated on the river, and in the department of Aude, arrondissement of Limouse, thirty-five miles south of Car-

cassone, and thirty-seven miles south-west of Narbonne. It is remarkable for its baths, and for the grains of gold and silver found in a stream which runs from the Pyrenean mountains, at the foot of which it stands.

ALEUROMANCY, from *αλεύρον*, meal, and *μαντεία*, divination, otherwise called alphitomantia, and crithomantia, an ancient kind of divination performed by meal or flour.

ALEUTIAN ISLES.

ALEUTIAN, ALEUTSKIE, or ALEUTIC ISLANDS, of *aleut*, a bold rock, a name given, principally by Russian navigators, to a chain of islands, extending from the promontory of Alaschka, in North America, to Kamtschatka, in Asiatic Russia. They are between forty and fifty in number, and include what were generally known in our English geographical works by the name of the Fox islands, Behring's and Copper islands, and the group formerly divided into the Aleutian and Andrenovian Isles. Behring's and Copper islands are still excluded from this denomination by some writers, but as the entire chain is evidently connected, and as they appear to be but a continuation of the immense mountains of the neighbouring continents, we shall find it most convenient, in common with the most recent Russian geographers, to consider them under this one appellation. In this extended view of them, these islands are scattered over that portion of the Northern Pacific, nearly 1500 leagues in circuit, communicating with the Northern ocean by Behring's straits. All the settlements hitherto formed upon them belong to Russia, and to that nation must be attributed the honour of their first discovery.

In the year 1725, Peter the Great, whose mind was strongly excited by the question then agitated, relative to the distance between the American and Asiatic continents, drew up instructions with his own hand, for the conduct of an expedition of discovery to this region, which was to be entrusted to the command of an officer named Behring. In 1728, the deputation sailed from the mouth of the Kamtschatka river, and coasted the eastern shore of Siberia as far as 67°. 18'. north latitude; but making no discovery of the opposite continent, in 1729 he again reiterated his attempt, but with no better success. The same illustrious officer, deputed in 1741 by the empress Anna, and attended by another vessel under the command of Tschirikoff, not only accomplished the primary object of his mission, but led the way to all the subsequent important discoveries of the Russians in these seas. His discoveries in the course of the voyage, aided by the recent conquest of Kamtschatka, have facilitated the solution of some of the most interesting problems of modern geography. Tschirikoff is said to have discovered the coast of America in the 56th degree of latitude; and Behring, who was separated from his companion in a storm, saw it in latitude 58°. 28'; and in his return was driven upon the island which now bears his name, and where he died.

The two uninhabited islands, Behring's and Copper island, appear to have been first visited in 1745; and becoming known to the natives of Kamtschatka, were largely resorted to for the sake of the valuable furs which they afforded. The Eudokia, in the year above alluded to, was fitted out by private adventurers, and the command given to Michael Nevodtsikof, a native of Tobolsk. Other adventurers penetrated as far east as the Fox Islands. One of the most remarkable of these voyages was that of St. Andrew and Natalia, fitted out by the merchant Andrean Tolstyk, which sailed from the Kamtschatka river on the 27th September, 1760, and reached Behring's Island on the 29th. Driven ashore by a violent autumnal storm, they were obliged to pass the winter; but putting to sea on the 24th of June the following year, they passed by Copper Island, 150 versts from the former, and steered south-east to the Aleutian Isles. These they reached on the 6th of August, and thence proceeded on the 19th, in quest of more distant islands, for the purpose, if possible, of exacting tribute. Steering away to the north-east, and north-east by east, they were driven by a gale of wind upon an island indented by a safe bay, where they anchored in safety. This they called Ayagh, or Kayaka, and another, about twenty versts distant, Kanaga. Four other islands were afterwards discovered. This group, north-west of the Fox Islands, were, in honour of the vessel which made the discovery, called the Andrenofskie, or Andrenovian Isles. From the year 1758 to 1760, though several vessels visited the Fox Islands, and obtained valuable cargoes of sea-otter and fox skins, little information was obtained. In 1762, four vessels sailed from the Fox Islands, of which only one returned, and the natives seemed exceedingly hostile.

For the better discovery of this archipelago, Captain Krenitzin and lieutenant Levashev sailed from the mouth of the Kamtschatka river, by order of the empress Catharine, to examine the chain of Aleutian Islands. Having carefully surveyed the whole of this archipelago from Behring's island to the promontory of Alaska, and after spending the winter in the Fox Islands, this expedition, in the autumn of 1769, returned to Kamtschatka. But our immortal Captain Cook communicated more scientific information respecting these islands, and also of the coasts of the two continents, than all the previous voyages of the Russians put together. During his third and last voyage in 1778, he surveyed the eastern portion of this

archipelago with his usual energy and perseverance, and enriched the science of geography with many new discoveries.

In the year 1785, the Russians instituted a fresh expedition, under the command of Captain Billings, an English naval officer, in the Russian service, who had accompanied Captain Cook in his last voyage to the Pacific Ocean. This attempt is ascribed to the suggestion of Mr. Coxe, then at St. Petersburgh, and whose account of the Russian discoveries between Asia and America, had attracted the attention of the Russian government. During this voyage, which was not completed till 1796, the whole chain of the Aleutian Isles was explored; and some parts of the western coast of America. The details are published in the narratives of Martin Sauer, secretary to Captain Billings, and Admiral Sarytchef. A few years after the return of this expedition, the Russian American Company turned their attention towards the best means of supplying the north-west American settlements with provisions, &c. It was resolved to try whether the conveyance by sea would not answer a better purpose, than the tedious journey by land to Ochotsk. To ascertain the practicability of this hypothesis, Captain Krusenstern, who had long served in the British Navy, suggested the plan of an expedition from Cronstadt, round Cape Horn, to the Aleutian Islands, and the north-west coast of America. This plan meeting the approbation of count Romanzof, the minister of commerce, and Admiral Mordwinof, minister of the marine, obtained the sanction of his imperial majesty; and two vessels called the Nadeshda and the Neva, were accordingly purchased in London for the voyage. The command of the expedition devolved on Captain Krusenstern, the original author of the plan, subordinate to whom, Captain Lisiansky was appointed to the Neva. These two vessels sailed in company from Cronstadt in the month of August, 1803, and proceeded to the Brazils, whence they sailed round Cape Horn to the Sandwich Islands where they separated; the Nadeshda proceeded to Japan and China, while Captain Lisiansky, in the Neva, proceeded to Kadyak and the American settlements. Upon the details of this voyage our limits do not allow us to enter, but full and interesting accounts have been published by the two captains, and also by Dr. Langsdorff, who went out in the expedition in the quality of a physician.

The westerly part of the Aleutian chain consists of those islands which lie nearest to Kamtschatka. The first is Commodore's, or Behring's Island, situate, according to Captain Cook, in fifty-five degrees of latitude, and sixty of longitude from the harbour of Petropaulowska, in the bay of Awatska. It is from seventy to eighty versts long, and stretches from north-west to south-east. Ten leagues from the south-east point of this island, in the direction of east by south or east-south-east lies Mednoi Ostroff, or Copper island, so called for the large masses of native copper found upon the beach. Still further to the east lie three small islands, Attak or Attoo, Semitshi, and Agattoo, the Plishnie Ostrova, or nearest Aleutian Isles of the Rus-

sians. These islands are situated between the fifty-fourth and fifty-fifth degrees of north latitude. Attak is the largest; nearly of the same shape as Behring's Island, but more extensive, stretching from east to west, to the length of eighteen leagues. It has two harbours, one of which lies on the southern coast. From the eastern extremity of the Aleutian Islands, properly so called, another group runs south-eastward, continuing the chain as far as the western extremity of the Fox Islands. These are called the Andreanofskie Islands; but we have less accurate information respecting the central part of the chain, than of the eastern and western groups. They are said to lie within the fifty-second and fifty-fourth degrees of north latitude, but being of inconsiderable extent and importance, are seldom visited by navigators. The most remarkable are, Takavangia, which has in its centre, near the northern coast, a burning mountain; Kanaghi or Kanaga, which has likewise a high smoking mountain; Ayag, which has a number of good bays and anchoring-places; and Tshetchina, on which a high white mountain overtops the rest, apparently an extinct volcano, especially as there are still hot springs on the island. Atshak, or Atchka, and Amlac, are also usually reckoned among the number of the Andrenovian isles, of which the former greatly resembles Copper Island, and is provided with a commodious harbour.

The most important and best explored portion of this archipelago is the easterly group, called by the Russians Lyssie Ostrova, or the Fox Islands. Of these the most considerable are, Umnak, Unalashka, or Oonalashka, and Unimak; the last of which is separated by a narrow strait from the promontory of Alaska. Beyond these, to the north-east, lies the large island of Kadyak, or Kodiak, generally included in the group called Schumagin's Islands.

The whole of these islands are bare and mountainous; their coasts are rocky and surrounded by breakers, which render their circumnavigation exceedingly dangerous. The land rises immediately from the coasts to steep bald mountains, towering above each other higher and higher, and assuming the appearance of chains of mountains, with a lengthwise direction of the island. Springs take their rise at the bottom of the mountains, and either flow in broad and rapid streams into the neighbouring sea, or, collecting in the rocky vales and glens, form ample lakes, sending off their superfluous waters, by natural canals, into the adjacent bays. They bear evident marks of volcanic formation; and several of them have still active volcanoes, which continually emit smoke, and sometimes flames. No traces of metals have been discovered on these islands; but carneoles and sardonyxes are common. Their soil is similar to that of Kamtschatka; and affords the same kinds of edible berries and roots; some few vegetables, however, seem to be of foreign origin. No wood of any considerable growth has been perceived upon any of these islands, except a small quantity on Unalashka. The land animals are bears, wolves, river-otters, river-beavers, and ermines. The sea-otter, so valuable on account of its skin, is

frequently caught; but the number of these animals, is much diminished. The Fox Islands furnish a great variety of foxes, of various colours, black, grey, red, and brown. The sea abounds with all sorts of seals, dolphins, and whales, and occasionally sea-lions and porpoises are seen. Salmon are caught in great abundance and variety; and halibut of an immense size are frequently taken. The winter upon these islands is mild, but the summer is equally short and unpleasant. The inhabitants are numerous, and tributary to Russia, from whence vessels are sent out, and establishments formed upon these islands on account of the very profitable chase of sea-otters and foxes for the supply of trade,

Unalashka, one of the largest of the Fox Islands, as visited by Captain Cook during his last voyage, merits more particular attention. This island stretches from north-east to south-west, and is from seventy to eighty versts in length, but of very unequal breadth. On the north and north-east side there are many bays and creeks, in some of which are convenient harbours. A part of the south-west shore consists of very high, steep, inaccessible cliffs; and another part has remained hitherto wholly unexplored. The whole island consists of a mass of rocks, covered with a thin coat of earth; the hills are of very unequal height, and are intersected by irregular valleys, the soil of which is commonly argillaceous, or an earth washed down from the hills. In the lower valleys there is abundance of grass, and Captain Cook was of opinion that cattle might subsist at Unalashka all the year round, without being housed. The soil, in many places, appeared capable of producing grain, esculent roots, and vegetables. Wood is unknown on this and the neighbouring islands, but low bushes and shrubs of dwarf-birch, willow, and alder, are common. For all the timber used for the purposes of building, &c. they are indebted to the sea, which wafts it to their shores from the continent of America. The inhabitants are rather low of stature, but plump and well shaped; with short necks, swarthy chubby faces, black eyes, small beards, and long, straight, black hair, which the men wear loose behind, and cut before, but the women tie up in a large fold. With regard to their character, Captain Cook describes them as the most inoffensive people he ever met with, and perfect patterns of honesty. But, according to the accounts of the first discoverers, this does not seem to have been their original disposition; and recent travellers have observed, that although generally kind-hearted and peaceable, yet, when roused to anger, they become exceedingly malevolent, indifferent to all danger, and even to death itself. The clothing of the men and women is nearly the same, and consists of a sort of frock or shirt, called parka, fastened round the neck with a broad stiff collar, and descending below the knee. These garments are made of the skins of seals, prepared in a manner peculiar to themselves, and sewed together very ingeniously. Though simple in their form, they are ornamented in a variety of ways with glass beads, beaks of sea parrots, long white goats' hair, brought from Siberia, or small red feathers. Over the frock, the men sometimes wear a kam-

leika, or rain-garment. This is made of gut, which is water-proof; and has a hood to it, which draws over the head, and is tied under the chin. When on shore, the men wear boots, made of seal's skin; and they all have a kind of oval snouted cap, made of wood, with a rim to admit the head. These caps are dyed with green and other colours, and are fancifully ornamented with ivory figures, carved from the teeth of the sea-cow, with glass or amber beads, and with the bristles from the beard of the sea-lion. They make use of no paint; tattooing was formerly very much in use among them, particularly among the women; but their intercourse with the Russians has rather brought this practice into disrepute. Both men and women, particularly the latter, bore the under lip, and insert pieces of bone or other ornaments; but this practice has also decreased of late. The women generally go barefooted; wear bracelets of glass beads just above the wrist and ankle-joints, and are fond of rings upon their fingers. The principal food of these islanders consist of fish, sea-animals, birds, roots, and berries. They dry large quantities of fish in summer, which they lay up in small huts for the winter. Roots and berries are also preserved for the same season. Of fish, the most common and abundant are several sorts of salmon, cod, herrings, and halibut. The last is the most esteemed, and is sometimes caught of an enormous size. The fat of the whale is also a favourite species of food; and when it grows old and rancid, serves to light and warm their houses. They eat almost every thing raw; but of late, have learnt from the Russians some simple modes of cookery. Vegetable food is not held in much esteem by the Unalashkans. That sweet plant, the Siberian parsnip, (*heracleum Sibericum*), is but little eaten, any more than the bulb of the saranna, or Kamtschadale lily. Edible berries abound; as Bramble-berries, cran-berries, huckle-berries, heath-berries, and others. The Russians have begun to plant potatoes, which succeed extremely well, and are much liked by the people. The habitations of the Unalashkans are holes dug in the earth, covered with a wooden roof, over which they throw grass and earth; so that a village has the appearance of an European church-yard full of graves. The entrance into these huts is from the roof; but some of the largest which are inhabited by the Russians, have a door in the side. Light is also admitted by the roof, through an opening or window, covered with seal's entrails, or dried fish-skin. Several divisions are made within, by means of seal-skins or straw-mats, which separate the apartments of the different families. Their household furniture consists of bowls, spoons, buckets, piggins or cans, matted baskets, and perhaps a Russian kettle. The knife and the hatchet, (or rather a small flat piece of iron, made like an adze, by fitting it into a crooked wooden handle, are the only iron tools found amongst them. Their instruments and utensils are, however made with the greatest neatness, and the most exact symmetry. The needles, with which they sew their clothes and embroider, are made of the wing-bone of the gull, with a very nice cut, round

the thicker end, instead of an eye, to which they tie the thread so skilfully, that it follows the needle without any obstruction. Their thread is made of the sinews of the seal, the fibres of which they split, to the thickness which each sort of work requires. The women are the tailors, shoemakers, and boat-builders, or boat-coverers. At their leisure hours, particularly in long winter evenings, they make fine mats, little baskets, and pocket-books of straw, that are both beautiful and strong. Captain Cook observes, there is a neatness and perfection in most of their work, that shows they neither want ingenuity nor perseverance. Their houses have no fire-place, but are both heated and lighted by lamps. These are made of a flat stone, hollowed on one side like a plate; in the hollow part they put the oil, mixed with a little dry grass, which serves the purpose of a wick. They produce fire both by collision and attrition; the former by striking two stones one against another, one of them being previously rubbed with brimstone. The latter with two pieces of wood, one of which is a pointed stick, and the other a flat piece. The pointed end of the stick they press upon the other, and whirling it nimbly round as a drill, in a few minutes it produces fire.

The principal occupations of the Aleutians, are fishing, hunting, and preparing the necessary implements for both. Their baidars, baidarkas, or boats, resemble the canoes of other savages, and consist of a skeleton of wood, over which is stretched a leather covering of seal's skins. The boats of the Unalashkans are superior in point of beauty to those of any of the other islands; some of them appear so transparent, that one might trace the formation of the inside, and the position of the rower. In their form, they are long and narrow, and commonly hold only one person; sometimes they are made to hold two, and occasionally three; each person sitting in a round hole just fitted to the size of the body. The whole canoe is so light, that, even when sodden with water, it may be carried in one hand, and is impelled by means of double paddles, seven or eight feet long, which are managed with great dexterity. Experienced navigators sometimes venture out, in these boats, a considerable way to sea, even in stormy weather. The darts, or javelins, with which they kill their game, are adapted with the greatest judgment to the different objects of the chase. For land animals a single barbed point; for birds, three points of light bone, spread, and barbed; for seals, &c. a false point, inserted in a socket at the end of the dart, which parts, on the least effort of the animal to dive, remaining in its body. To this barbed point, a string of considerable length is fastened, and twisted round the wooden part of the javelin. This serves as a float to direct them to the seal, which, having the stick to drag after it, tires, and soon becomes an easy prey. These darts are not shot from a bow, but slung from a small plank, about eighteen inches long and two inches broad. In order that the weapon may be held the faster, they have a sort of handle at the lower end, and an opening through which the fore-finger is thrust. At the other end is a small channel, into which the javelin fits with a little knob, which

serves to retain it. When the javelin is to be thrown, the plank is held horizontally, and the aim being taken, the weapon is directed by the middle finger and thumb. This is done with so much dexterity, and the motion given to it is so powerful, that the object aimed at is rarely missed, and even whales are thus killed without any other weapon.

Their favourite amusement is dancing, in which, however, they do not excel. Their music is exceedingly rude, consisting of a small drum or tambour, and a rattle made of the bladder of a sea-dog, filled with peas or small pebbles.—These little drums, however, are frequently ornamented with ingenuity and elegance. They also cut out from the teeth of the sea-cow, small figures of men, fish, sea-otters, and other objects, in a manner that appears very extraordinary, considering that the sea-cow's teeth are much harder than ivory, and that they have no proper tools to work with.

The religion of these Islanders, consists in superstitious observances, and a belief in charms. Many of them have been baptized, and are nominally professors of the Greek faith; of which, however, they understand nothing more than making the sign of the cross. They have no marriage ceremony; every man may have as many wives as he can conveniently maintain; if his means decrease, he sends first one, then another, back to their parents; and the women thus dismissed, look out for other husbands. Sometimes the same woman lives with two husbands; and it is not uncommon for men to sell or exchange wives. Boys, if they happen to be very handsome, are often brought up entirely in the manner of girls; instructed in the arts of female blandishment; and used as concubines. This shocking, unnatural, and immoral practice, has prevailed here even from the remotest times. Such men are known under the name of schopans. The bodies of the dead, especially of the men, were formerly interred in places set apart for the purpose, and with particular ceremonies. Their best javelins and clothes, with a portion of train-oil and other articles of food, were laid with them in the grave; and sometimes even slaves of both sexes were slaughtered upon the occasion. These customs are now, however, entirely laid aside.

The population of Unalashka, and the neighbouring islands, appears to have been formerly considerable, amounting to several thousands.—In 1790, Sarytchew reckoned it at 1300. According to the most recent accounts, it does not appear to amount to more than 300. This rapid depopulation is ascribed partly to the practice of sending the best hunters from hence to a distance, to chace the large sea-otters, few of whom ever return again to their families; and partly to the state of oppression under which the natives live, and the change which has taken place in their modes of living. Captain Cook seems to consider the natives of these Islands as originally of the same extraction with the Greenlanders and Esquimaux. When first discovered by the Russians, they were under the government of Toigans, or chiefs, who, however, possessed little distinction or dignity, and had no revenue. A

present they are subject to the Russian settlers. Throughout the whole of the Aleutian Islands, on the island of Kadyak, and the western coast of America, the Russians have formed settlements for the purpose of hunting, and collecting furs; with which they carry on a lucrative commerce, particularly with the Chinese. The most valuable fur is that of the sea-otter. Besides the sea-otter, there are a number of foxes, especially on the Fox Islands. The black foxes are not so valuable as those of Siberia. The arctic, or ice-fox, also called the rock fox, and the blue fox, from the natural colour of the fur, which is of a bluish-grey, is very common. From the first discovery of these islands by Behring and Tschereikoff, in 1741, the fur-trade was carried on for a long period by private adventurers; and appears to have been productive of great abuses. The natives were frequently treated in the most barbarous manner; and the keenness displayed by these rapacious hunters, threatened to extirpate the race of animals upon which the trade depended. Convinced of the extreme necessity of putting a stop to this destructive plan of proceeding, Schelikoff, an intelligent Russian merchant, took considerable pains to unite the different partakers of this trade into a company, in order that it might be conducted upon some plan that might prove advantageous to all parties. In 1785, he succeeded in joining company with the Golikoffs. They increased their capital, and fitted out several ships which the enterprising Schelikoff commanded in person. Factories, protected by forts, were established in almost all the islands, as far eastward as Kadyak; and for several years they continued a lucrative trade, and acquired considerable wealth. The success of this connexion induced several merchants to unite like Schelikoff and the Golikoffs; and, in this manner, was laid the foundation of the present Russian American Company. The irregular manner in which the trade was still carried on, and the cruelty which was frequently exercised towards the natives of the islands, drew upon them great censure: inso-

much, that the Emperor Paul determined to put an end both to the company and the trade. This determination would have been infallibly carried into effect, but for the interference of M. Von Resanoff, who had married Schelikoff's daughter, and was personally interested in the continuance of the American company. By means of his active interposition, the new established company was, in 1799, confirmed, with considerable privileges. The late Emperor, on his accession, interested himself very much in behalf of the company, of which he became a member, and induced many of the nobility to follow his example. By means of the active superintendence of the minister, count Romanzoff, and the commercial counsellor Benedict Cramer, this branch of Russian commerce has undergone several advantageous changes; but, according to recent accounts, many abuses still remain. The miserable situation of the Promischleniks, or fur collectors, themselves the slaves of the company's agents, and exercising, in their turn, the most oppressive tyranny over the wretched Aleutians, has been represented by several eye-witnesses in the most deplorable colours. It is to be hoped, that their situation may attract the attention of the Russian government. Notwithstanding the cruelties inflicted on them, these people are said to be very hospitable in their dispositions, and to receive their friends with some peculiar marks of respect. Attired in their best apparel, they go out beating drums to the shore, and the host and hostess rush out into the sea as high as their breasts, and draw the canoe towards the land. They then assist the guests to disembark, and bear them on their backs to the place of reception. The host tastes every thing before he presents it to the company; and after the feast they retire to their favourite amusement.—Müller's *Sammlung Russischer Geschichte.* v. iii. ALETRIS, from *ἀλετρυν* or *ἀλεω*, to grind, in botany, a genus of the hexandria monogynia class and order, of the natural order of lilia or liliaceæ, the coronariae of Linnaeus and asphodeli of Jussieu. Its characters are, no calyx; cor. one-petalled, ovate-oblong, hexangular, funnel-shaped, semisexfid very much wrinkled, divisions lanceolate, acuminate, spreading, erect, and permanent; STAM. awl-shaped filaments of the length of the corolla, inserted into the base of the divisions, anthera oblong and erect; PIST. an ovate germ: STYLE subulate, of the length of the stamens, STIG. trifid; PERICARP. an ovate, three-cornered, acuthinate, three-celled capsule; and the seeds are very many. Professor Martyn enumerates eight, and Gmelin nine species, viz. 1. A. farinosa, American aletris, stemless, leaves lanceolate, membranaceous, flowers alternate, growing in North America, was cultivated here in 1768, by Mr. Miller. The natives frequently use it as a beechie and incisive in coughs and in the pleurisy. 2. A. Capensis, waved-leaved aletris velheimia of Gleditsch, stemless, leaves lanceolate,

waved, spike ovate, flowers nodding; natives of the Cape of Good Hope, flowering here from November to April, and brought over in 1768, by Mr. W. Malcolm. 3. A. glauca, stemless, leaves lanceolate glaucous, flowers, nodding with a spreading border; a native of the Cape of Good Hope, flowering in January, and introduced in 1781, by Mr. J. Wynch. 4. A. uvaria, aloe uvaria of others, great orange-flowered A. stemless, scape longer than the sword-shaped keeled leaves; a native of the Cape of Good Hope, cultivated at Chelsea in 1707, and flowering in August and September in large spikes. There is a variety with narrower leaves, and longer spikes of flowers. 5. A. pumila, small orange-flowered A. stemless, scape shorter than the linear, sharply-heeled leaves; a native of the Cape, introduced in 1774, and flowering from September to November. 6. A. hyacinthoides, stemless, leaves lanceolate fleshy, flowers germinate; having two varieties. 7. A. fragrans, sweet-scented aletris, caulescent, leaves lanceolate, loose; found in Africa, and cultivated in 1768

by Mr. Miller. 8. *A. cochinchensis*, caulescent, leaves lanceolate-linear, reflex, flowers panicled; a native of Cochin China, the juice of the leaves is used to dye green, and the flowers are eaten. The eighth species of Gmelin is *A. japonica*, stemless, with leaves petiolated, ovate, lanceolated, seven-nerved, and spiked flowers. The ninth species is *A. aurea*.

ALEURITES, Αλευρίτης, farinaceous, of *αλεύρος*, meal, parts of the tree having a meal scattered over them; in botany, a genus of the monœcia monadelphia class and order, of the natural order of tricoccæ and euphorbiæ of Jussieu, the characters of which are, that the flowers are male and female; cal. of the male is a PERIANTH, three cleft, very short, clefts oval, and obtuse, cor. has five petals, oblong, spreading, obtuse: much longer than the calyx; the nectary has five scales somewhat cornered, very short at the bases of the petals: STAM. numerous filaments, connate into a conic columnar receptacle; anthere, roundish. The female flowers are few, in the same corymb; the calyx, corolla, and nectarium, as in the male, but larger; the pistillum has a germ conic superior; the style none, the stigmas two, very short; the pericarpium a large, globose, two-seeded berry; the seeds are two, globose, coated with a double bark. There is one species, viz. *A. triloba*, which is a tree of the islands of the South Sea.

ALEWIFE Fish, clupea tyranus. Among the different species of fish that resort to York River, in Virginia, about the month of March, the alewife or oldwife, called the bay alewife (*clupea non descripta*) arrives in very considerable shoals, and in some seasons their number is almost incredible: they are of the size of a large herring, and are principally distinguished from that fish by a bay or red spot above the gill-fin. When caught from March to May, full roed and fat, they are as good for the table as the herring. In this season, each of the fish has in its mouth

an insect, fixed with its back downwards, and firmly holding itself by its sixteen legs to the palate of the fish: it is two inches long, and called by the fishermen the louse: it is with difficulty that it can be separated, and perhaps never without injury to the jaws of the fish, though that may be from the hasty awkwardness of the fishermen; from which circumstance, it is, among the many superstitions current with that class of men, considered essential to the life of the fish: for when it is taken out, the fish, though returned to the river, is incapable of swimming, and soon dies. But as this is the case with every fish on whose mouth or gills any force has been used by heedless fishermen, such as the extracting a hook or drawing out an insect, we must attribute its death more to the injury received than to the loss of its companion. It is as yet uncertain whether the latter obtains its post by force or favour; whether it is a mere traveller or a constant resident, or what may be its business where it is found. There are some other particulars with regard to the natural history of this fish and its insect, which it may not be uninteresting to mention. The alewife comes from the ocean into the rivers of Virginia about the same time with the chad, and travels upwards from the beginning of March to the middle of May. As long as they are caught on their passage up the river they are full of roe; and every fish has the insect clasped to its mouth. A respectable gentleman who amused himself with fishing forty years, has declared, that in all that time he never saw a bay alewife without the louse. The chad returns from the fresh water lean, and out of season, about the end of May or beginning of June, and continues descending during the remaining summer months: no one then values it, being unfit for use. Whether the bay alewife returns with the chad is not known, for after June the fishing for them is discontinued.

ALEXANDER.

ALEXANDER, (king of Macedon,) surnamed the **GREAT**, was the son of Philip of Macedon, by his wife Olympias, daughter of Neoptolemus king of Epirus. He was born, according to the most authentic accounts, in the 106th Olympiad, B. C. 356, in the month Boedromion, and the night the temple at Ephesus was burnt. Alexander was contemporary, in his youth, with some of the greatest men in Greece, and had the happiness to be placed under the care of Aristotle as his *tutor*, who became deservedly his friend. 'I am indebted,' he once observed, 'to Philip, my father, for living; to Aristotle for living well.' It is presumed that the poems of Homer contributed much to produce his passion for military glory, especially as the character of Achilles seems to have been selected by him for a model. While very young, he gave several proofs of manly skill and courage; one of which, the breaking in of his fiery courser, Bucephalus, which had mastered every other rider, is men-

tioned by all his biographers as an incident which convinced his father Philip of his unconquerable spirit. His progress in every kind of science was rapid, and corresponded to the natural talents which he possessed, and the distinguished attention and abilities of his tutor. He devoted himself with the greatest assiduity to the study of metaphysics, mathematics, and morals; and was no less solicitous to be a master of rhetoric both in the theory and practice of it. To his solicitude in this respect we owe Aristotle's treatise on rhetoric, which, with a jealous unworthy a great mind, he requested the author not to communicate to any but himself. He had also a taste for the arts in general; he knew their importance and utility; and music, painting, sculpture, and architecture, flourished in his reign, because they found in him a competent judge, and, as some say, a munificent protector. In early life he manifested a genius formed for great and splendid actions. When he conversed

with the Persian ambassadors at his father's court, at the age of no more than seven years, the subjects of his enquiry were, not the palaces and retinue of their king, but the character and manners of their sovereign, the number and discipline of his army, the road that led into upper Asia, and 'the number of days' march from Macedonia to Susa.' When he was requested to enter his name among the Olympic competitors, he replied, 'So I would, if I were to have kings for antagonists.' On the occasion before mentioned, of his taming the famous horse Bucephalus, which none of his father's grooms would venture to mount, Philip was so delighted that he said to him, 'My son, seek a kingdom more worthy of thee, for Macedon is below thy merit.' His youth is said to have been distinguished by temperance, chastity, and self-command.

His dutiful respect for his mother, whom Philip divorced, produced a disagreement between him and his father; and was increased by a suspicion, which was entertained, that he would be disinherited, in favour of one of Philip's children by another wife. When only sixteen years of age, he was appointed regent of Macedonia during his father's absence; on which occasion he manifested such prudence and bravery, that he was afterwards employed in several military enterprises, and is said to have once preserved the life of his father by his resolute and seasonable interposition. In the battle of Chæronea, at the age of eighteen, he signalized himself by his valour, and greatly contributed to the victory. Before Philip undertook his projected expedition into Asia, he recalled his son from Epirus, whither he and his mother had retired, and was apparently reconciled to him: but when his father was assassinated by Pausanias, Alexander and his mother were suspected of being privy to the conspiracy. The first act of his reign, however, was the just punishment of the murderers. In the twentieth year of his age, B.C. 336, he succeeded to the throne of Macedonia; and commenced his military career by marching into Thessaly to overawe the Greeks, who were disposed to emancipate themselves from the Macedonian yoke, and by causing Attalus, who encouraged their revolt, to be put to death. Having succeeded in this enterprize, he marched into Thrace, defeated the Triballi, who inhabited the modern Bulgaria, and drove them beyond the Danube; he also made the Getae to fly at his approach; subdued several barbarous nations, and established a treaty of peace, in which the Celtes, a fierce and high-spirited people, and others, were comprehended. During his absence in these expeditions, the cities of Greece, instigated by the eloquence and influence of Demosthenes, formed a powerful alliance against him. The report of his death had induced the Thebans to revolt; and, having murdered two officers of the Macedonian garrison, they were preparing to besiege the citadel. Alexander, receiving intelligence of this event, hastened to Greece, B.C. 335, passed the straits of Thermopylae, and entered Boeotia before the Thibans were undeceived as to his death. To those who accompanied him, he spoke in the following

manner: 'Demosthenes, in his orations, called me a child when I was in Illyria and among the Triballi; he called me a young man when I was in Thessaly; and I must now shew him, before the walls of Athens, that I am a man grown.' The city of Thebes, though bravely defended by the inhabitants, was at length taken by storm, the buildings were rased, the house of Pindar the poet excepted, from a respect to its owner; the inhabitants were sold for slaves, and the lands distributed among the soldiers; this conduct struck the Greek states with terror. Athens sent a deputation to Alexander, imploring his clemency; but he demanded the surrender of ten orators, whom he supposed to have been the chief instruments in forming the league which Philip his father had defeated at Chæronea. This was the occasion on which Demosthenes recited to the people the celebrated fable of the Wolves and the Dogs.

Alexander having relented, by the interference of Demades, and waved the enforcement of his demand, re-established the tranquillity of Greece, and went to Corinth, where his office of generalissimo was recognized and settled. At Ægea he held a grand council of state and war, in order to deliberate upon his expedition into Asia. Antipater and Parmenio recommended delay, but Alexander had formed his purpose; and having offered sacrifices, entertained his friends with feasts, and distributed among them the crownlands, Perdiccas asked him what he had reserved for himself? 'Hope,' replied Alexander. Accordingly he assembled his army, and prepared for his march into Asia. When one of his attendants asked him why he succeeded so well in quieting the dangerous tumults in Asia? he answered, 'It was by delaying nothing.' In the twenty-second year of his age, B.C. 334, Alexander crossed the Hellespont into Asia, with an army of about 30,000 foot, and 4000 or 5000 horse. Parmenio, who commanded the infantry, passed over with the greatest part of the army from Sestos to Abydos; and Alexander crossed first the Strymon, afterwards the Hebrus, and after twenty days march arrived at Sestos. Having prepared for his expedition by a variety of superstitious ceremonies, to which he was attached, he proceeded to Ilium, where he sacrificed to the heroes buried in the neighbourhood, and particularly to Achilles, to Minerva, and to the ghost of Priam. In his march he preserved Lampsacus, which he had determined to destroy, on account of its adherence to the Persians; and this he did in consequence of the interposition of Anaximenes. 'I swear solemnly,' says Alexander to Anaximenes, who met him on the road, and the object of whose interview he suspected, 'that I will not do what you desire me.' 'My request, then,' said the old man, smiling, 'is, that you would burn Lampsacus.' The Persians collected a large force to meet him on the banks of the river Granicus, May 22, B.C. 334; but after an obstinate resistance, they were routed with great slaughter. The consequence of this victory was the surrender of Sardis, the chief town of Lydia, and the possession of the whole country as far as the river Hermus. Our conqueror then proceeded to Ephesus, and restored

the democracy; and by an edict established the popular government in all the Greek cities. At Miletus, which he besieged and took, he dismissed his fleet, and advanced to the siege of Halicarnassus, which was abandoned by the Persians, and then to Tralles, which he took and levelled with the ground. Having demolished Halicarnassus, he appointed Ada, who claimed the title of queen of Caria, and who delivered up to him Alinda, governess-general of all Caria; which induced many of the princes of the Lesser Asia to revolt from the Persians, and to put themselves under his protection. Alexander ingratiated himself with the army, by permitting the soldiers who were married to spend the winter with their wives in Macedonia; a practice conformable to the law of Moses, Deut. xxiv. 5., and which Aristotle probably learnt of some Jew, and recommended to his pupil. Whilst the king was busily preparing for the next campaign, an unsuccessful attempt was made upon his life by the corruption and treachery of an officer of his army.

The campaign, however, was opened early in the spring; and Alexander, taking possession, in his march, of the cities of Lycia and Pamphylia, proceeded to Phrygia; and at Gordium, the capital, he was desirous of seeing the famous chariot to which the Gordian knot was tied. The oracle had foretold, according to an ancient tradition of the country, that the man who could untie it should possess the empire of Asia: Alexander, persuaded that this prediction related to himself, after many fruitless trials, exclaimed, 'It is no matter which way it be untied,' and cut it with his sword. Having subdued Paphlagonia and Cappadocia, he advanced by hasty marches into Cilicia, and arrived in the country called Cyrus's Camp. Through a narrow strait called the Pass of Cilicia, he marched with his army to Tarsus, where Parmenio arrived just in time to prevent its being set on fire by the Persians. Heated and fatigued by so rapid a march, he plunged into the river Cydnus, which ran through this city, and was instantly seized with a shivering, which his attendants thought would prove fatal. The whole army were alarmed, and they expressed their apprehensions with lamentations and tears; and as the speedy arrival of Darius was expected, Alexander intimated to his friends and physicians, that the condition of his affairs would not admit either of slow remedies or timid physicians. 'A speedy death,' says he, 'is more eligible than a slow cure.' Philip, an Acarnanian, one of his physicians, who tenderly loved him, offered to give him a dose, which would be speedy in its effects, and desired three days to prepare it. In the mean time Alexander received a letter from Parmenio, in Cappadocia, which bid him beware of Philip, Darius having bribed him by the promise of a thousand talents, and his sister in marriage. His confidence however, prevailed over his fears. He did not divulge the contents of the letter, but when Philip came to administer his medicine, he took it from under his bolster, and gave it Philip to read; and fixing his eyes on the physician, swallowed the draught without hesitation. The effects of the medicine were very violent, but the skill of

the physician prevailed, and Alexander in three days presented himself to the congratulations of the army.

During this interval Darius was on his march, and Alexander advanced to meet him near Issus, in the month of October, B. C. 333. The army of Darius consisted of 600,000 men; but by infatuated councils, and a vain confidence in the number of his forces, he had quitted an open and level country, and prepared to engage in a close and mountainous situation, where his multitude could only embarrass him in action. Victory was for some time obstinately disputed; and Alexander received a wound in his thigh; but at length the Persian emperor fled. A dreadful carnage succeeded, and the tent of Darius, with his mother, wife, and daughters, came into the possession of the conqueror. When Alexander had performed the offices of duty and compassion to the dead and wounded, he entered the tent where the queens were lodged, accompanied only by his favourite Hephaestion. The queens mistaking Hephaestion for the king, paid their respects to him as such; but as soon as Sysigambis, the mother of Darius, had discovered the mistake, she fell prostrate at the feet of Alexander, and begged his pardon. The king raised her from the ground, and said to her, 'Dear mother, you are not mistaken; he also is an Alexander.' Alexander, after this respectful visit, declined exposing himself to the danger of human frailty, and solemnly resolved never to see the queen of Darius any more.

After this victory, he pursued his march to Syria. Parmenio went to Damascus, and possessed himself of the treasures of Darius. The king proposed to visit Tyre, that he might have an opportunity of sacrificing to the Tyrian Hercules; but the Tyrians resolved not to admit a Macedonian within their gates. Alexander therefore determined to besiege the city; and this siege, one of the most famous in history, lasted for seven months, when the place was stormed and utterly destroyed. Thousands were put to the sword, two thousand were crucified, and the rest sold for slaves. After having depopulated the city, he colonized it anew, and boasted of being its founder. This event took place, August 20th, B. C. 332.

From Tyre Alexander proceeded to Jerusalem, with the intention of punishing the Jews for affording relief to the Tyrians during the siege; but on his approach he met Jaddua, the high priest, in his pontifical habit, accompanied by the priests in their sacred vestments, and the people clothed in white. When the procession drew near, Alexander bowed before the priest, and paid him religious adoration; alleging to Parmenio, as the reason of this conduct, that the figure of a person in such habit had appeared to him at Dium, in Macedonia, and assured him of the divine guidance, and of ultimate success in his expedition. After this interview, he is said to have accompanied Jaddua to Jerusalem, sacrificed in the temple, and conferred great favours on the Jewish nation. From Jerusalem he proceeded to Gaza, which he besieged, and took by storm: from Gaza he marched to Pelusium, left a garrison in it, and sailed up the Nile.

He afterwards marched through the deserts to Heliopolis, and, crossing the river, he arrived at Memphis, where he offered pompous sacrifices not only to the Grecian gods, but to the Egyptian Apis. From Memphis he sailed down the river to the sea, and fixed on the place where he proposed to build a new city, which has since become so famous under the name of Alexandria. Here he formed the design of visiting the temple of Jupiter Ammon, situate on an oasis in the midst of the Lybian deserts. The senior priest of this temple flattered him with the title of the son of Jupiter, which Alexander joyfully accepted; and he was farther assured that he should be the monarch of the world. From this journey, which had proved so successful, he returned as from a triumph; and afterwards in all his letters and decrees, used the following style: 'Alexander, king, son of Jupiter Ammon.'

Having, during his abode at Memphis, settled the affairs of Egypt, he marched in the spring towards the east against Darius. In his way to Tyre, which was the place appointed for the general rendezvous of his forces, he heard that Andromachus, whom he had appointed governor of Syria and Palestine, had been massacred at Samaria: and, in order to avenge this audacious act, he put those that were concerned in it to death, banished the rest from Samaria, supplied their place with a colony of Macedonians, and divided part of their territories among the Jews.

From Tyre he directed his march to Thapsacus, and having passed the Euphrates, was informed of the death of Statira, the captive queen of Darius; which detained him, till he had visited Sysigambis, administered suitable consolation, and performed the funeral obsequies of departed royalty in the most magnificent manner. Darius was much gratified by the tokens of respect which Alexander had rendered to his queen and family, and renewed propositions of peace. On a former occasion, during the siege of Tyre, he had made very advantageous proposals, which Parmenio wished him to accept; declaring, that he would agree to them if he were Alexander. 'And so would I,' replied Alexander, 'were I Parmenio.' Darius now offered him all the provinces between the Euphrates and the Hyrcanian: but Alexander had more extensive views, and Darius prepared for battle, pitching his camp near a village called Guagamela, in a plain at some distance from Arbela. Alexander, at the sight of his formidable army, consulted soothsayers, offered up victims to fear, joined in prayers addressed to Jupiter, Minerva, and Victory, and afterwards went to bed, and slept soundly the whole night. Parmenio expressed his surprise in the morning, that the king should be able to sleep so calmly, just as he was going to fight a battle in which his whole fortune was at stake:—'How could it be possible,' replied Alexander, 'for us not to be calm, since the enemy is coming to deliver himself into our hands?' The army of Darius consisted of 600,000 foot, and 40,000 horse; and, according to some historians, of upwards of a million of men, and that of Alexander of no more than 40,000 foot, and 7000 or 8000 horse. The Persians

were, however, totally routed: Parmenio, who was in great danger, was rescued by Alexander in person; and they both joined in the pursuit of Darius; and, passing the river Lycus, marched to Babylon, which Mazaeus, the governor, instantly surrendered. This battle of Arbela, fought in October, B. C. 331, decided the fate of Asia.

From Babylon Alexander marched towards Susa, where he found treasures of various kinds, and of great value. Here he left Darius's mother and children; and having reduced the Uxii, whose country lay near Susa, and extended to the frontiers of Persia, he forced his way through the Persian straits, and arrived at Persepolis. Having destroyed the royal palace, to which he and his companions, in a season of debauch, at the request of Thais (the courtesan, and Ptolemy's mistress,) set fire, and plundered the city, he pursued Darius first to Ecbatana, the capital of Media, and then as far as Rhages, a city one day's journey from the Caspian straits. His progress was however interrupted by the news of the death of this monarch, who was murdered by a conspiracy of his own subjects. Having settled the government of Parthia, he reduced Hyrcania, dispersed the Mardi, took possession of Zadracarta, the capital of Hyrcania, where for fifteen days he celebrated solemn games, and offered magnificent sacrifices to the gods of Greece, and then entered and proceeded to the reduction of Asia.

The luxury of the Persians produced in his army, not only faction and discontent, but even a conspiracy against the life of the king; Philotas, the son of Parmenio, was forced, by torture, on this occasion, to confess his guilt, and his condemnation was followed by the assassination of his father, at the age of seventy years. This alienated the affections of his army, and produced such a degree of dissatisfaction and disgust, that he separated those who were disposed to sedition from others, and proceeded without further delay to action. Having passed through Drangania, Arachosia, and the country of the Arimaspi, all which submitted to his arms, he arrived at part of Mount Caucasus, called Paropamisus, where his army endured much toil and hardship; and where Bessus, who had been a principal agent in procuring the death of Darius, and had assumed the imperial purple, under the title of Artaxerxes, had laid waste the country, in order to deprive him of provisions and forage. Alexander having found an opening that led into Media, directed a city to be built there, which he called Alexandria; and also founded several towns in its vicinity. From hence he penetrated into Bactria, and took Aornos and Bactra, the two strongest cities of the country: he then passed the river Oxus in pursuit of Bessus, who had withdrawn with a few adherents over this river to Nauticus, a city of Sogdiana. When Alexander arrived at a small city inhabited by the Branchidae, he committed an act of cruelty, which though omitted by Arrian, is related by Curtius, lib. vii. c. 5. tom. ii. p. 520, ed. Snakenb, and referred to by Strabo, lib. xiv. tom. ii. p. 787. Bessus, despoiled of all the ensigns of royalty, and stripped even of his garments, was brought in chain

before him, when he ordered his ears and nose to be cut off, and delivered him up to Oxyartes, the brother of Darius, by whom he was sent to Ecbatana, and, according to some, crucified. Plutarch relates, that being fastened by his limbs to trees which were bent together, he was torn asunder by their elastic force, when they were allowed to return to their natural position.

Our hero then pursued his march to Maracanda, the capital of Sogdiana, known by the name of Samarcand, and by long and dangerous stages advanced to the river Iaxartes, erroneously called by Arrian, Curtius, and others, Tanais. On the side of this river he was surprised by the barbarians, who, rushing suddenly from their lurking holes in the mountains, and fighting with bows and slings, killed many of the Macedonians, and took others prisoners. The king himself was wounded in the conflict; but the barbarians were at length defeated with great slaughter. Soon after this transaction he formed a treaty with the Abian Scythians, who, from the time of Cyrus, had lived in freedom and independence, and were distinguished by equality and liberty, love of poverty and justice. Whilst he was forming a plan for building a city on the river Iaxartes, in order to curb the nations he had already conquered, and those he intended to subdue, he was diverted from the execution of his design by the revolt of the Sogdians and Bactrians: and, directing his arms against their combined forces, he took and destroyed in a few days seven of their cities. The capture of Cyropolis, the most populous of the whole country, was vigorously resisted by the inhabitants; but it was razed to the very foundations. In these different sieges, Alexander, Craterus, and many of his principal officers were wounded. He then returned to the Iaxartes, marked a space of about three leagues in circumference, and built a city, called Alexandria. In less than twenty days the ramparts were raised, and the houses built; and, in order to people it, he ransomed all the prisoners he could find, settled in it several Macedonians, who were worn out in the service, and permitted many natives of the country, at their own request, to inhabit it. His conflict with the Scythians, was difficult, and he granted them a peace on their own terms. The Sacæ, a powerful nation, submitted to him, and, by an embassy, courted his favour.

Alexander was now gradually throwing off both the habit and manners of a Macedonian prince, and assuming those of an eastern despot. He was surrounded by a number of sycophants, the bane of princes, and the curse of nations, who, by indulging his humour and soothing his passions, precipitated him into extravagances, and deprived him of his former equanimity. One faithful friend, whose value was unknown, declined concurring in the general adulation. At a banquet which succeeded the sacrifices performed at a festival of Bacchus, the honour of which Alexander had transferred to the Dioscuri, i. e. to Castor and Pollux, some of the attendants extolled the actions of the Macedonian prince above those of Castor and Pollux, and even of Hercules. Clytus remonstrated, alleging, that 'he could not bear to hear such indignities

offered to the gods, or the credit of ancient heroes undervalued, to tickle the ears of a living prince.' As to Alexander's actions, he allowed they were great and glorious, but he maintained that they were not supernatural; that the army had shared in them, and that they had a right to participate in the praise belonging to them. Alexander was indignant; and, as Clytus affirmed that he had preserved the life of the king at the battle of the Granicus, stretching out his arm and saying, 'this hand, O Alexander, saved thee,' the king rushed upon him, and endeavoured to kill him, but was prevented by the interposition of friends. At length, however, when his friends retired, he seized a lance, or long Macedonian pike, and laid Clytus dead on the spot. His passion soon subsided, and, reflecting on the deed he had perpetrated, he indulged excessive grief, refused food for three days, neglected his apparel, and, as some say, would have slain himself with the same pike that killed Clytus. Flattered, however, by the army, and perverted by the doctrine of Anaxarchus, of Abdera, the sophist, who taught him, 'that let a sovereign prince do what he will, all his actions are just and lawful,' he soon became more tranquil. His servile attendants attempted to persuade him that he was more than man, and that it was unjust and disloyal in his subjects not to own his divinity; and some of them, amongst whom Anaxarchus was the chief, even endeavoured to engage the Greeks, as well as the Asiatics to pay him adoration. Alexander was pleased; and was highly provoked by a speech of Callisthenes, the disciple and relation of Aristotle, who attempted to awaken in his mind more sober thoughts; and it was determined that when the king drank to any guest, he should immediately arise, adore him, and having received a kiss from the king, depart from his divine presence.

These produced a new conspiracy against the king, but the conspirators being discovered, were stoned to death. Callisthenes was apprehended, and, as some say, carried about in chains, till he died a natural death; but according to others, he was first racked and then crucified. The death of Callisthenes, says Seneca, Nat. Quæst. lib. vi. c. 23, is an eternal reproach to Alexander, and a crime of so horrid a nature, that no quality, however excellent, nor military exploit, however illustrious, can ever efface its infamy.

After having surmounted his domestic dangers, he pushed his conquests into the countries north-east of Persia, and waged war with the Sogdian prince, Oxyartes. The only strong hold which the enemy could retain, was the Sogdian rock, or the rock of Oxus, into which Oxyartes had conveyed his wife and family. It was defended by Arimazes, with 30,000 soldiers under his command, and furnished with provisions for two years, and was deemed impregnable. Alexander, before he commenced the siege, summoned the garrison to submit, when the commander asked in return 'whether Alexander, who was able to do all things, could also fly; and whether nature, on a sudden, had given him wings?' Alexander was highly exasperated, and directing 300 mountainers in his army to seek a path to the top of the

rock; sent a message to the commander, summoning him to surrender, and informing him ‘that he had now a corps of winged soldiers.’ The Macedonian camp resounded with the shout of ‘victory,’ and the barbarians instantly surrendered. Implacable in his resentment, Alexander ordered Arimazes and the principal nobility of the country to be scourged with rods, and afterwards to be fixed to crosses at the foot of the rock. After the reduction of this place, he marched into the country of the Paratae, where was another fortress, called the rock of Chorianes, also deemed impregnable. Chorianes, the commander, was, however, induced by Oxyartes, to surrender it; and, having been enrolled in the number of Alexander’s friends, was entrusted with the charge of it, in return for which he supplied the Macedonians with provisions. On one of these occasions, Roxana, the daughter of Oxyartes, who, after the death of the wife of Darius, was esteemed the most beautiful woman in Asia, fell into the hands of the conqueror; and such was the influence of her charms, that he espoused her publicly.

India next attracted Alexander’s attention; and accordingly he dispatched a herald to Taxiles, and the other princes on this side the river Indus, enjoining their submission; and Hephaestion, with part of the army, was dispatched to join Taxiles and the rest of the Indian princes, who were come out to meet them, and to reduce the country as far as this river. This was speedily executed. Alexander bent his march towards the river Choaspes, and reduced several places in his progress, among which Andaca was one of the most considerable. He proceeded against the Aspii and Assaceni, whom he successively defeated; but having invested Magaza, the capital of the latter people, he was wounded in the siege, and repeatedly repulsed. The Indians were however compelled to submit; and by an act of perfidy, which Diodorus Siculus and Plutarch severely condemn, were all put to the sword. Ora, Bazira, and the rock of Aornus, to which the inhabitants of the latter place retired, were next reduced; and Alexander proceeded to the river Indus, where Hephaestion and Perdiccas had already provided a bridge of boats for the passage of the army. Having refreshed his troops in the territory of his ally, Taxiles, Alexander passed the Indus, B. C. 327, and advanced forward to the Hydaspes, known in modern times by the name of the Betah or Chelum, or, according to the orthography of Major Rennell, Behut, and Ihylum, where Porus, with a large army, lay encamped to dispute his passage. On approaching the banks of this river, he found that the people with whom he had to contend were not to be subdued so easily as the Persians. The Indians were a very tall, robust, hardy, and well disciplined people; and their king, Porus, a prince of high spirit and invincible courage. Alexander, however, after encountering great difficulties, on account of the inundations of the Indian rivers, at the time of his march, which was about the height of the rainy season, passed the Hydaspes; and, having vanquished a detachment under the command of the son of Porus, who was slain in the

action, encountered Porus himself at the of 4000 horse, 30,000 foot, 300 chariots, 200 (or as Q. Curtius says, lib. viii. 18.) 85 phants. The dispute was short and bloody. Indians were completely routed, and Porus compelled to submit. Alexander received king with respect. This prince being asked ‘how he wished to be treated?’ replied, a king. ‘That, for my own sake,’ said Alexander, ‘I shall do.’ ‘And therein,’ rejoined Porus, ‘is comprehended all that I can.’ Alexander gave him his liberty, and restored kingdom, with additional provinces; while Porus, in return, became his friend and a ally. Two cities were built; one called Nicæa, the other Bucephala, for perpetuating the remembrance of this victory. Passing the river Acesines, he entered the territories of another Porus, and in pursuit of him crossed the Hydراotes; and having conquered the kingdom, he gave it to his late ally. In the midst of this success, Alexander received advice, that the Cathe, Oxydrace, and Malli, the most warlike nations in India, were confederated against him, and had assembled a great army. He immediately proceeded to attack them; and, though they made a vigorous defence, they were put to flight; and their city of Sangala taken by storm and razed. He then prepared to pass the Hyphasis, as Arrian says, to seek new enemies. Here he was told, that after passing this river, he must travel eleven days through deserts, that he would then arrive at the Ganges, the largest river in India; and that farther in the country were the Gangaridae and Prasii, who were collecting a great force, in order to oppose his entering into their dominions. Rumours of this kind spreading through the army, produced discontent, which unable to allay, he was constrained to terminate his progress. When his purpose was made known to the army, he was saluted with loud acclamations, ‘because,’ they said, ‘he who was invincible had suffered himself to be overcome by their prayers.’ On the banks of the Hyphasis, the modern Beyah, which were the limits of his conquests, he caused to be erected twelve altars, on which sacrifices were offered. These altars, if we may believe the biographer of Apollonius Tyanaeus, were still remaining, with legible inscriptions, when that fantastic sophist visited India, 373 years after Alexander’s expedition.—*Philostrat. vita Apollon.* lib. ii. c. 43. ed. Olearii.

Having exhibited public shews in the Grecian manner, he added all the conquered country to the dominions of Porus, and began a retrograde march towards the river Hydراotes. From thence he proceeded to the Acesines, and marched on to the Hydaspes, proposing to embark on the river Indus, and to pass by this river to the ocean. Observing in these rivers many crocodiles, and seeing that the country produced beans like those of Egypt, he inferred, that he had discovered the source of the Nile, and prepared a fleet to sail down the Hydaspes to Egypt, Strabo. Geog. lib. xv. p. 1020. This circumstance shews, that the knowledge of the Greeks, in his age, did not extend beyond the limits of the Mediterranean. The breadth of the Panjab, as it

called, through which Alexander passed, Ludhana, on the Setlege, to Attock, on the Indus, is computed to be 259 geographical miles, a straight line; and his march, computed the same manner, did not exceed 200.

But in his advance and return, his troops so spread over the country, and all his movements were so exactly measured and delineated, by men of science, whom he kept for the purpose, that he acquired a very extensive knowledge of that part of India.

Having prepared a fleet, consisting of eighty vessels of three banks of oars, and about 2000 smaller ships and transports, and having offered sacrifices to the gods, he embarked, and at the sound of a trumpet the fleet began to move; but arriving at the confluence of the Acesines with the Hydaspes, where these united streams roll with great rapidity into the Indus, many of his vessels were lost, and he himself was in great danger. When the danger was past, and the fleet and army were joined, he began his march, through a desert country, in order to reduce the Malli and Oxydraca, whom he surprised before they could prepare for a contest. In storming their principal city, Alexander, in person, scaled the walls, and leaped down into the city, accompanied by only three of his guards. Here being wounded, he fainted through loss of blood; two of his guards, who were themselves wounded, however, covered him with their shields; till the soldiers from without, ascending the walls, threw themselves into the city, and by an act of the most undaunted resolution rescued their sovereign. As soon as he was able he rejoined his forces.

His first thoughts were now directed to the increase of his fleet; and, having accomplished this object, having given orders for erecting a city in the commodious situation afforded by the confluence of two great rivers, and having conferred upon Oxyartes, the father of his wife Roxana, the government of Paropanisus, with some additional territories, he embarked, and continued his voyage; occasionally employing himself, as he proceeded, in reducing some Indian princes, who were either negligent in attention, or took up arms against him. Of this number, were Musicanus, the sovereign of one of the richest and most populous kingdoms in India; Oxycanus, another Indian prince, who was taken prisoner; and Sambus, whose capital, Sindomana, opened its gates to receive him. Musicanus afterwards revolted; and Alexander directed him to be carried back into his own dominions, to be there crucified, together with all the brahmuns, who had instigated him to revolt. The king next sailed to Patala, the modern Tatta, an island formed by two branches of the river Indus, where he ordered an haven and convenient docks to be constructed for his ships; and when he had careened his fleet, he sailed down the right hand branch of the river towards the ocean. As they approached the sea, they were exposed to great danger for want of skilful pilots; and, therefore, after having gratified his vanity by entering the ocean beyond the Indus, performing religious rites in honour of Neptune, and surveying two small islands, he returned to Patala. Having sur-

veyed the other branch of the Indus, and found a place of safety for his fleet, he gave directions to Nearchus, to conduct the fleet, by the ocean, through the Persian gulf, up the river Tigris, to meet him and his army in Mesopotamia; and departed, with the army, to march back by land to Babylon. The distance of that place on the Hydaspes, where Alexander fitted out his fleet, from the ocean, according to the researches of Major Rennell, cannot be less than a thousand British miles, whence, considering the slow navigation of such a fleet as he conducted, it is no wonder that he was above nine months before he reached the ocean.

Having left Patala, Alexander crossed the Arabis, and marched through the country of the Oritæ, whose capital he seized, and converted into a new and noble city, which he committed to the government of Hephaestion. He then proceeded through Gedrosia; and, in the whole of his progress, suffered much from sickness, excessive heat, and fatigue, and also from famine and thirst; so that he brought back from India scarcely one fourth of his army, which had consisted of 120,000 foot, and 15,000 horse. In these circumstances, he maintained an invincible resolution; and, by his example, encouraged the perseverance of his troops. Having rested and refreshed his army at the capital of Gedrossia, he prepared his march into Caramania, a very plentiful country, where his attendants were amply recompensed for the hardships and fatigues they had endured. Here he punished those governors who were charged with mal-administration, some of whom were put to death; and redressed the various grievances which the people had suffered in his absence. He then continued his march through Caramania, and was joined by Nearchus, his admiral; and, turning aside to Persia, he visited the tomb of Cyrus, at Pasargadæ; ordered Orsines, the governor of Persia, who was charged with many atrocious crimes, to be crucified; placed Peucetas, who had saved his life in a city of the Malli, in his room; and commanded Baryaxes, a Mede, who had usurped the title and tiara of king, to be put to death. In these marches, Calanus, an Indian brahmun, who had accompanied Alexander, finding his health declining, requested to have a funeral pile prepared; on the top of which he stretched himself at full length, and remained without voice or motion in the midst of the flames.

At Susa, to which Alexander next marched, he put to death Abulites, and his son Ozathres, who were charged with enormous crimes in the administration of public affairs; and, to unite the Macedonians and Persians, he encouraged the forming alliances between the noblest families of Persia and the principal persons of his own court; and by taking himself two wives of the royal blood of Persia, viz. Statira, the daughter of Darius, and Parysatis, the daughter of Ochus, set the example. He also bestowed fortunes on those Persian ladies of high rank, who were married to his own principal officers. Here, also, he paid the debts of his army, and conferred rewards and promotions on those who had signalized themselves in his service.

Having still a curiosity to see the ocean, and to explore the maritime parts of his empire, he went down from Susa, upon the river Eulaeus; and having crossed the Persian gulf to the mouth of the Tigris, went up that river to the army, which was previously encamped, under the command of Hephaestion, on its banks, near the city of Opis. Here he issued an edict, that those Macedonians, who were either unable, or unwilling, to make any more campaigns, might have their discharge, and return home; and that those who chose to remain with him, should be duly encouraged. This edict, which was intended to please the army, excited a mutiny, which was quelled by extraordinary resolution and intrepidity. Whilst the soldiers surrounded the tribunal on which he was seated, all clamouring for their discharge, reproaching him with the favours which he had conferred on the Barbarians, and insolently telling him, that his father Ammon and he might go and subdue the world by themselves, he leaped into the midst of them, ordered his guards to seize thirteen of the ringleaders, whom he pointed out, and commanded their immediate execution. This terrified them into silence; immediately upon which, remounting his tribunal, he pointed out to them, in an eloquent speech, the justice of his own conduct and the folly of theirs. He afterwards promoted the Persian nobility to the principal commands in his army; and by thus seeming to transfer his confidence, humbled the Macedonians, who delivered up the authors of the sedition on condition of reconciliation and favour.

At Ecbatana, whither he next went, he offered sacrifices, and exhibited sports and games; which were followed by a royal banquet; but his joy on this occasion was unexpectedly interrupted by the sudden illness and death of Hephaestion. From Ecbatana, he marched against the Cossæans, and subdued them; and he then pursued his course towards Babylon, where he formed a variety of new projects; but before any of his plans could be fully carried into effect, he was seized with a fever, occasioned, as some say, by excess of drinking, which, in a few days, terminated his life. He died on the 21st of April, in the second year of the 114th Olympiad, B. C. 323, after he had lived thirty-two years and eight months, and reigned twelve years and eight months. When his principal courtiers, perceiving his death to be inevitable, asked him to whom he left the empire, he answered, ‘to the most worthy;’ and when Perdiccas enquired at what time they should pay him divine honours, he replied, ‘when you are happy;’ and having pronounced these words, he expired. Alexander’s corpse was embalmed, after the manner of the Egyptians and Chaldeans; and Aridæus, his bastard brother, who had been declared king, was appointed to convey it to the temple of Jupiter Ammon. Two whole years, see *Aelian.* lib. xiii. c. 30. tom. ii. p. 898, were employed in preparing for this magnificent funeral, during which, Olympias bewailed the fate of her son. The funeral procession, conducted by Aridæus, was singularly splendid. Ptolemy advanced with a guard of his best troops, as far as Syria, to meet the procession.

He prevented their depositing the corpse in the temple of Jupiter Ammon, and conveyed first to the city of Memphis, and thence Alexandria. Here he reared a magnific temple to the memory of Alexander, and rendered him all the honours which were usually paid to demi-gods and heroes by Pagan antiquity. Freinshenius, in his Supplement to Livy, lib. cxxxiii. c. 65. tom. vi. p. 910, ed. Drakenb., relates, after Leo Africanus, who lived in the fifteenth century, that the tomb of Alexander was to be seen in his time, and that it was reverenced by the Mahomedans, as the monument, not only of an illustrious king, but of a great prophet.

Alexander, as to his person, was of a middle size, with his neck somewhat awry; having full eyes, and a fierce majestic countenance. His talents, and general character, have been differently appreciated by his biographers. It is certain that he rendered essential service to science by the presents which he conferred on his preceptor, and employed men of talents of every description, and liberally rewarded them. But when we consider the greater part of his life, well might the Gentoo annals call him ‘a mighty robber and murderer;’ and justly does the author of the first book of Maccabees characterize him, by saying, ‘he butchered kings,’ εσφάξε βασιλείς της γης. ‘What have we to do with thee,’ said the Scythian ambassador, ‘we never once set our foot in thy country. Are not those who live in woods allowed to be ignorant of thee, and the place from whence thou comest? Thou boastest, that the only design of thy marching is to extirpate robbers; and thou thyself art the greatest robber in the world!’ To the same effect was the answer of the pirate, when Alexander questioned him, what right he had to infest the seas? Alexander has been praised for his contumacy, yet his life was by no means regular in this respect. In his early youth indeed, he appeared so indifferent to the sex, that his mother suspected him to be impotent; and his behaviour to the Persian captives shows him to have had a great command over himself in this particular. The wife of Darius was a finished beauty; her daughters were likewise considered handsome; yet this young prince, when he had them in his power, not only bestowed on them all the honours due to their high rank, but managed their reputation with the utmost delicacy. The Amazon Thalestris could not obtain from him a compliance with her gallant request till after a delay of thirteen days. But in opposition to all this, what are we to conclude from his causing his favourite mistress Pancaste to be drawn naked by Apelles, and whom he indeed gave to the painter, who fell in love with her? What of that immoderate love of boys, which Athenæus relates of him? What of that prodigious number of wives and concubines, which he kept? Nothing surely, but that the continence of his early years was a piece of affectation proceeding from his ruling passion, vanity. His excesses with regard to wine were notorious, and almost beyond imagination; and he committed, when intemperately, a thousand extravagancies.—*Diodorus Siculus,* lib. xvii. tom. ii. p. 160.—253. ed. Hist. book xv. vol. iv. & v.

ALEXANDER SEVERUS, the Roman emperor, was born at Acre, in Phœnicia, according to one account, in the year 208, and according to another, Dec. 12, 205. His father, Genesius Marciianus, was a Syrian, and became a consul. His mother, Mamaea, was the daughter of Julia Mæsa, the sister of Julia, wife to the emperor Severus; and as another daughter of Mæsa was married to Heliogabalus, Alexander, (or Alexianus, which was his family name), was first cousin to that emperor. She was a woman of talents, and having imbibed Christian principles, is said to have paid particular attention to his education and moral improvement. His application, and improvement corresponded with his advantages. With a robust and graceful form, and considerable mental accomplishments, he combined a mild, humane, and generous temper, and made it his chief study to please and oblige. When Mæsa, his grandmother, perceived the approaching termination of Heliogabalus's career of profligacy, she embraced a favourable opportunity of persuading him to adopt Alexander. Accordingly he assumed this name instead of that of Alexianus, with the addition of Severus, and was invested with the title of Caesar, A.D. 221. The young prince soon gained the affections of the people to a degree which excited the jealousy of the emperor, who, therefore, resolved to destroy the dangerous competition, either by corrupting the manners, or by taking away the life of his aspiring rival. Mamaea and her mother defeated his design, and, by means of the Praetorian guards, the very attempt of Heliogabalus, against the honour and life of the young Caesar, terminated in his own ignominious death. By the same auxiliaries, Alexander in the year A.D. 222, was advanced to the throne; and the senate invested him with the various titles and powers annexed to the imperial dignity; offering him at the same time the name of Antoninus, and the surname of Great; which, however, he modestly declined. With the consent of his mother Mamaea, he married the daughter of a patrician, who afterwards became the object of her jealousy and cruelty, and was by her instigation banished into Africa. Under her direction, and with the approbation of the senate, a council of state was appointed, consisting of sixteen of the wisest and most virtuous senators. At the head of which, as praetorian prefect, was Ulpian, distinguished by his knowledge and respect for the laws of Rome. The prudent firmness of this aristocracy restored order and authority to the government; and, by their influence, the city was purged from the superstition and luxury, which Heliogabalus had introduced, and every department of public administration was dignified by diplomatic probity. But the most important objects of Mamaea's solicitude was that of forming the character of the young emperor. His excellent understanding encouraged cultivation. The natural mildness and moderation of his

temper preserved him from the precipitation of passion, whilst his affection for his mother, and his respect for the wise Ulpian, guarded him from the poison of flattery. He was very indulgent to the Christians; and seems to have been himself well acquainted with the Christian morals; for he frequently repeated the gospel golden rule, 'Do as you would be done by,' caused it to be inscribed over the gates of his palace, and on several public edifices; adopting it as the motto of his own private conduct.

'His ordinary occupations,' says a popular historian, 'exhibit a pleasing picture of an accomplished emperor; and, with some allowance for the difference of manners, might well deserve the imitation of modern princes. Alexander rose early: the first moments of the day were consecrated to private devotion, and his domestic chapel was filled with the images of those heroes, who, by improving or reforming human life, had deserved the grateful reverence of posterity. But, as he deemed the service of mankind the most acceptable worship of the gods, the greatest part of his morning hours was employed in his council, where he discussed public affairs, and determined private causes, with a patience and discretion above his years. The dryness of business was relieved by the charms of literature; and a portion of time was always set apart for his favourite studies of poetry, history, and philosophy. The works of Virgil and Horace, the republics of Plato and Cicero, formed his taste, enlarged his understanding, and gave him the noblest ideas of man and government.'

Although he was very religious, his offerings in the temples were not magnificent. He often repeated the words of Persius, Sat. ii. v. 69. 'In sancto quid facit aurum?' 'What has gold to do with sacred things?' His respect for virtue extended to the dead as well as the living. Accordingly he collected in Trajan's square the statues of the deified emperors of Rome, and of the famous Roman commanders, and adorned them with inscriptions, setting forth their great exploits and eminent virtues. In his palace he had two chapels, in which the principal objects of his veneration were ranged in two classes, the one destined to virtue, and the other to talents. In the first were placed the good emperors, among whom he very erroneously ranked Alexander the Great; and next to them the wise men, by whose useful lessons mankind had been benefitted; and here were blended Abraham, Orpheus, Apollonius Tyanaeus, and Jesus Christ. The second chapel was destined to military heroes, and men conspicuous in the republic of letters, Achilles, Cicero, Virgil, whom he called the Plato of the poets, and some others. In order to encourage the progress of letters and of science in general, he allotted pensions to rhetoricians, grammarians, physicians, architects, men skilled in mechanics, and even to augurs and astrologers. He established schools for all these arts, and provided for the instruction of the poor without expense to them. His life, however, has not been free from blemishes. His deference for his mother was considered as carried to a culpable excess. He gave her name to

several buildings, which, (as we learn from Ammianus Marcellinus, lib. xxviii. p. 372.) they retained in the fourth century, and caused her to be honoured with the titles of Augusta, mother of her country, of the armies, and of the senate. He was also charged with being of a suspicious and inquisitive temper, and with being inclined to vanity. His timidity likewise betrayed him into imbecility of conduct; particularly with reference to the praetorian guards, who by their mutiny produced a civil war in Rome, that lasted three days, and terminated in the massacre of Ulpian. Although this wise man sheltered himself in the emperor's palace, and was even murdered in his presence, he had not resolution sufficient to avenge this atrocious crime in the manner it deserved. Such indeed was the weakness of government, that the tyranny of the army threatened with instant death his most faithful ministers, and it is said to have endangered his own person. The historian Dion Cassius, who had commanded the Pannonian legions with a spirit of ancient discipline, and whom the emperor recompensed by appointing him his colleague in the consulship, was compelled to retire from the city, and to spend the greatest part of his consulship at his villas in Campania, and the remainder of his days in Bithynia, his native country. Dion. Cass. Hist. lib. lxxx. p. 1371.

This imbecility, however, was not uninterrupted. In one of these apyrexia, when some of the soldiers at Antioch had excited a sedition in the legion to which they belonged, and interrupted his mild expostulations by their clamours, he addressed them in the following dignified and spirited language: 'reserve your shouts till you take the field against the Persians, the Germans, and the Sarmatians. Be silent in the presence of your sovereign and benefactor, who bestows upon you the corn, the clothing, and the money of the provinces. Be silent, or I shall no longer style you soldiers, but citizens; if those indeed, who disclaim the laws of Rome deserve to be ranked amongst the meanest of the people.' When their brandished arms threatened even his person; 'your courage,' resumed the emperor, 'would be more nobly displayed in the field of battle; me, you may destroy—you cannot intimidate; and the severe justice of the republic would punish your crime, and revenge my death.' The clamour continuing, the emperor, with a loud voice, pronounced the decisive sentence: 'citizens, lay down your arms, and depart in peace to your respective habitations.' The clamour was instantly silenced, and the soldiers supplicated forgiveness; nor were they restored to their rank in the army, till he had punished with death those tribunes, whose connivance had occasioned the mutiny. When he became capable of taking the government into his own hands, and of exerting his genius and courage, he more effectually commanded the awe of his soldiers.

While Artaxerxes, the restorer of the Persian monarchy, was preparing to invade the Roman dominions, Alexander sent ambassadors in order to dissuade him from engaging the two empires in a long and dangerous war. The message was

received with contempt; nor did any of Alexander's remonstrances avail to prevent the Persian monarch from ravaging Mesopotamia and entering Cappadocia. The emperor, therefore, resolved to march against him in person. In the spring of the year 233, Alexander, with an army of the praetorian guards and part of the hardy legions of Europe, advanced towards the frontiers of the Roman dominions to meet the great king which was the haughty style assumed by Artaxerxes in his embassies; whose force consisted, as history reports, of 120,000 horse, clothed in complete armour of steel; 700 elephants, with towers, filled with archers, on their backs; and 1800 chariots armed with scythes. Of the event of the battle which ensued, historians have given very contradictory accounts. Herodian asserts, and Mr. Gibbon acquiesces in his account, that the plan of Alexander for the conduct of the war, however judiciously concerted, totally failed. The emperor himself, influenced by his mother's counsels, and perhaps by his own fears, deserted the bravest troops and the fairest prospect of victory; and, after consuming in Mesopotamia an inactive and inglorious summer, led back to Antioch an army diminished by sickness, and provoked by disappointment. But the Persian monarch, in several obstinate engagements against the veteran legions of Rome, lost the flower of his troops; and, instead of expelling the Romans from the continent of Asia, found himself unable to wrest from their hands the little province of Mesopotamia. Crevier and many other modern writers choose rather to follow Lampridius, whose account is entirely different from that of Herodian. The Persians, says the last author, were totally defeated, and Alexander approved himself an intrepid soldier and a skilful general. The great king fled before his valour; an immense booty and the conquest of Mesopotamia were the immediate fruits of this signal victory, Alexander, it is said, having taken care to guard Mesopotamia with several well garrisoned forts, returned to Rome, A. D. 234, to give the senate an account of his exploits, and was received by persons of all ranks with the greatest demonstrations of joy; and obtained a signal triumph. His triumphal car was drawn by four elephants; the air resounded with acclamations and the shouting attendants unceasingly exclaimed, 'Rome is happy, whilst she sees Alexander alive and victorious.'

Soon after his triumph, Alexander, accompanied by his mother, marched against the Germans, who had passed the Rhine, and who were making incursions into every part of Gaul. Upon his arrival in Gaul, he sent ambassadors to the barbarians in order to treat with them; and if Herodian may be credited, to purchase peace, which he preferred to the precarious issue of a war. Having passed the winter in the neighbourhood of the Rhine, he employed himself in introducing discipline among the licentious legions of Gaul. His attempts for this purpose produced discontents in the army, which were aggravated by a person, originally a barbarian of mean origin, whose father was a Goth, and mother an Alan, and who had been raised from the lowest station to the rank of a general officer.

This person was proclaimed emperor by the seditious soldiers: and made his way to the throne by the massacre both of Alexander and his mother. This event happened on the 19th of March, A.D. 235, when Alexander was in his twenty-seventh year, after a reign of thirteen years. The untimely death of this prince was universally regretted; and the soldiers, who were not concerned in the plot, manifested their resentment by a speedy vengeance in immediately killing his murderers. The senate decreed both to him and his mother divine honours; appointed for them altars, priests, and sacrifices; and instituted, in honour of the deceased emperor, an annual feast, which was celebrated on the first of October, the day of his nativity. *Crevier's Rom. Emp.* vol. viii. book xxiv. p. 279—350. *Anc. Un. Hist.* vol. xiii. p. 432—449. *Gibbon's Hist.* vol. i. p. 238. 240. 337, vol. ii. p. 450.

ALEXANDER (Jannaeus,) king of the Jews, was the third son of Hyrcanus, and succeeded his brother Aristobulus in the year before Christ, 106. Queen Salome, the widow of Aristobulus, took him and his two brothers out of prison, and placed Alexander on the throne. His fourth brother endeavoured to deprive him of the crown, and was put to death; but the youngest, whose name was Absalom, was favoured with his protection as long as he lived. Alexander, being a subtle and warlike prince, began his reign with leading an army against Ptolemais; but his own dominions being invaded during his absence, by Ptolemy Lathyrus, he was obliged to raise the siege and return to defend them. On the banks of the Jordan he was defeated, with the loss of 30,000 men, besides those that were taken prisoners; and, if he had not been succoured by Cleopatra, Lathyrus would have forced his way into Judea. Alexander, after an interview with Cleopatra at Ptolemais, returned to Jerusalem; and having recruited his broken army, marched against Cadara and took it. He next proceeded against Amathus, and reduced it after a very short siege; but he was soon obliged to relinquish it in consequence of a defeat by Theodotus, the son of Zeno, tyrant of Philadelphia, in which he lost many men, his baggage, and the whole of the treasure which he had taken at Amathus. The next place against which he directed his arms was Gaza, which had afforded protection and assistance to Lathyrus; and on this account, as soon as the town was betrayed to him, he revenged himself on the inhabitants, after leading them to expect clemency and moderation, by abandoning them to the fury of the soldiers. After which, he reduced the city to a heap of ruins. On his return to Jerusalem, the people, exasperated by the Pharisees, who were constantly caballing against him, insulted him with the most opprobrious language, exclaiming that such a slave as he, was unworthy of either the pontifical or regal dignity, and proceeded even to violence against his person. He was wearied with their clamours, and marched out of Jerusalem, in order to gratify his inclination for war. Having taken and destroyed the city of Amathus, he proceeded against the Arabians, whom he subdued, and then laid the Moabites and Mountaineers of Gilead under tribute. Near Gadara

he fell into an ambush, and it was with great difficulty that he regained his capital. During his absence, the Pharisees had caused a rebellion, which terminated in a civil war of six years' continuance. Demetrius, surnamed Euchærus, assisted the rebels; and, after some previous skirmishes, Alexander was defeated, and retired to the mountains. This defeat, however, induced the Jews, who had joined Demetrius, to desert him, and join Alexander; and Demetrius, alarmed by this defection, left Judea. Alexander then marched against the rebellious Jews; but the fury of their resentment continued, till a decisive battle put an end to the war. In this last action he cut off the greatest part of their army, and drove the rest into Bethome, which he besieged and captured. Josephus, who, being a zealous Pharisee, may possibly have exaggerated, informs us, that he caused 800 of the principal captives to be carried to Jerusalem, where they were all crucified at the same time and place; and that, whilst they were hanging on the cross, he ordered their wives and children to be butchered before their faces. It is added by the historian, that a banquet was prepared for himself and his concubines, near to this horrible scene, that they might behold and enjoy the torture and distress of the sufferers. After this event, the rebels dispersed; nor were the Pharisees able to make any effort against him as long as he lived. The succeeding years of his life were employed in extending his conquests through Syria, Idumæa, Arabia, and Phœnicia; and his return to Jerusalem, after an expedition of three years' continuance, was the occasion of loud acclamations on the part of his subjects. From this time, however, he devoted himself to drinking, and other debaucheries; which at length brought on a quartan ague, that prevailed till the day of his death, which happened about three years after his return. He died in his camp before Regaba, a fortress in the Gerasene territory beyond Jordan, which he was besieging, in the twenty-seventh year of his reign, in the year before Christ 79. He left two sons, Hyrcanus and Aristobulus; but decreed by his will, that his wife Alexandra should govern the kingdom during her life, and appoint for her successor either of them, according to her own pleasure. Alexandra, by conciliating the Pharisees, according to the advice of her husband, secured their influence with the people; so that they celebrated the funeral of the deceased king with great pomp, and confirmed her as sovereign administratrix of the nation. Her eldest son Hyrcanus was appointed high-priest, and the direction of all affairs of importance was committed to the Pharisees. Their resentment against those who had opposed them in the late reign still continued; and they contrived every method that was practicable for destroying them. This conduct induced the miserable subjects to assemble, and, with Aristobulus at their head, to wait on the queen, and implore her protection; but, the queen having surrendered herself and the government to the Pharisees, could devise no means for their redress. At length, however, she complied; and consented that they should disperse themselves into places where she had garrisons. In the year

before Christ 70, Alexandra was seized with a disorder which threatened her life; and when Aristobulus perceived her danger, he repaired to his friends, in the garrisoned towns, and they arranged themselves in great numbers under his standard; hoping that he would exert himself for abolishing the oppressive tyranny of the Pharisees, well knowing that no service of this kind could be expected from his brother Hyrcanus. The Pharisees were alarmed, and accompanied Hyrcanus to the queen, in order to represent what had occurred, and to demand her assistance. The impaired state of her health would not admit of her interference, and having left the care of the government to them, she appointed Hyrcanus her heir general, and soon after expired. Accordingly he took possession of the throne, and raised an army to oppose his brother. A battle near Jericho decided the quarrel. Hyrcanus, abandoned by the greatest part of his troops, was obliged to fly to Jerusalem, and afterwards to seek an asylum in the castle of Baris, whilst his partisans, who were chiefly of the sect of the Pharisees, took refuge in the temple. In a little while, they both submitted to Aristobulus; and in the year before Christ 69, he obtained both the high-priesthood and the crown. *Josephus Ant. lib. xiii. c. 12.—15. tom. i. p. 666—675. Bell. Jud. lib. i. c. 4, tom. ii. p. 59—62. Anc. Un. Hist. vol. iii. p. 114—123. Rollin's Anc. Hist. vol. viii. p. 4—11.*

ALEXANDER, (Padas,) king of Syria, was, as some say, the natural son of Antiochus Epiphanes; but, according to others, a young man of mean extraction at Rhodes, named Balas, suborned by Heraclides at the instigation of Ptolemy, Attalus, and Ariarthes, to personate the son of Antiochus Epiphanes, and under that title, to lay claim to the crown of Syria, in opposition to Demetrius. After he had been acknowledged by the three kings above-mentioned, Heraclides, who conducted the imposture, took him to Rome, in the year before Christ 153, and together with him Laodicea, the real daughter of Antiochus Epiphanes, and presented them to the senate, who received them graciously, and passed a decree in their favour; though, as Polybius asserts, *Legat. cxlii. p. 966*, the whole city was convinced of the imposture. The senate not only acknowledged Balas under the assumed name of Alexander, but decreed that their allies should assist him in his endeavours for recovering the rights of his father. Thus countenanced by the Roman senate, he landed in Syria, and found no difficulty in raising troops, which, together with the succours afforded him by Ptolemy, Attalus and Ariarthes, enabled him to make himself master of Ptolemais, the reduction of which induced a great number of persons to join him. Demetrius and Alexander were competitors for the favour and support of Jonathan, who had succeeded Judas Maccabeus in the command of the Jewish forces, and strove to outvie each other in their alluring offers. Alexander, however, prevailed; and with him Jonathan formed an alliance. These two competitors took the field at the head of their respective armies; and though Alexander was defeated, he maintained his ground;

and, being supplied by his powerful allies with fresh succours, succeeded in a second battle, in which Demetrius was killed, before Christ 150. Alexander having gained possession of the whole Syrian empire, sent an embassy to Egypt, demanding Cleopatra, the daughter of Ptolemy, in marriage; and the king not only complied with his request, but attended her in person, and the nuptials were solemnized at Ptolemais in a very splendid and magnificent manner. Alexander could not bear his elevation and prosperity, but became insolent and debauched, and committed the management of his affairs to a profligate and tyrannical favourite, whose name was Ammonius, who conducted himself with a degree of despotism, which exposed him and his master to the hatred of the nation. Demetrius, the eldest of the deceased king's sons, availed himself of this opportunity for recovering his right; and was acknowledged by Apollonius, governor of Cœlosyria and Phœnicie.

When Alexander was roused out of his lethargy, and perceived the danger of his situation, he applied to his father-in-law, Ptolemy, for assistance; who, with an army, which the author of the second book of Maccabees compares to the sand of the sea-shore, marched to his relief. Upon his arrival at Ptolemais he was informed that Alexander was plotting against his life, and that Ammonius had charged himself with the execution of this detestable scheme of treachery. Ptolemy complained to the king of Syria of this plot, and demanded the criminal to be delivered up to him; but Alexander refusing to comply, Ptolemy concluded that he was privy to the design, and determined to turn his arms against his son-in-law. He therefore sent ambassadors to young Demetrius, offering him his daughter Cleopatra, the wife of Alexander, and promising to settle him on the throne of his ancestors. Demetrius accepted the offer; and when the news of this event reached Antioch, Ammonius was put to death by the populace; but the inhabitants of this city refused to declare in favour of Demetrius. However, such was the hatred they had conceived against Alexander, that they entered into a confederacy against him, and opened their gates to Ptolemy, offering to put the crown on his head. This prince, says Josephus, knowing how to set bounds to his ambition, rejected the proposal, and with singular self-denial and generosity, declared, that he could not, without the most flagrant injustice, place himself on the throne of Syria, by excluding the lawful heir. He proceeded to recommend Demetrius by an eulogy on his character, and by pledging himself as guarantee for his future conduct, at the same time undertaking to assist him and to teach him the art of governing. These disinterested representations of Ptolemy had the desired effect. Demetrius was proclaimed king of Syria, and placed on the throne of his ancestors. Alexander, who was then in Cilicia, assembled a numerous army and advanced to Antioch. Ptolemy met him, and a bloody engagement ensued, in which Alexander was defeated; and his adherents abandoning him, espoused the cause of Demetrius. Upon this Alexander fled to Arabia, and seeking refuge in the house of Zabdiel, or

Zabel, or as Diodorus Siculus, in Excerpta Phoenicia, calls him Nicocles, was indeed

mortally by Alexander's friends; and when the head of the murdered prince was brought to him as a present from the Arabian, the joy he felt on the occasion put an end to his life. Demetrius, without any further opposition, took possession of his father's dominions, and styled himself from this victory Nicator, or the conqueror. Alexander Balas had reigned according to Josephus, five, but according to the history of the Maccabees, six years, (reckoning from the 160th year of the era of the Seleucidae to the 167th, which was the first year of the reign of Demetrius Nicator.) This happened in the year before Christ 145. Such is the account which Josephus gives of the troubles of Syria, and the death of Alexander Balas. But the author of the history of the Maccabees varies much from him, especially in what relates to the character of Ptolemy Philometor, whom Josephus highly commends; whereas the author of the first book of the Maccabees represents him as an ambitious and perfidious prince, who trampled under foot the most sacred laws of nature and justice, to raise himself on the ruins of his son-in-law. *Josephus Ant. lib. xiii. c. 2. 4. tom. i. p. 634—643. Diodorus Sic. tom. ii. p. 592. 1 Maccabees, xi. 4—12. Anc. Un. Hist. vol. viii. p. 224—233.*

ALEXANDER, bishop of Lincoln, in the 12th century, was by birth a Norman, educated under his uncle, bishop of Salisbury, and by his interest promoted to the episcopal see in 1123. Having been accustomed in early life to a splendid mode of living, he affected a degree of state, and indulged in unnecessary expenses. Henry of Huntingdon, in the dedication of his history to him, which is penned in the language of servile adulation, calls him 'the flower and top of the kingdom and nation; and he informs us that at the court of Rome he was styled "the Magnificent." St. Bernard, in a letter addressed to him about a year before his death, acts the part of a more honest friend, and cautions him 'not to be dazzled with the lustre of secular grandeur, nor to look upon any worldly advantage as permanent; nor value his fortune more than himself; to guard against the flattery of prosperity, for fear of a turn of misfortune, which will last longer: not to be charmed by the transient satisfactions of life; for that scene will quickly be shut up, and make way for another both lasting and uncomfortable.' He also advises him 'not to deceive himself with any distant prospect of death; for delusive hopes lead directly to danger and surprise, and are the likeliest way to hurry a man into the other world without preparation.' These prudent and salutary lessons, however, did not seem to have been regarded. In imitation of the barons and some of the bishops, he built three castles; one at Banbury, another at Sleaford, and a third at Newark. He likewise founded two monasteries. King Stephen was offended by these stately edifices and strong fortresses; and when he determined to take the castles from the barons, he seized that at Newark; in consequence of which the bishop was imprisoned for seven months, and with difficulty obtained his liberty.

From this time he employed his thoughts and time in ornamenting his church, which he had rebuilt with a stone roof the year after its consecration: increasing the number of its prebends, and augmenting its revenue with several manors and estates; and at length he rendered it the most stately and flourishing of any in the kingdom. He went twice to Rome, viz. in 1142 and 1144; and after his first visit, he returned as the pope's legate, and called a synod, in which he published many useful canons. In 1147 he visited the pope in France, and there fell sick through the heat of the weather. He returned to England and soon after died, in the twenty-fourth year of his prelacy. *Biog. Brit.*

ALEXANDER I. (pope, and a martyr,) succeeded Eoistus in the see of Rome, in the tenth year of Trajan, while the persecution was raging, in which Ignatius perished. He himself suffered martyrdom in 119, during the fourth persecution under Hadrian. The epistles extant under his name, are the forgeries of a later age; but the tradition, that he first introduced the use of holy water into the Romish church, seems to rest on a better foundation.

ALEXANDER II. (pope,) was a native of Milan, of the name of Anselm, and removed from the see of Lucca to that of Rome, in the year 1061. He was elected pope by the instance of Hildebrand, who was at the head of the ecclesiastical faction at Rome, in opposition to the empress Agnes, widow of Henry III. who was regent during the minority of her son Henry IV. and who supported the lay faction, in the interest that subsisted between the clergy and the laity. By her influence, Cadalus, bishop of Parma, was elected pope, under the name of Honorius II. The dispute was terminated by a council at Mantua in 1064, and Alexander, by a signal triumph of the church over the civil power, was declared lawful pope. The discipline and privileges of the clergy were the principal objects of this pontiff's attention; and the subordinate instrument of conducting his measures was Peter Damien, a monk. Alexander laid hold of every opportunity that occurred for interposing in the secular concerns of kingdoms and princes. He sanctioned the project of William, duke of Normandy, for the conquest of England; denounced excommunication against Harold as a perjured usurper; and sent William a consecrated banner, and a ring with one of St. Peter's hairs in it; thus, as Hume says, *Hist. vol. i. p. 186*, 'covering over safely all the ambition and violence of that invasion with the broad mantle of religion.'

Alexander extended his authority in all directions. He not only prohibited the young emperor from divorcing his wife Bertha, but, in 1073, summoned him to appear at Rome, and to account for his conduct in the disposal of church benefices for providing his army with supplies. The dispute was, however, closed by the death of the pope in 1073. The increase of papal tyranny, under the direction of Hildebrand, to whom this pope was subservient, discriminates his pontificate. Many of his letters on public affairs are extant; and one of them addressed to the bishops of Spain for the purpose

of restraining the cruelties which they exercised towards the Jews, does honour to his humanity. For an account of these letters, see *Dupin's Ecclesiastical History*, vol. iv. p. 29 : also, *Bower's History of Popes*, vol. v. p. 224.

ALEXANDER III. a pontiff of great ability, was born at Sienna, where he was bishop under the name of Roland, and succeeded Adrian IV. in 1159. At the time of his accession to the papal chair, Frederic I. was making vigorous attempts for reducing the power of the Roman see, and cardinal Octavian was elected pope under the name of Victor IV. in opposition to Alexander. After the death of Victor, in 1164, cardinal Guy was chosen by the influence of the emperor, and denominated Paschal III. but the whole interest of the Roman clergy was exerted in favour of Alexander, who, in the former pontificate, had been compelled to retire into France, and he now returned to Rome, and was restored to his see. Councils were summoned to settle the dispute. The council of Wurtzburg, convened by the emperor in 1166, produced an union of the nobility and clergy in support of the rights of Paschal ; and the council of Lateran, called by Alexander in 1167, deposed the emperor, and abrogated the oath of allegiance by which his subjects were bound to him as their lawful sovereign. At length an appeal was made to the sword ; and though Frederic was at first successful, and upon the death of Paschal procured the election of John, abbot of Strum, as his successor, under the name of Calixtus III., he was in the issue obliged to give up the contest, and in a treaty of peace, made with Alexander at Venice in 1177, to acknowledge him as lawful pontiff. The pride of Alexander knew no bounds on the occasion of this triumph. When Frederic was prostrate at his feet, he addressed him with the words of the Psalmist, 'Thou shalt tread upon the lion and adder ; the young lion and the dragon thou shalt trample under foot.' and when the emperor replied, 'Not to you, but to Peter,' the pope answered, 'To me and to Peter.' This story is discredited by some writers, but believed by others, and the truth of it is confirmed by concurring circumstances, for which we refer to Dupin. After the establishment of Alexander he treated his rival Calixtus III. with condescension and kindness, and appointed him to the see of Benevento. The pope, securely seated in the papal chair, directed his attention towards securing the independence, and maintaining the prerogative and privileges of the triple crown ; and in order to prevent the disorders likely to arise in future from equal factions, he obtained a canon in the third council of Lateran, held at Rome in 1179, which enacted, that the right of election to the pontifical dignity should not only be vested in the cardinals alone, but that two-thirds of the votes of the electors should be necessary for rendering it legal. Thus the people, and even the Roman clergy, were entirely excluded from all participation in the honour of conferring this important dignity.

At this council, the right of recommending and nominating to the saintly order was taken away from councils and bishops, and canonization was ranked among the greater and more im-

portant causes, the cognizance of which belonged to the pontiff alone. In this year he exercised that tyranny over princes, which had been usurped by the popes from the time of Gregory VII. in conferring the title of king, with the ensigns of royalty, upon Alphonso I. duke of Portugal, by an arrogant bull, in which he treats him as a vassal. Whilst he was in France, he had supported the cause of Thomas à Becket against his sovereign Henry II., and in 1164, when the constitutions of Clarendon, which asserted the king's jurisdiction over the clergy, were sent to him for confirmation, he rejected and annulled them. When Becket was banished, he received him kindly ; obtained for him a pension from the French king, abrogated the sentence that had been passed upon him ; re-invested him with his dignity, and appointed him his legate in England. After the murder of this arrogant prelate, Alexander, who had kept the king in awe during the whole of the contest, by the terror of excommunication, compelled him to undergo a very severe penance ; and having forgiven him, issued bulls at his desire, against his son, and canonized the archbishop. With a view of restoring order and tranquillity in the church, he convoked a solemn and numerous assembly of the clergy in 1164, in which the licentious rage of disputing about religious matters was condemned ; and in the council of Lateran, of 1179, a spiritual war was declared against heretics, and more particularly against the Albigenses.

Having enjoyed the undisturbed possession of the pontifical chair scarcely four years, Alexander III. died in the year 1181, with the character of having exhibited more ambition to obtain, than moderation in exercising, the supreme authority. *Dupin. Eccl. Hist.* vol. iv. p. 116. *Bower's Popes*, vol. vi. p. 11. *Mosheim*, vol. ii. p. 481. vol. iii. p. 53, &c. *Hume's Hist.* vol. i. p. 381. 396, &c.

ALEXANDER IV. (pope,) was Raynald or Roland, bishop of Ostia, and succeeded Innocent IV. in 1254, at the time of the contest between the Guelphs and Gibellines. The right of the Roman see to the disposal of the crown of Sicily was supported by a war, in the pontificate of Innocent IV., against Mainfroy or Manfred, regent for Conradi, the son of the emperor Conradi ; and this pope, in order to engage the assistance of a powerful ally, had conferred the crown on Edmund the second son of Henry III. of England. Alexander IV. pursued the plan of his predecessor, and published a crusade against Sicily, and, for defraying the expenses of it, induced Henry to levy a tenth on all ecclesiastical benefices in England for three years. A demand for farther supplies was however resisted, and the nominal possession of the crown reverted to Alexander ; but Mainfroy, having defeated the crusaders, became the real possessor of it, A.D. 1258. The pontiff was equally unsuccessful in his attempts to oppose the progress of Ezzelin or Ecelin, who, at the head of the Gibellines, and on the part of the heirs of Frederic II., had made himself master of Lombardy. In defiance of the banner of the cross, and anathemas fulminated by the apostolic see,

Ezzelin pursued his victories; and Mainfroy kept possession of the throne.

Alexander maintained the cause of the mendicant dominican friars, against the members of the university of Paris, who refused to admit them to a participation of the rights and privileges of their society; and condemned a book written by William de Saint Amour, one of the doctors of the Sorbonne, entitled, *The Perils of the Last Times*, in which the character of the dominicans was described, and their pride, hypocrisy, and licentiousness, cruelly censured. In the council of Arles, held in 1260, he condemned another book, written by the abbot Joachim, under the title of *The Everlasting Gospel*; and at the same time proscribed those who, under the denomination of Joachimites, had adopted the doctrine which this book promulgated. Differences of another kind having arisen between the states of Venice and Genoa, a council for settling them was summoned to meet at Viterbo; but in the mean time Alexander, oppressed by the dissensions of the church, and by the vexations which his ineffectual attempts for composing them produced, closed his life in the year 1261. ‘He appears,’ upon the whole, ‘to have been a narrow-minded bigot, more concerned to preserve and enlarge the privileges of a monastic order, than to correct abuses and encourage improvements.’ *Dupin Eccl. Hist.* vol. v. p. 50, 118, 138, &c. *Bower’s Popes*, vol. vi. p. 225. *Cave H. L.* tom. ii. p. 303. *Hume’s Hist.* vol. ii. p. 173, &c.

ALEXANDER V. (pope), was born in the isle of Candia, about the year 1339. His original name was Philargo, and his parents were so poor, that in his childhood he was a beggar. An Italian monk took him under his protection and instruction, and procured his admission into his order of friars minors. By his recommendation he became a student at Oxford, and afterwards took his degree of doctor in divinity at Paris. Having passed through several gradations of preferment, (being first bishop of Vicenza, then of Novara, and at length archbishop of Milan, cardinal, and legate of pope Innocent VII. in Lombardy,) he was unanimously elected pope by the cardinals, at a council in Pisa, in the year 1409. This pontiff was mild and liberal, and extended his generosity particularly to the mendicant orders of monks. Such was his munificence, that he used to say, ‘When I became a bishop, I was rich; when a cardinal, poor; and when pope, a beggar.’ He seems, however, to have counteracted his good qualities by the orders transmitted to the archbishop of Prague, enjoining him to proceed with rigour against Huss and his followers. This zealous reformed, confiding in the known candour of the pontiff, instead of personally appearing at Rome, in compliance with the summons that had been sent him, commissioned two friends to plead his cause, saying, on his own part, ‘I appeal from Alexander ill-informed, to Alexander well-informed.’ When Alexander proposed to visit Rome, he was persuaded by Balthasar Cossa to accompany him to Bologna. Whilst he was at this city he died, in the year 1410, having possessed the papal see little more than ten months; and Cossa, who was suspected

of hastening his death, by his influence with the cardinals, and a recommendation from Louis of Anjou, king of Sicily, was chosen to succeed him. *Dupin Eccl. Hist.* vol. v. p. 8, &c. *Bower’s Popes*, vol. vii. p. 123.

ALEXANDER VI. (pope), was born in 1431, at Valencia in Spain, and by the interest of his uncle, pope Calixtus III., was appointed cardinal in 1455; and afterwards archbishop of Valencia, and vice-chancellor of Rome. The emoluments of this last office enabled him to maintain the state of a prince, and supplied him with the means of licentiousness and extravagance. Under pope Sixtus IV. he was legate in Spain; and at last by assuming a sanctity, and by bribing the cardinals, he was elected, at the age of 61, to succeed pope Innocent VIII. in 1492. He then changed his original name of Roderic Borgia for that of Alexander VI. By Vanozza, a Roman lady, with whom he had continued an illicit connection for many years, he had five children. His second son was Caesar Borgia, who was a monster of debauchery and cruelty, and who is said to have quarrelled with his elder brother for the favour of his sister Lucretia, and to have killed him, and thrown his body into the Tiber. Notwithstanding his infamous character he was the favourite of his father, who trampled with contempt on every obstacle which the demands of justice, and the remonstrances of religion laid in his way, in order to aggrandize himself and his children. In his political connections he was faithless and treacherous; and formed alliances with the purpose of violating them. Having engaged Charles VIII. in an enterprise for the conquest of the kingdom of Naples, he entered into a league with the Venetians and with Maximilian, to rob him of the fruits of his victory; and after having obtained a large remittance from the sultan Bajazet, in order to enable him to carry on war against this king of France, he delivered up to him Zizom, the brother of Bajazet. Notwithstanding his notorious vices, he proposed to the Christian princes to march at the head of an army against the Turks; and under this pretext he issued a bull for a jubilee in 1500, by which he contrived to enrich his treasury. Of his presumption, as well as of his hypocrisy, we have a curious specimen in his division of America between the Spaniards and the Portuguese. For this purpose, he appointed that a line, supposed to be drawn from pole to pole, a hundred leagues to the westward of the Azores, should serve as a limit between them; and in the plenitude of his power, bestowed all to the east of this imaginary line upon the Portuguese, and all to the west of it upon the Spaniards—professing that zeal for propagating the christian faith was his motive.

The profligate career of this execrable hypocrite and tyrant was continued till the year 1503, when the poison, which he and his son Caesar had prepared for others, and particularly for Adrian, a wealthy cardinal, who stood in the way of their avarice and ambition, by a happy mistake terminated his own days. Some writers, amongst whom is Voltaire, have disputed this account of Alexander’s death; but Guicciardini and other reputable historians attest it. The life and actions of this pontiff shew

says Mosheim, that there was a Nero among the popes as well as among the emperors. Besides other instances of infamous licentiousness with which he is chargeable, he is accused of incest with his own daughter. And though it may be possible that the malignity of his enemies may have forged false accusations against him, and in some instances exaggerated the horror of his real crimes, yet there is upon record an authentic list of undoubted facts, which, by both their number and atrocity, render the name of Alexander VI. odious and detestable. His insatiable avarice is expressed in the following lines :

Vendit Alexander claves, altaria, Christum,
Vendere jure potest ; emerat ille prius.
Christ's altars, keys, and Christ himself,
Were bartered by this Pope for self :
But who shall say he did not well ?
That which he bought, he sure might sell.

Dupin's Eccl. Hist. vol. vi. p. 14. *Bower's Popes*, vol. vii. p. 328. *Mosheim's Eccl. Hist.* vol. iii. p. 431. *Robertson's America*, vol. i. p. 162, 8vo.

ALEXANDER VII. (pope,) was born of the illustrious family of Chighi, at Sienna, in 1599, and recommended by the marquis Fallavicini to pope Urban VIII. Having been inquisitor at Malta, and legate at Ferrara, he was nuncio in Germany, and employed at Munster in conducting the conferences that were intended to restore the peace of Europe. Some writers relate, that at this time he had formed the design of abjuring Popery, and embracing the Protestant religion, but was deterred from executing his purpose. Upon his return from this embassy, he was appointed bishop of Imola, in Romagna, and afterwards cardinal and secretary to the pope. His next advancement was to the papal chair, to which he was introduced by the unanimous suffrage of the sixty-four cardinals, which he contrived to obtain by that dissimulation and address of which he is said to have been complete master. After his election in 1655, he ordered his coffin to be placed under his bed in his apartments in the Vatican, that it might serve to him as a memento of mortality ; when he was robed in the pontifical habit, he appeared to have a hair-cloth under his shirt ; and when a wealthy female, signora Olympia waited upon him with congratulation, he dismissed her with a cold repulse, saying, 'It is not decent for a woman to enter the dwelling of the father of the church.' That the whole of this appearance of humility and self-denial was a farce, was sufficiently verified in his future conduct. His zeal for religion, and his concern for terminating the wars which distracted the Christian world, seem to have subsided after his elevation to the pontificate ; nor did he take any pains to conciliate the crowns of France and Spain. The five propositions of Jansenius, which contained the sum of his doctrine, had been condemned by Innocent X. ; but the Jansenists had contrived to evade this sentence by a subtle distinction, which allowed them to acknowledge that these propositions were justly condemned by the pope ; but to maintain that they were not contained in the book of Jansenius in the sense in which

they were condemned. At the instigation of their enemies, however, Alexander VII. the successor of Innocent, issued a bull in 1656, declaring, that the five propositions which had been condemned were the tenets of Jansenius, actually contained in his book, and proceeded, in 1666, to send into France the form of a declaration to this purpose, which was to be subscribed by all those who aspired to any preferment in the church. This declaration produced the most deplorable divisions and tumults.

It was vigorously opposed by the Jansenists, who maintained, that in matters of fact the pope was fallible, especially when his decisions were personal, and not confirmed by a general council ; and, consequently, that they were under no obligation to subscribe this papal declaration, which had merely for its object a matter of fact. Notwithstanding this intolerant bull, Alexander is said to have been liberal in his sentiments ; to have disapproved the severities exercised towards the Vaudois in Piedmont, and to have treated the Protestants who visited Rome with condescension. It is further related, that when some English gentlemen presented themselves at his feet to pay him the customary homage, upon finding that they were Protestants, he courteously said, 'Rise, you shall not commit what you think an idolatry ; I will not give you my blessing, but I pray God you may be worthy to receive it.' To the Jesuits this pontiff manifested a peculiar partiality ; for though Innocent X. had, in 1645, condemned the indulgence which these artful missionaries had shewn to the Chinese superstitions, Alexander virtually disannulled, in 1656, the sentence of his predecessors, and allowed the Chinese converts the liberty of performing several of the rites to which they had been accustomed, and to which they were principally attached.

This pontiff was a friend to literature and the fine arts, and expended considerable sums in promoting them. He embellished the city of Rome and erected the magnificent college, Della Sapienza, which he furnished with a fine library and botanical garden. He appointed six new professorships, and increased the salaries of the former professors. As an author, he has been highly extolled by his panegyrists ; a volume of Latin poems, entitled *Philomathi Musæ Juveniles*, consisting of heroic, elegiac, and lyric verses, and a tragedy under the title of *Pompey*, after the model of Seneca, written in his youth, whilst he was a student at Sienna, was published in folio, at the Louvre, in 1656. He died in the year 1667, with a higher reputation for talents than for honesty : and, as Bayle says, more lamented by the Jesuits than the Jansenists. *Mosheim's Eccl. Hist.* vol. v. p. 26—99—214. *Bower's Popes*, vol. vii. p. 483. *Gen. Dict.*

ALEXANDER VIII. (pope,) originally called Peter Ottoboni, was born at Venice in 1610 : and having studied at Venice and Padua, was made a bishop and cardinal by Innocent X. ; and at the age of seventy-nine succeeded Innocent XI. in the papal see. Instead of devoting the powers which he had acquired at this late period of life to the service of religion, his thoughts were chiefly employed in providing for his relation

and accumulating upon them honour and wealth. Accordingly one of his domestics being asked by this pontiff what the people said of him, replied, that they said, ‘he lost no time in the advancement of his family.’ ‘Right,’ says the pope, ‘for I have only half an hour left of the four and twenty.’ His indifference with regard to compromising the dispute that subsisted between France and the court of Rome, was considered by the French court as an evidence of his disposition to yield to the claims of the clergy of France; but at the close of his life, he issued a bull of excommunication against every thing that had been done to the prejudice of the pope’s authority in the assembly of the clergy of France in 1682. Having enjoyed the honour and emoluments of his station fifteen or sixteen months, he died in 1691, with a character stained with the reproach of avarice and duplicity. *Gen. Dict. Bower’s Popes*, vol. vii. p. 490.

ALEXANDER AB ALEXANDRO, so called, because his Christian and family names were Alexander, was born at Naples in 1461. He relinquished the practice of the law, to which he was at first devoted, because this profession endangered his integrity; and preferred a small fortune, in the tranquillity of retirement. Against the power and favour of the great, he says, an advocate would find it impossible to support his clients; and the issue of suits depended not so much on the justice of the cause, as on the will and favour of an indolent or corrupt judge; so that it was fruitless to study, with diligence and labour, controverted points of law, with the varieties of its cases; and adds, that the provisions of law, though wisely contrived, were often iniquitously perverted. From the works of the ancients, to which he had been accustomed to direct his attention, he made a collection of passages relating to the history and customs of the Greeks and Romans, which he arranged in six books, under the title of *Dies Geniales*; a work which manifests more learning than judgment or taste. An edition of this work, with notes by various writers, was published in two volumes 8vo. at Leyden, in 1673. The author appears to have been credulous and superstitious, and gives a strange account of dreams, spectres, haunted apartments in his house at Rome, &c.; he died in this city about the year 1523. *Gen. Dict.*

ALEXANDER AB ALEXANDRO, proto-medicus of Sicily, in which island he was born early in the fifteenth century; left a work on the duties and privileges of the office he held, which was afterwards published: *Constitutiones et regulata Jurisdictionis Regii protomedicatus Siciliae elucidata, scripta*. Haller says, circa A. 1429, edita Panormi, 1564, 4to. a I. Philippo Ingrassia.

ALEXANDER NOEL, or NATALIS, a Dominican friar, and one of the most laborious writers of the seventeenth century, was born at Rouen, in Normandy, in 1639, admitted into the order of Dominican friars, in 1655, and went to pursue his studies in philosophy and divinity, at the great convent in Paris. He afterwards taught philosophy in the same convent in which office he continued for twelve years; and declining that of a preacher, he devoted himself entirely to the

study of the scriptures and ecclesiastical history. He was created a doctor of the Sorbonne in 1675. By Colbert, the minister, with whose esteem he was honoured; he was introduced to his son, who was afterwards archbishop of Roan; and in this connection he enjoyed the conferences of persons of distinguished learning. These conferences led him to conceive the design of writing an ecclesiastical history. The first volume of this work, which he executed with great assiduity, and which was entitled, *Selecta Historiae Ecclesiasticae capita, et in loca ejusdem insignia Dissertationes Historicae Chronologicae Dogmaticae* was published in 1676. This work consists of twenty-six volumes in 8vo. the last four of which were not published till 1686. In the first volume he gives a history of the first age of the church, with an account of the persecutions which it suffered, the succession of popes, the heresies which arose, and the councils which condemned them, the writers in favour of Christianity, and the kings and emperors who reigned during the first century. To this volume are annexed twenty-eight valuable and much esteemed dissertations, upon such points as have been the subjects of dispute in history, chronology, criticism, or doctrine. The history of the second century was published in 1677 in two volumes, and to it are subjoined three dissertations against M. Daille with regard to fasting in Lent, confirmation, and the use of the fathers; and another dissertation concerning the time of celebrating Easter; and he also treats of the version of the Septuagint, &c. &c. The third century was published in 1678; and in three dissertations he has collected what relates to the life, manners, ordination, fall, errors, and defenders of St. Cyprian. The history of the fourth century, compiled in three volumes, and containing forty-five dissertations, was printed at Paris in 1679. In the three following years he published his history of the fifth, sixth, seventh, eighth, ninth, and tenth centuries; and that of the eleventh and twelfth centuries in 1683; and in these volumes there are several excellent dissertations. His sentiments on the subjects of some of these dissertations exposed him to the resentment of the court of Rome, which issued out a decree against his writings in 1684. Nevertheless, he published in the same year, in three volumes, the history of the thirteenth and fourteenth centuries, in which he continued to defend the rights of kings against the pretensions of that court, though he vindicates those princes who employed fire and sword against the Albigenses. He at last completed this work in 1686, by publishing four volumes, containing the history of the fifteenth and sixteenth centuries. The history of the Council of Trent occupies the greatest part of the last volume. Of this voluminous work, containing many curious particulars, there have been many editions. In 1689 he published a work of the same kind upon the Old Testament, in six volumes in 8vo. which extends from the creation of the world to the birth of Christ, and which period he has divided into six ages. From 1678 to 1680 he also published several other dissertations. In 1689 our author published his *Theologia Dogmatica et Moralis secundum*

Ordinem Catechismi Concilii Tridentini, in quinque libros tributa, i. e. Positive and moral Divinity, according to the order of the Catechism of the Council of Trent, in five books; printed at Paris in ten volumes in 8vo. and at Venice 1698. Another volume having been added in 1701, this work was printed at Paris, in two volumes in folio, in 1703, with a collection of Latin letters. He also published, in 1704, Commentaries on the four Gospels; in 1710, upon St. Paul's, and the seven Canonical Epistles; and he also wrote a Commentary on the Prophets Isaiah, Jeremiah, and Baruch, which was never printed: and he likewise published several other treatises, which we shall not recite. Towards the latter part of his life he was afflicted with the loss of his sight, which he bore with great calmness and resignation. He died in 1724, in the eighty-sixth year of his age. His piety, humility, and disinterestedness rendered him an object of general esteem. *Gen. Dict.*

ALEXANDER I. (king of Scotland,) was the son of Malcolm III. and succeeded his brother Edgar in 1107. His character was distinguished by vigour and impetuosity, which gave him the appellation of ‘the fierce:’ and which, though previously concealed by his piety and devotion, discovered themselves on his accession to the throne. His conduct both in the Northern and southern parts of the kingdom was so severe, that he awed the insurgents into submission; but a conspiracy was at length formed against his life, and the traitors, who were engaged in the execution of it, obtained admission into his bed-chamber at night, whilst he lodged at a castle in the Carse of Gowrie. Alexander, after having killed six of them, made his escape. Having reduced his own kingdom to order, he visited his brother-in-law, Henry I. of England, and assisted him in terminating a difference between him and the Welsh. He closed his reign in enacting and enforcing civil and ecclesiastical regulations, died a bachelor in the seventeenth year of it, and was succeeded by his younger brother, David. *Mod. Un. Hist.* vol. xli. p. 45.

ALEXANDER II. (king of Scotland,) succeeded his father William the Lion, in 1214, in his sixteenth year. His attempt to recover the possession of Northumberland was retaliated by a destructive expedition into Scotland, conducted by John, king of England. Whilst John was thus employed, Alexander reduced Northumberland; and, being forced to discontinue his pursuit of the English king, who was burning the towns, ravaging the country, and advancing towards the capital, he entered England by way of Carlisle, which he took and fortified, and proceeded as far as Richmond, in Yorkshire, retaliating upon the adherents of John, severities similar to those which his own subjects had suffered. But his progress was impeded, and he was compelled to return.

In 1221, he married the princess Joan, eldest sister of Henry III. of England, which contributed to preserve the peace of the two kingdoms. After her death in 1239, they were again embroiled; but by the mediation of the earl of Cornwall, Henry's brother, and the archbishop of York, they were again reconciled. Alexander, in his

voyage to quell some commotions that were excited in Argyleshire, fell sick, and being put on shore on an island called Kernery, on that coast, died in the fifty-first year of his age, and thirty-fifth of his reign. He was succeeded by Alexander III. his son by his second queen, the daughter of Egelrand de Coucy, one of the most powerful of the French nobility. *Mod. Un. Hist.* vol. xli. p. 77.

ALEXANDER III. (king of Scotland,) son of the preceding, succeeded his father at the age of nine years, in 1249. His marriage with Margaret, the daughter of Henry III. of England, was soon after solemnized in the presence of the two courts at York. On this occasion, Alexander paid homage to Henry for his English possessions; and, on being pressed to perform his homage for the crown of Scotland, he declined it. Alexander, upon his return to Scotland, found that the Cummins, a family of very great influence, had formed a strong party against his English connections, under the plea that Scotland was never any better than a province of England; and both the king and queen were committed to close custody in the castle of Edinburgh, where they were debarred from seeing any company, or associating with each other, and prohibited from all concern in the government. When Henry heard of their situation, he determined to relieve them, and for this purpose assembled his military tenants at York, and marched to the borders; and by his emissaries, whom he dispatched to the castle of Edinburgh, released the royal pair, and afterwards dispossessed the usurpers. The king then assumed the exercise of the regal power; and, as soon as he was of age, pardoned the Cummins and their adherents, upon their submitting to his authority. However, in 1263, Haquin, king of Norway, appeared on the coast, with a fleet of 160 ships, to make good his pretensions to the Western Islands; and, disembarking his troops, made himself master of the castle of Ayr, and advanced into the country. Alexander, having assembled an army, met him at a place called Largs; and, after a long and doubtful contest, the Scots army was victorious. Of the Norwegians, 16,000 are said to have perished in the field, and the Scots lost 5000. The ships of Haquin were so much wrecked the day after the battle, that he could scarcely procure a vessel to carry him and a few friends to the Orkneys, where he died of grief. His son and successor, Magnus, concluded a treaty with Alexander; and in consideration of his receiving 1000 marks of silver in two years, and an annual payment of 100 marks for ever after, renounced all claim to those islands. As a further cement of friendship, Margaret, Alexander's daughter, was betrothed to Eric, the son and heir of Magnus. In 1256, Alexander and his queen repaired to the English court, where they were sumptuously entertained; and when the queen was delivered, they both returned to their own kingdom. During the war between Henry and his barons, Alexander assisted him with 5000 men, and preserved the northern fortresses against all their attempts. Upon the accession of Edward I. to the throne of England, Alexander, with his family was present at his

coronation, and soon after paid him homage for his English estates. In the parliament, held at Westminster in 1282, Alexander attended as the first peer of England. In 1283 he lost his son Alexander, in the twentieth year of his age; and his death was soon followed by that of his sister the queen of Norway, who left an only daughter.

Having no surviving issue besides this infant princess, Alexander was urged by the nobility and the states of the kingdom to marry; and, in compliance with this request, he married Ioleta, daughter to the Count of Dreux in France. This excellent prince was soon after killed, whilst he was hunting, by his horse's rushing down a high precipice, A. D. 1285, in the forty-fifth year of his age, and the thirty-seventh of his reign. He was succeeded by Margaret, his grand daughter, and heir of his crown, who did not long survive him. Scotland was now in a very critical state, Edward I. was acquiring an influence in the kingdom, which no other English monarch ever possessed, and revived the claim of sovereignty, to which his father Henry had never pretended. The death of Alexander was much regretted; and the services he had performed to the kingdom demanded a tribute

of respect to his memory.⁷ He had introduced many excellent regulations of government; he had divided the kingdom into two parts, in each of which he occasionally resided, with a view of preserving the public peace, and for the purpose of more easily administering justice to all ranks of people; and he had greatly contributed to diminish the burdens of the feudal system, and to restrain the licence and oppressions of the nobility. The death of Alexander III. forms a remarkable era in the Scottish history. *Mod. Un. Hist.* vol. xli. p. 79, &c.

ALEXANDER, prince of Parma and Placentia, the son of Octavius Farnese, and great grandson of pope Paul III. succeeded his father in 1580; previous to which he had acquired the character of the greatest hero of his age; having given early proofs of uncommon courage, and military skill, in the wars of the Netherlands, under Don John of Austria: on which account, Philip king of Spain appointed him governor of the Netherlands, and prefect of Burgundy, upon the death of Don John. In 1566, he married the princess Mary of Portugal, and died in 1592, aged 48.

ALEXANDER OF RUSSIA.

ALEXANDER I. (Emperor of Russia and King of Poland), was the eldest son of Paul I. by his second wife, Sophia Dorothea, princess of Wirtemberg Stuttguard. He was born 22d December 1777, and the care of providing for his education being assumed by his grandmother, the Empress Catherine, she placed him under the tuition of the celebrated M. de la Harpe. In the year 1793 he married Elizabeth Aleviowna, princess of Baden; and on the sudden demise of his father (it was officially announced that he was *found dead in his bed*), in March 1801, he succeeded to the throne. The general amnesty published on his accession was allowed, it is said, to include all persons connected with his father's death, except one nobleman, who was sent into Siberia. The young emperor declared his intention of supporting the institutions, and abiding by the policy of his august grandmother. Russia having been precipitated by his predecessor into a maritime confederacy with the other northern powers against England, he very promptly manifested his desire to enter into amicable relations with this country; and on the 17th June a convention was signed at St. Petersburgh between the Russian ministers and Lord St. Helens, conceding the great British question, of the right to search neutral ships in time of war, and adjusting all matters in dispute. To this compact Denmark and Sweden immediately acceded. Few events in the history of the maritime struggles of Great Britain have been more important than was the dissolution of the northern confederacy at this juncture.⁸ Alexander was crowned at Moscow in September, and published on this occasion an *ukase* to discontinue the recruiting of the army, for diminishing taxes, liberating debt-

tors, and prohibiting all prosecutions for fines, together with a full pardon to deserters. In June 1802, he appeared, for the first time, personally among the potentates of Europe, and had an interview with the king of Prussia at Memel. France, under the guidance of Napoleon, was at this period making rapid conquests in the south of Europe; Buonaparte having been, in the preceding month, crowned king of Italy at Milan; shortly after which he annexed Genoa to France. But the cabinet of St. Petersburgh seems wisely to have thought that its distance from the scene of action, might well excuse the emperor from any active interference with the belligerent states. He contented himself, therefore, in 1803, with offering to interpose his good offices in restoring the newly ruptured peace between England and France. The arrest and murder of the Duc D'Enghein, however, aroused him to make a strong remonstrance the following year against this shameful violation of the neutral territory of Baden; and he appealed from the frivolous excuses of the French government on that subject, to the diet of Ratisbon. But the influence of France was at this time paramount in Germany.

On the 11th April, 1805, Russia came forth decidedly into the first of her great struggles with France, and signed a treaty with England, Sweden, and Austria, to use the most efficacious means for the purpose of putting a stop to the encroachments of the French government, and securing the independence of the different states. A large Russian force now, therefore, advanced into Germany, but not in time to rescue the capital of the emperor of Austria from the more rapid advances of Napoleon. On the second of December was fought the memorable battle of

Austerlitz, in which the emperor Alexander appeared at the head of 50,000 Russians, and the emperor Francis with an Austrian force of about half that amount : the result is well known. Buonaparte spoke always of the sun of Austerlitz as shining upon one of his most glorious days. His force was about equal, perhaps, to that of the allies ; whom, after a sanguinary and often doubtful contest, he compelled to quit the field. Alexander, in consequence, commenced his retreat on the sixth, and in the following July appears to have concurred very cordially in the negotiations for a general peace, which were conducted by the ministers of the different powers at Paris. But the Russian minister, M. d'Outrebril, having precipitately signed a separate treaty with France, the emperor refused to ratify it. The negotiations were broken off, and the relations of England and Russia remained undisturbed.

The French, at the close of this year, having completely humbled Prussia, advanced into Poland ; and on the 26th of November was fought between the French and Russians the equivocal battle of Pultusk. In that of Eylau, which was fought on the 7th and 8th of February, 1807, both parties again claimed the victory. On the morning, however, of the 9th, the Russian army found it necessary to retreat ; and on the 14th of June was completely beaten by the French in the memorable battle of Friedland. Lord Hutchinson, who was present, declared, in the British senate, that the Russians recrossed the Niemen with the loss of 40,000 men, 1848 officers killed or wounded, and 27 generals. The result was an interview between Alexander and the French emperor at the instance, it is said, of the latter ; and the celebrated treaty of Tilsit followed. Russia, by this compact, acknowledged the brothers of Buonaparte as kings respectively, of Naples, Holland, and Westphalia ; she formally recognised also the confederation of the Rhine, and promised to acknowledge all the sovereigns who might hereafter become members of that confederation. She engaged also that hostilities should, on her part, instantly cease with the Ottoman Porte, and that she would use her mediation to negotiate and conclude a peace between Great Britain and France. Secret articles are said to have been added, that Dantzic and the ports of Prussia and Russia should be shut against the commerce of Great Britain. By another secret article, Alexander also consented to concede Corfu and the seven islands to France. Such was the humiliating commencement of this prince's celebrated friendship with Napoleon.

In the autumn of 1806, the British cabinet was induced, from secret and pretty correct information of the designs of the French government upon them, to seize the eighteen Danish ships of the line then lying at Copenhagen, a measure which Russia thought proper to resent by declaring war against England. All British ships and property were detained, and the fort of Cronstadt put into a state of defence. Hostilities between England and Russia, however, were never carried much further than a cessation of commercial intercourse. A second meeting between

Alexander and the emperor of France took place at Erfurt on the 27th of September 1808, with the obvious design, on the part of the latter, of enabling himself, with safety, to withdraw his troops from Germany. For that noble resistance of his usurpations was now commencing in the Peninsula, which ultimately issued in the emancipation of enslaved Europe.

While in this year his good brother of France was thus well engaged, the troops of Alexander advanced upon Finland, took possession of Abo, the capital, in the month of March ; and on the 27th of September, 1809, procured the formal annexation of the greatest part of that province to Russia. The interruption of all commerce with England, began now to be severely felt by Russia ; and the restraints of Napoleon's continental system, were ill-brooked by the pride of Alexander. From the commencement of 1812, a storm seemed to be gathering, which threatened the destruction of French influence in the north of Europe. Alexander put his armies in motion ; and, by an imperial ukase of the 23rd of March, ordered a levy of two men in five hundred throughout his dominions. He concluded a treaty also with the Ottoman Porte, and settled all matters in dispute with Great Britain. Buonaparte, in the mean while, was pouring French troops, and those of the confederation of the Rhine, into Germany ; and occupied all the principal towns and fortresses of Prussia. On the 6th of June, Napoleon passed the Vistula, and shortly after, the Niemer. 'Russia,' said he, in one of his favourite harangues, 'is dragged along by a fatality ! Her destinies must be accomplished.—Are we no longer to be regarded as the soldiers of Austerlitz ?—Let us carry the war into her territory : a second war in Poland will be as glorious to the French arms as the first.' We cannot pursue the details of the memorable campaign that followed. Suffice it to say, that he who entered Russia at the head of from 300,000 to 400,000 men, after having defeated the Russians in almost every pitched battle that they fought ; after having taken Moscow, the capital of the empire, returned *alone!* and of his immense army but 50,000 ever re-passed the Russian frontier. Alexander, who had hitherto only fought for independence, now resolved in his turn to become the aggressor ; and, joining his army in Poland, published in February 1813, the celebrated manifesto, which served as a basis for the coalition of the other powers of Europe, against the rapacity of the French. The battle of Leipsic, in which the allies compelled the French to retire, seems to have been almost the last struggle of Napoleon, to preserve his dominion over the other potentates of Europe. The Russian monarch marched with the rest of the allies into France ; and it was principally to the efforts of Alexander, that, after about two months of constant fighting, with various success, one bold and great push was made to seize on Paris which the allies reached on the 30th of April 1814, at six in the morning, and which they occupied by capitulation, at three in the afternoon. At the peace, Alexander visited England, and amongst a succession of fêtes given upon the

occasion, dined with the prince regent, the emperor of Austria, and king of Prussia, at the Guildhall of London.

On his return he seems to have occupied himself in sincerely endeavouring to improve the internal condition of his empire. Early in his reign, he had given it, in a manner, a new constitution; re-organizing the senate and limiting the power of governors. When he was crowned king of Poland in 1815, he limited his own authority, granted legislative powers, and the privilege of self-taxation to the Polish senate, and a representative body to the people. One of his statutes forbade the confiscation of hereditary property in Russia, in any criminal case whatever, an advantage, until his reign, enjoyed only by the nobility. Nor should we omit to state, that he was decidedly the friend of literature, the arts, and every moral and benevolent institution of the age. The noble support he afforded to the Russian Bible Society, may be instanced as a proof of our last remark.

In the flower of his age this distinguished prince was seized with a fatal illness, and died at Taganrok, a fortress of the sea of Azof, in November, 1825.

The French papers, in conveying the intelligence of his death, coupled it with a curious extract from the Royal Prussian Calendar, in which the second brother, the grand duke Nicholas, was declared heir to the throne, in omission of his elder brother Constantine. Such intimation could scarcely originate in error in that quarter; and in consequence, it was at first inferred that Constantine was set aside. This inference was the more rational, as an *ex post facto* law had really passed to supersede any issue which he might have by his second marriage with the countess Gradinska, an accomplished Polish lady, on the ground that children to succeed must be royal on both sides. Reports also attributed sinister attempts to Constantine four or five years ago, which it was insinuated, led to his virtual renunciation of the right of succession; and one English paper boldly asserted that Alexander met a violent death. These rumours, however, appear to have rested on no adequate foundation; and in spite of the authority of the Berlin Almanack, the emperor Constantine set out on the 8th of December from Warsaw, for St. Petersburg, where he was proclaimed on the 15th. The Court of Berlin had been previously apprised of the illness of Alexander; the proximate cause of whose decease originated in the breaking out of erysipelas in his leg, that he was aware of his own danger, and died as became him. The Russian authorities in London took an oath of allegiance to the new emperor Constantine, on Sunday the 25th of December.

On the whole, this monarch cannot be denied the meed of considerable commendation with respect to the internal management of his great empire. If he has not all the glory of a Peter I. in originating improvements, he has the great credit of continuing and enlarging them with exemplary patience and industry; and if he never pursued the ambitious projects of a Catherine with regard to other nations, he nobly defended and rescued his country from the grasp of an

unprincipled usurper, and was foremost in a series of conflicts, essential to the liberty of half the civilized world. To hold the balance even in respect to his character, there seems to have been, of late years, a more decided leaning in this prince to arbitrary measures, both at home and abroad; and he is one of those potentates who has been busily engaged in the so-named Holy Alliance.

ALEXANDER'S TOMB, an elegant and very ancient sarcophagus, supposed once to have contained the body of Alexander the Great; and now, through the zeal and enterprise of Dr. E. D. CLARKE, deposited in the British Museum. It is an entire block of green Egyptian breccia, a beautiful variegated marble, of which few specimens remain, measuring ten feet three inches and a half in length, three feet ten inches in height; at the circular end, five feet three inches, and at the other end, four feet two inches in breadth; covered with hieroglyphics.

This valuable relic of antiquity had been removed by the French from the mosque of St. Athanasius, at Alexandria, when the British troops entered that place; and Dr. Clarke found it concealed in the hold of a hospital-ship, in the inner harbour, half filled with filth, and covered with the rags of the sick. All descriptions of the inhabitants and visitants, with whom the learned traveller conversed, concurred in the tradition of its being the tomb of ISCANDER (Alexander), the founder of the Alexandrian city. On its shipment for England, in the Madras, the Capitano bey, with many Turks of distinction, came on board to pay a last testimony of devotion to this proud trophy of British valour; and, according to General Turner, 'all solemnly touched the tomb with their tongues.' The privilege to render this act of adoration being a contribution of six paras or medins to the iman of the mosque. On taking leave, the Capitano bey expressed his belief that Providence would never suffer the tomb to go safe to England.

The chain of evidence by which Dr. Clarke supports his confident opinion of the identity of this sarcophagus with the real tomb of Alexander, is as follows: The body of Alexander, according to Plutarch, being embalmed at Babylon by certain Egyptians and Chaldeans, his funeral was delayed for two years, by the disputes amongst his successors, and, still more, by the immense preparations which were made for that solemnity. A notion prevailed, that the final possession of it would be most propitious to the state with whom it might rest; whence Perdiccas, who afterwards conducted the funeral procession, would have deposited it in the sepulchre of the kings of Macedon; but Alexander had ordered it to be taken to the temple of Jupiter Ammon, in Lybia. Diodorus Siculus, lib. xviii, c. 26., gives an elegant and most interesting account of its movement thither. The car, on which it was conveyed, was the most magnificent the world had then seen; a prodigious concourse of people attended it from all the cities near which it passed; and Ptolemy Soter, receiving intelligence of its approach, went out with an army as far as Syria to meet

it. Pretending to render the highest honours to the imperial cors, he conducted it to Memphis, and there it was detained until the shrine, in which he now determined to deposit it at Alexandria, was finished. This is described by the above historian as being constructed with all possible magnificence, and as standing within the city of Alexandria. Pausanias mentions the removal of the body from Memphis; Quintus Curtius, its being ultimately carried to Alexandria with great pomp; and Strabo, 'that there it still lies, though not in its original coffin, a case of glass having been substituted for the gold covering, which a later Ptolemy had removed.'

* Augustus visited the tomb B.C. 30; and Dion Cassius mentions the singular circumstance of the emperor's mutilating the nose, in touching

the body: he placed a golden crown upon it, on departing, and scattered flowers over it. Caligula is said to have taken away the breast-plate from the armour in which Alexander was buried, and occasionally to have worn it himself. A.D. 202, it was visited by Septimus Severus, who causing a strict search to be made through Egypt for all the monuments of its ancient literature, deposited them in the tomb of Alexander, and ordered the shrine to be closed from all future access. Caracalla, however, in 213, presumed to violate this injunction, placing a purple vest, splendid rings, &c. on the tomb; and here closes all the direct history of its existence. For further particulars respecting this interesting monument See ALEXANDRIA.

ALEXANDREA, in ancient geography, a mountain of Mysia, on the sea coast, forming a part of mount Ida, where Paris is fabled to have given judgment on the three goddesses.

ALEXANDRETTA, called by the Turks Scanderoon; a town in Syria, at the extremity of the Mediterranean sea. It is the port of Aleppo, from which it is distant twenty-eight or thirty leagues, but is now, properly speaking, nothing else but a village, without walls, in which the tombs are more numerous than the houses, and which entirely owes its existence to the road which it commands. This is the only road, in all Syria, where vessels anchor on a solid bottom, without their cables being liable to chafe; but in other respects it has many inconveniences. It is infested, during winter, by a wind, called by the French sailors le Raguer, which, rushing from the snowy summits of the mountains, frequently forces ships to drag their anchors several leagues. And when the snow begins to cover the mountains which surround the Gulph, tempestuous winds arise which prevent vessels from entering for three or four months together. The road also to Aleppo by the plain is infested by Curd robbers, who conceal themselves in the neighbouring rocks, and frequently attack and plunder the strongest caravans. But the worst circumstance is the extreme unwholesomeness of the air, occasioned here by stagnant waters and mephitic exhalations. It may be affirmed, that this every year carries off one third of the crews of the vessels which remain here during the summer; nay, ships frequently lose all their men in two months. The season for this epidemic disorder is principally from May to the end of September; it is an intermitting fever of the most malignant kind, and is accompanied with obstructions of the liver, which terminate in a dropsey. To this baneful epidemic, Alexandrettta, from its situations, seems to be irremediably condemned; for the plain on which the town is built is so low and flat, that the rivulets, finding no declivity, can never reach the sea. When they are swelled by the winter rains, the sea, swelled likewise by tempests, hinders their discharging themselves into it: hence their waters, forced to spread themselves, form lakes in the plain. On the approach of the summer, the waters becoming corrupted

by the heat, exhale vapours equally corrupt, and which cannot disperse, being confined by the mountains that encircle the gulf. The entrance of the bay besides lies to the west, which in those countries is the most unhealthy exposure, when it corresponds with the sea. The labour necessary to remedy this would be immense, and after all insufficient; and, indeed, such an undertaking would be absolutely impossible, under a government like that of the Turks. Several years ago, Mr. Volney informs us, the merchants of Aleppo, disgusted with the numerous inconveniences of Alexandrettta, wished to abandon that port and carry the trade to Latakia. They proposed to the Pacha of Tripoli, to repair the harbour at their own expense, provided he would grant them an exemption from all duties for ten years. To induce him to comply with their request, the agent they employed, talked much of the advantage which would, in time, result to the whole country: 'But what signifies it to me what may happen in time?' replied the Pacha; 'I was yesterday at Marach; to-morrow, perhaps, I shall be at Djedda: Why should I deprive myself of present advantages, which are certain, for future benefits I cannot hope to partake of?' The European factors were obliged therefore to remain at Scanderoon. There are three of these factors, two for the French, and one for the English and Venetians. The only curiosity which they have to amuse strangers with, consists in six or seven marble monuments, sent from England, on which you read: 'Here lies such an one, carried off in the flower of his age, by the fatal effects of a contagious air.' The sight of these is the more distressing, as the languid air, yellow complexion, livid eyes, and drop-sick bellies of those who show them, make it but too probable they cannot long escape the same fate. It is true, they have some resource in the village of Ballan, the pure air and excellent waters of which surprisingly restore the sick. The Aga, for some years past, has applied the duties of the custom-house of Alexandrettta to his own use, and rendered himself almost independent of the Pacha of Aleppo. The Turkish empire is full of rich rebels, who frequently die in peaceable possession of their usurpations.

ALEXANDRIA.

ALEXANDRIA, now called Scanderia, the ancient capital of Lower Egypt, was built by Alexander the Great, B. C. 335. It was situated on the Mediterranean, between the lake Mareotis and the beautiful harbour formed by the Isle of Pharos, about twelve miles west of the Canopic branch of the Nile, in N. lat. $31^{\circ} 10'$. and E. long. $30^{\circ} 19'$. It is probable, says a popular historian, that the opposition and efforts of the republic of Tyre, which gave Alexander so long and so severe a check in the career of his victories, led him to perceive the vast resources of a maritime power, and suggested to him an idea of the immense wealth which the Tyrians derived from their commerce, especially that with the East Indies. As soon, therefore, as he had accomplished the destruction of Tyre, and reduced Egypt to subjection, he formed the plan of rendering the empire, which he designed to establish, the centre of commerce as well as the seat of dominion. With this view he founded a great city, which he honoured with his own name, near one of the mouths of the river Nile, that, by the Mediterranean sea and the vicinity of the Arabian gulf, it might command the trade of both the east and west. He had no sooner conceived the design than he hastened to execute it. And so sudden was his resolution, that after he had directed where every public structure was to be placed, fixed the number of temples, and the deities to whom they should be dedicated, &c. there were no instruments at hand proper for marking out the walls, according to the custom of those times. Upon this, a workman advised the king to collect what meal was among the soldiers, and to sift it in lines upon the ground, whereby the circuit of the walls would be sufficiently marked out. The advice was followed; Dinocrates, the most celebrated architect of the age, was employed to draw up the plan, and every resource of power and art was employed to render it worthy of the name of its founder; which now became the chief commercial city in the world. During the subsistence of the Grecian empire in Egypt and in the east, and amidst all the successive revolutions in those countries, through a period of about 1800 years, commerce, particularly that of the East Indies, continued to flow in the channel, which the sagacity and foresight of Alexander had prescribed.

The breaking up of the empire of Alexander did not retard the progress of Alexandria to opulence and greatness. It became the capital of the Ptolemies, a race of enlightened princes, who placed their glory in commerce and the sciences. They erected, on an island opposite to the mouth of the harbour, a pharos, or light-house, which was considered one of the wonders of the ancient world. Alexandria then engrossed the commerce of India, the grand object of ancient ambition. The goods being brought up the Red Sea, were landed at Berenice, and being carried across to the river, were there embarked, and conveyed down to the city.

This city, says a modern traveller, was a league

and a half long by one-third in breadth, which made the circumference of its walls about four leagues. Quintus Curtius, lib. iv. c. 8. tom. i. p. 221, makes them eighty stadia, or a little more than nine miles. According to Pliny, II. N. lib. v. c. 10. tom. i. p. 258, they were fifteen miles. Strabo, lib. xvii. tom. ii. p. 1143, makes the length of the city thirty stadia, and the breadth between seven and eight stadia; and Diodorus Siculus, lib. xvii. tom. ii. p. 590. ed. Wessel, makes the circuit ninety stadia, or somewhat more than eleven miles; and he says, that the city was peopled by 300,000 free inhabitants, besides, at least, an equal number of slaves. The lake Mareotis bathed its walls on the south, and the Mediterranean on the north. It was intersected lengthwise by straight parallel streets. This direction left a free passage to the northerly wind, which alone conveys coolness and salubrity into Egypt. A street, two thousand feet wide, began at the gate of the sea, and terminated at the gate of Canopus. It was decorated by magnificent houses, by temples, and by public buildings. In this extensive range the eye was never tired with admiring the marble, the porphyry, and the obelisks, which were destined at some future day to embellish Rome and Constantinople. This street, the handsomest in the universe, was intersected by another of the same breadth, which formed a square, at their junction, half a league in circumference. From the middle of this great place the two gates were to be seen at once, and vessels arriving under full sail from the north and from the south. A mole, of a mile in length, called Hepta Stadium, stretched from the continent to the Isle of Pharos, and divided the great harbour into two. That which is to the northward preserved the name of the founder, and was called the Great Port. A dyke, drawn from the island to the rock on which the Pharos was built, secured it from the westerly winds. The other was called Eunostos, or the Safe Return. The former is called at present the New, and is the port to which the vessels of Europe resort; the latter is the Old harbour, and is that to which those only from Turkey are admitted: a bridge that joins the mole to the city served for a communication between them. It was raised on lofty pillars sunk into the sea, and left a free passage for the ships. The palace, which advanced beyond the promontory of Lochias, extended as far as the dyke, and occupied more than a quarter (a third or fourth, says Strabo) of the city. Each of the Ptolemies added to its magnificence. It contained within its enclosure the museum, an asylum for learned men, groves and buildings worthy of royal majesty, and a temple where the body of Alexander was deposited in a golden coffin. Perdiccas, it is said, undertook to convey the body of Alexander to the temple of Jupiter Ammon, agreeably to the will of that prince; but Ptolemy, son of Lagus, carried it off, and placed it in the palace of Alexandria. The infamous Seleucus Cibyosactes violated this monument, carried off the golden

coffin, and put a glass one in its place. In the great harbour was the little island of Anti-Rhodes, where stood a theatre and a royal place of residence. Within the harbour of Eunostos was a smaller one, called Kibotos, or Cibotus, q. d. the harbour of the arch, dug by the hand of man, which communicated with the Lake Mareotis by a canal. Between this canal and the palace was the admirable temple of Serapis, and that of Neptune, near the great place where the market was held. Alexandria extended likewise along the southern banks of the lake. Its eastern part presented to view the Gymnasium, with its porticos more than 600 feet long, supported by several rows of marble pillars. Without the gate of Canopus was a spacious circus for the chariot races. Beyond that the suburb of Nicopolis ran along the sea shore, and seemed a second Alexandria. A superb amphitheatre was built there, with a race-ground, for the celebration of the Quinquennialia, or feasts that were celebrated every fifth year. Such is the description, says Savary, Letters on Egypt, vol. i. p. 29, left us of Alexandria by the ancients, and above all by Strabo. The original architect of this city is said to have acquired great reputation by rebuilding the temple of Diana at Ephesus, which Herodotus had burnt.

Ptolemy Soter, one of Alexander's captains, who, after the death of this monarch, was first governor of Egypt, and afterwards assumed the title of king, made this city the place of his residence, about 304 years before Christ. This prince founded an academy, called the Museum, in which a society of learned men devoted themselves to philosophical studies, and the improvement of the sciences; he also gave them a library, which was prodigiously increased by his successors; and induced the merchants of Syria and Greece to make this city a principal mart of their commerce. His son and successor, Ptolemy Philadelphus, pursued the designs of his father, and completed the tower of Pharos; brought hither the image of the god Serapis, from Pontus; erected the famous temple of Serapion; improved the Alexandrian Library, and finished the canal, begun by Nectos and carried on by Darius Hystaspes, which was intended for joining the Nile to the Red Sea. Ptolemy Euergetes, imitating the example of his predecessors, contributed to the wealth and prosperity of Alexandria. But the voluptuousness of Alexandria became proverbial: hence, 'Ne Alexandrinis quidem permittenda deliciis.' Quintilian. For about 300 years, from the commencement of the reign of Ptolemy Soter to the death of Cleopatra, Alexandria continued in subjection to the Ptolemies; but most of them devoted themselves to indulgence and pleasure, and, by their example, contributed to that corruption which ultimately terminated in the ruin of this famous city. Ptolemy Physcon, in particular, was a monster of vice and cruelty. About the year B. C. 136, he put to death or banished most of those persons who had been in favour with his brother Philometor, and who had been employed during his reign; and permitted his foreign troops to plunder and massacre at discretion. Many of the inhabitants of Alexandria, terrified by his

savage conduct, and in order to avoid his cruelty, retired into foreign countries, and left the city almost a desert. Of these there were grammarians, philosophers, geometers, physicians, musicians, and other masters in the liberal sciences, who disseminated the polite arts and general science through Greece, Asia Minor, and the islands, and indeed to every place whither they fled. To supply the places of these fugitives, Ptolemy caused proclamation to be made in all the neighbouring countries, that persons of any nation, who were desirous of settling at Alexandria, should receive suitable encouragement. The proposal was accepted by many, and the houses and privileges which belonged to the former inhabitants were assigned to these new settlers, and thus the city was repeopled: but they soon found reason to dislike their situation, and to hate their new sovereign. Cruel and timid as he was, he determined to massacre all the young men of the city; and for this purpose he caused the Gymnasium, or place of exercise, in which they were assembled, to be invested by his foreign troops, and put them all to the sword.

When Julius Caesar, B. C. 48, in his pursuit of Pompey, landed at Alexandria, he found the city in great commotion, without law and without government. Having arbitrated between Ptolemy XII. and Cleopatra, and decreed that they should reign jointly in Egypt, Pothinus instigated the Alexandrians to resist the decree, and to concur in driving Caesar out of the city. Accordingly he brought 20,000 troops to effect his purpose, but Caesar supported the attack; and in order to prevent any injury from their fleet, to which they next had recourse, he caused it to be set on fire, and possessed himself of the tower of Pharos, which he garrisoned. Some of the vessels that were on fire came so near, that the flames caught the houses adjoining to the quay, and spread through that quarter of the city which was called Bruchion, and consumed the library that was placed there, consisting of 400,000 volumes. In a decisive battle with the whole army of Ptolemy, Caesar, assisted by a considerable body of Jews, obtained a complete victory. Ptolemy, in endeavouring to make his escape in a boat, was drowned in the Nile; and Caesar returned to Alexandria. Before he left this city he confirmed all the privileges which the Jews enjoyed, in gratitude to them for their assistance, and ordered a column to be erected, in which these privileges were engraven, with the decree that confirmed them. The emperor Caligula was inclined to favour the Alexandrians, because they manifested a readiness to confer divine honours on him; and conceived the horrid design of massacring the chief senators and knights of Rome, A. D. 40, and then of abandoning the city, and of settling at Alexandria. At this time the Jews who inhabited this city, and who had continued to enjoy the privileges of citizens, granted to them by Alexander, under the Ptolemies, and who had obtained a confirmation of them from Julius Caesar, became obnoxious to the Alexandrians. Their number amounted in the whole of Egypt to a million. The prerogatives that distinguished them, excited envy and jealousy,

and their fellow-citizens wanted only a pretence for destroying them. They had been for some time restrained from doing them injury; but under the government of Flaccus, A. D. 40, who permitted the statues of Cæsar to be set up in the oratories of the Jews, they were grievously oppressed. He took occasion, in consequence of some dissensions and seditions that occurred, to publish a decree, by which, without offering them a hearing, they were declared strangers in Alexandria; he also restricted them to one of the five districts into which the city was divided; and their houses, which they were compelled to abandon, were plundered: whilst, destitute of any settled abode, they were obliged to wander about the fields and the sea-shore, without shelter, property, or even the means of subsistence. Those who fell into the hands of their enemies were destroyed by a lingering and painful death. The streets, market-places, and theatres were deluged with blood; neither sex nor age was distinguished; and none, says Philo, *Leg. ad Caium*, were spared. This writer assigns no other cause for these barbarities than the rage and fury of the Alexandrians. When Flaccus was recalled, the Jews obtained some respite; but they were soon alarmed by the order of Caius to have his own statue set up in the temple of Jerusalem. In the mean while they sent a deputation to the emperor, at the head of which was Philo, to petition the restoration of their citizenship and of their oratories. Before the object of their embassy was settled, Caius died; and Claudius declared in favour of the Jews, whom he re-established in the possession of all the privileges they had enjoyed in Alexandria from the time of the foundation of that city. When Adrian visited Egypt, A. D. 130, he expressed a great dislike of the manners and dispositions of the Egyptians in general, and of those of the inhabitants of Alexandria in particular. In a letter written from thence, and addressed to the consul Servian, he says, ‘the city of Alexandria is rich and powerful, with great trade, which produces plenty. Nobody is idle there; some blow glass, others make paper; many are employed about linen and making of clothes; all have some trade. All, whether Jews or Christians, acknowledge but one God. I wish that this city, by its grandeur and riches the first of all Egypt, was furnished with better inhabitants.

For Nero the Alexandrians built baths in the city, when they expected a visit from him in his way to Egypt; and because Cæcina Tuscus, the son of his nurse, whom he had made prefect of Egypt, presumed to make use of them, he was condemned to banishment. To Alexandria belonged the honour of being the first place where Vespasian was acknowledged and proclaimed, A. D. 69, and the emperor remained here whilst his generals and armies were fighting against Vitellius; and though he came hither for the purpose of starving Italy, by preventing its supplies of foreign corn, yet as soon as he heard of the death of Vitellius, and that Rome had submitted, the best ships of Alexandria were immediately laden with corn, and ordered to sail for their supply. While Vespasian continued in this city, he received ambassadors from the Vol-

geses, who offered him 40,000 Parthian horse; but peace was then restored to the Roman empire. The emperor Severus, in his visit to Egypt, A. D. 202, granted the Alexandrians a council, the members of which had the title and privileges of senators, and assisted in the administration of public affairs, and thus mitigated the rigour of the despotic government of the prefect instituted by Augustus. He also changed several laws in their favour; and they erected a column as a monument of their gratitude, called by Abulfeda the Pillar of Severus. Caracalla, whose vanity they ridiculed, because, though of small stature, deformed, and destitute of military merit, he had compared himself to Achilles and to Alexander, is said to have conceived an irreconcileable dislike to the Alexandrians. Whilst they were preparing to receive him with joy and magnificence, when he visited the temple of Serapis, and the tomb of Alexander, he was meditating cruel retaliation. In the midst of peace, and on the slightest provocation, he issued his commands for a general massacre, A. D. 215. From a secure part of the temple of Serapis, he viewed and directed the slaughter of many thousand citizens, as well as strangers, without distinguishing either the number or the crime of the sufferers; since, as he coolly informed the senate, all the Alexandrians, those who had perished and those who had escaped, were alike guilty. Dion., lib. lxxvii. p. 1307, represents it as a cruel massacre; Herodian, lib. iv. p. 155, says, that it was also perfidious. The massacre was accompanied with the plunder both of temples and houses; and all strangers, except merchants, were driven from the city.—The societies of learned men, who were maintained in the Museum, were abolished; and the different quarters of the city were separated from each other, by walls and towers to prevent all communication between them. Caracalla, however, being soon after killed, Alexandria recovered its splendour, and became again the second city of the empire. Under the reign of Gallienus, Æmilian, who had been prefect of Egypt for some years, assumed the imperial purple, on occasion of a violent sedition, which terminated in a ruinous war. All communication between the different quarters of Alexandria was cut off, and it was easier, says St. Dionysius, to go from one end of the world to the other than from Alexandria to Alexandria. The streets were filled with blood, the dead bodies putrefied, and by their infection brought on the plague.—Æmilian, in vain, endeavoured to appease the people. They were exasperated against him, and attacked him with stones and darts; upon which, in order to avert the imminent danger that threatened him, he declared himself emperor.—The soldiers and the people, happy in the prospect of being rescued from the yoke of Gallienus, acknowledged his sovereign authority. At length he was attacked and defeated by Theodosius, the minister of Gallienus's vengeance.—Upon this he retired to the Bruchium, a quarter of Alexandria, and sustained a siege, in which Anatolius and St. Eusebius, intimate friends, and afterwards bishops of Laodicea, were admired for their ingenuous charity in comforting

and relieving the unhappy besieged, who perished with hunger. Anatolius was shut up in Bruchium, and Eusebius remained with the Romans. The former, moved with compassion to the wants and misery of the besieged, applied to the latter in order to obtain amnesty for those who should leave the garrison and surrender themselves. Having succeeded in his application, he immediately proposed surrendering the place, and making peace with the besiegers. The answer was, that no peace should be made. Anatolius then proposed, that all who were of no service should leave the place in disguise, and they were kindly received and seasonably supplied by Eusebius. Amilius was afterwards taken by Theodosius and sent to Gallienus, who ordered him to be strangled in prison. The various misfortunes that befel Alexandria so depopulated this great city, that, after these calamities, the number of its inhabitants, from four to fourscore years of age, was not equal to that which had been usually reckoned before of those who were between forty and seventy.— This difference was known by the registers that were kept for the gratuitous distribution of corn. Eusebius, Eccl. Hist. vii. 21. Dioclesian, A. D. 296, marched against Achilleus, who had usurped the government of Egypt, and, having driven him to Alexandria, besieged the city, cut off the aqueducts which conveyed the waters of the Nile into every quarter of that immense city, and rendering his camp impregnable to the sallies of the besieged multitude, he pushed his reiterated attacks with caution and vigour. After a siege of eight months, Alexandria, wasted by the sword and by fire, implored the clemency of the conqueror, but it experienced the full extent of his severity. Many thousands of the citizens perished in a promiscuous slaughter, and there were few obnoxious persons in Egypt, who escaped a sentence either of death, or at least of exile. Eutropius, ix. 24. Orosius, vii. 25, says, that he gave up the city to be plundered.— As an apology for the severity of this emperor, it has been alleged that the seditions of Alexandria had often affected the tranquillity and subsistence of Rome itself, and that his severity was counterbalanced by salutary regulations.— In 302, he established, for the benefit of this city, a perpetual distribution of corn. Constantine, with a view of establishing his new city of Constantinople, distributed every day 80,000 bushels of corn brought from Alexandria; and he employed the Alexandrian fleet in victualling New Rome, as it was called, leaving to Old Rome only that of Africa. Socrat. ii. 13.— Alexandria suffered in common with other places by the violent and destructive earthquake which shook the greatest part of the Roman empire, July 21st, A. D. 365; and this city annually commemorated this fatal day, when 50,000 persons had lost their lives in the inundation.

It was in Alexandria chiefly that the Grecian philosophy was engrrafted upon the stock of ancient oriental wisdom. The Egyptian method of teaching by allegory was peculiarly favourable to such an union. This influence of the Grecian upon the oriental philosophy continued long after the time of Alexander, and was one principal

occasion of the confusion of opinions which occurs in the history of the Alexandrian and Christian schools. Alexander, when he built the city with a determination to make it the seat of his empire, opened a new mart of philosophy, which emulated the fame of Athens itself. A general indulgence was granted to the promiscuous crowd assembled in this rising city whether Egyptians, Grecians, Jews, or others, to profess their respective systems of philosophy without molestation. The consequence was, that Egypt was soon filled with religious and philosophical sectaries of every kind; and particularly, that almost every Grecian sect found an advocate and professor in Alexandria. The family of the Ptolemies, as we have seen, who obtained the government of Egypt after Alexander, from motives of policy, encouraged this new establishment. Ptolemy Lagus, who had obtained the crown of Egypt by usurpation, invited people from every part of Greece to settle in Egypt, and removed the schools of Athens to Alexandria. This enlightened prince spared no pains to raise the literary, as well as the civil, military, and commercial credit of his country. Under the patronage first of the Egyptian princes, and afterwards of the Roman emperors, Alexandria long continued to enjoy great celebrity as the seat of learning, and to send forth eminent philosophers of every sect to distant countries. It remained a school of learning, as well as a commercial emporium, till it was taken, as we shall see in the sequel of this article, and plundered of its literary treasures by the Saracens. Philosophy, during this period, suffered a grievous corruption from the attempt which was made by philosophers of different sects and countries, Grecian, Egyptian, and oriental, who were assembled in Alexandria, to frame, from their different tenets, one general system of opinions. The respect which had long been universally paid to the schools of Greece, and the honours with which they were now adorned by the Egyptian princes, induced other wise men, and even the Egyptian priests and philosophers themselves, to submit to this innovation. Hence arose an heterogeneous mass of opinions, under the name of Eclectic philosophy, and which has been the foundation of endless confusion, error, and absurdity, not only in the Alexandrian school, but among Jews and Christians; producing among the former that specious kind of philosophy, which they called their Cabbala, and among the latter innumerable corruptions of the Christian faith. The Alexandrian school is celebrated by Strabo, lib. xvii.; and by Ammianus, xxii. 6. *Brucker's History of Philosophy, by Enfield*, vol. i. p. 500.

At Alexandria there was, in a very early period of the Christian era, a Christian school of considerable eminence. St. Jerome says, the school at Alexandria had been in being from the time of St. Mark. Pantenus, placed by Lardner at the year 192, presided in it. St. Clement of Alexandria succeeded Pantenus in this school about the year 190; and he was succeeded by Origen. Lardner's Works, vol. ii. p. 203. The theological system of Plato was introduced into both the philosophical and Christian schools of Alexandria; and many of his sentiments and ex-

pressions blended with the opinions and language of the professors.

In the year 638, Amrou, the general of Omar, invaded Egypt; and in the following year he commenced the siege of Alexandria. This siege is perhaps the most arduous and important enterprise in the annals of Saracen conquests. The first trading city in the world was abundantly replenished with the means of subsistence and defence. Her numerous inhabitants fought for the dearest of human rights, religion and property. The sea was continually open; and if Heraclius had been awake to the public distress, fresh armies of Romans and barbarians might have been poured into the harbour, to save the second capital of the empire. A circumference of ten miles would have scattered the forces of the Greeks, and favoured the stratagems of an active enemy; but the two sides of an oblong square were covered by the sea and the lake Mareotis, and each of the narrow ends exposed a front of no more than ten furlongs. The efforts of the Arabs, however, were not inadequate to the difficulty of the attempt. The faithful natives devoted their labours to the services of Amrou; and in every attack his sword and banner glittered in the van of the Moslems. The general, having been released from a temporary captivity, into which his imprudent valour had betrayed him, advanced towards the city doomed to destruction. At length, after a siege of fourteen months, and the loss of 23,000 men, the Saracens prevailed; the Greeks embarked their dispirited and diminished numbers; and the standard of Mahomet was planted on the walls of the capital of Egypt, December 22, A.D. 640. 'I have taken,' said Amrou to the caliph, 'the great city of the west. It is impossible for me to enumerate the variety of its riches and beauty; I shall content myself with observing, that it contains 4000 palaces, 4000 baths, 400 theatres, or places of amusement, 12,000 shops for the sale of vegetable foods, and 40,000 tributary Jews. The town has been subdued by force of arms, without treaty or capitulation, and the Moslems are impatient to see the fruits of their victory.' According to the Arabian historians, Alexandria, at this time, consisted of three cities, viz. Menna, or the port, which included Pharos and the adjacent parts; Alexandria, properly so called, where the modern Scanderia stands; and Nekita, or the Necropolis of Josephus and Strabo.

The intelligence of this disgraceful and calamitous event afflicted the declining health of the emperor, and Heraclius died of a dropsy about seven weeks after the loss of Alexandria. Under the minority of his grandson, the clamours of a people deprived of their daily sustenance, compelled the Byzantine court to undertake the recovery of the capital of Egypt. In the space of four years the harbour and fortifications of Alexandria were twice occupied by a fleet and army of Romans; who were twice expelled by the valour of Amrou. But the facility of the attempt, the repetition of the insult, and the obstinacy of the resistance, provoked him to swear, that if a third time he drove the infidels into the sea, he would render Alexandria as accessible on

all sides as the house of a prostitute. Faithful to his promise, he dismantled several parts of the walls and towers, but the people were spared; and the mosque of mercy was erected on the spot where the victorious general stopped the fury of his troops. For the fate of the library, see ALEXANDRIAN LIBRARY.

Under the domination of the Arabs, Alexandria gradually lost its splendour. In the year 924 it was taken by the Magrebians, two years after the destruction by fire of its great church, called by the Arabs, Al Kaisaria, or Cæsarea, which had been formerly a Pagan temple, erected by queen Cleopatra, in honour of Saturn. The city was soon abandoned by the Magrebians, and in 928 the possession of it was again resumed. But when their fleet was afterwards defeated by that of the Caliph, the Magrebian general, Abul Kasem, retired from Alexandria, leaving in it a garrison of 300 men, who, with the remaining inhabitants, were removed by the Caliph's admiral, Thmaal, to an island in the Nile, called Aboukir. According to Eutychius, more than 200,000 of the wretched inhabitants perished this year.

In the year 875 the old walls had been demolished; its extent contracted to half its ancient dimensions, and those walls were built which exist at the present day. This second Alexandria, which may be called, says Savary, that of the Arabs, presented, by the disposition of its streets, the form of a chequer. It had preserved a part of its public places and of its monuments. The pharos still existed; and Alexandria, in its decline, still presented an air of grandeur and magnificence that excited admiration.

The dominion of the Turks, and the discovery of the Cape of Good Hope, in 1499, however, completed its ruin, and from that time it has fallen into decay. Its large buildings fell into ruins; and, under a government which discouraged even the appearance of wealth, no person could venture to repair them.

The present state of Alexandria affords a scene of magnificent ruin and desolation. It is divided into the new and old town; the latter of which is incomparably the most extensive. It is partly enclosed within walls, which are evidently of Saracenic structure, of great thickness and solidity, and flanked by a hundred towers. They are supposed, by Dr. Pocock, to have been built in 1212, by one of the successors of Saladin, who employed in them the wreck of the ancient city. Part of them is composed, in a singular manner, of a species of shelly concretions, so cemented together as to appear a simple composition. These walls are two French leagues, or nearly six miles in circumference; but the space which they enclose, forms only a small part of the ancient city of the Ptolemies, whose ruins can be distinctly traced over more than three times that circuit. Even of the enclosure within the walls, by much the greater part is composed of ruins. No traveller has described, in so lively a manner as Volney, the aspect of ancient Alexandria. 'In our country,' says he, 'ruins are an object of curiosity. Scarcely can we discover, in unfrequented places, some ancient

castle, whose decay announces rather the deserton of its master, than the wretchedness of the neighbourhood. In Alexandria, on the contrary, we no sooner leave the new town, than we are astonished at the sight of an immense extent of ground overspread with ruins. The earth is covered with the remains of lofty buildings destroyed; whole fronts crumbled down, roofs fallen in, battlements decayed, and the stones disfigured and corroded by saltpetre. The traveller passes over a vast plain, furrowed with trenches, pierced with wells, divided by walls in ruins, covered over with ancient columns and modern tombs, amid palm trees and nopalos, and where no living creature is to be met with, but owls, bats, and jackals. The inhabitants, accustomed to this scene, behold it without emotion; but the stranger, in whom the recollection of ancient ages is revived by the novelty of the objects around him, feels a sensation, which not unfrequently dissolves him into tears, inspiring reflections which fill his heart with sadness, while his soul is elevated by their sublimity.

Amid this total wreck of ancient grandeur, a few objects only rise distinguishable through the surrounding desolation. Of these, the most remarkable by far is that called 'Pompey's Pillar.' All travellers have been struck with the loftiness and grandeur of this monument. Norden considers it as the finest column that the Corinthian order has ever produced, and Sonnini reckons it superior to any in the world. The height has been estimated at 117 feet, but appears, by more careful measurements, not to exceed ninety-four or ninety-five. It is composed of three pieces of the finest granite, one of which serves for the pedestal, the other for the shaft, and the third for the capital. The mean diameter is seven feet nine inches, so that the entire contents of the column may be estimated at 6000 feet. It is uninjured, unless in the pedestal and some part of the bottom of the shaft. Denon conceives the body of the column to be much the finest part of it; the capital, and still more the pedestal, he represents as of inferior workmanship. The name expresses the general belief, that it was erected by Cæsar, to commemorate his victory over Pompey; but this derivation seems very uncertain; and the opinions respecting its origin and date are exceedingly various. Denon imagines, that it formed only part of a more extensive building, the traces of which, in its vicinity, appeared to him distinctly visible.

In the space of two leagues enclosed by walls, nothing is to be seen but the remains of pilasters, of capitals, and of obelisks, and of whole mountains of shattered columns and monuments of ancient art, heaped one upon another, and accumulated to a greater height than that of the houses. The famous tower of Pharos has been long since demolished, and a square castle, without taste, ornament, or strength, called Farillon, erected in its place. The mole which joined the continent to the isle of Pharos is enlarged, and is now become a part of the main land. The island of Anti-Rhodes is in the middle of the present town, and is discoverable only by an eminence covered with ruins. The harbour Kibotos is choked up. The canal which conveyed

the waters of Mareotis has disappeared. This lake itself, through the negligence of the Turks in preserving the canals which conveyed the waters of the Nile, is no longer in existence, but is entirely occupied by the sands of Lybia. The canal of Faoué, the only one which at present communicates with Alexandria, and without which that town could not subsist, since it has not a drop of fresh water, is half filled with mud and sand. Under the Roman empire, and even under the domination of the Arabs, it was navigable all the year, and served for the conveyance of merchandize. Its banks were shaded with date trees, covered with vineyards, and adorned with country houses. At present it has no water till about the end of August, and its supply is hardly sufficient to fill the cisterns of the town. The fields adjoining to it are deserted; the groves and gardens which surrounded the ancient city have disappeared, and without the walls there are only a few scattered trees, some sycamores and fig trees, some date and caper trees, and kali, that hide the burning sands, which would be otherwise insupportable to the sight. Nevertheless, every trace of ancient magnificence is not obliterated. Some parts of the old walls are yet standing; and they are flanked with large towers, at the distance of about 200 paces from each other, and with smaller intermediate ones. Below are magnificent casemates, which may serve for galleries in which to walk. In the lower part of the towers is a large square hall, whose roof is supported by thick columns of Thebaic stone; and above this are several rooms, over which are platforms more than twenty paces square. The reservoirs, vaulted with much art, and extending under the whole town, are almost entire at the end of 2000 years. Of Cæsar's palace there remain only a few porphyry pillars, and the front, which is almost entire, and appears very beautiful. The palace of Cleopatra was built upon the walls facing the port, having a gallery on the outside, supported by several fine columns. Towards the eastern part of the palace are two obelisks, vulgarly called Cleopatra's Needles. They are of Thebaic stone, and covered with hieroglyphics; one is overturned, broken, and lying under the sand; the other is on its pedestal. These two obelisks, each of them of a single stone, are about sixty feet high, by seven feet square at the base. Towards the gate of Rosetta are five columns of marble, on the place formerly occupied by the porticoes of the Gymnasium. The rest of the colonade, the design of which was discoverable 100 years ago by Maillet, has been since destroyed by the barbarism of the Turks. The canal of the Nile, already mentioned, is about seventy paces from Pompey's pillar; and on the top of the hill is a tower, in which a sentinel is placed, who gives notice by a flag, of the ships, that are coming into port. On the sea-coast there is a large basin, cut out of the rock that forms the shore, having on its sides two beautiful saloons that are hewn out by the chissel, with benches across them. A canal of a zig-zag form, for the purpose of stopping the progress of the sand by its different windings, conveys into them the water of the sea, pure and transparent as crystal. The water

rises a little above the waist, when a person is seated on the stone bench, and the feet rest on a fine sand. The waves of the sea dash against the rock, and foam in the canal. The swell enters, raises you up, and leaves you; and thus alternately entering and retiring, furnishes a constant supply of fresh water, and a coolness, which is grateful and delicious under a burning sky. This place is vulgarly called the Bath of Cleopatra; and some ruins indicate its having been formerly ornamented.

A more useful, and even more magnificent labour, consisted in the reservoirs with which ancient Alexandria was supplied with water. The construction of these excavated the whole ground upon which that city stood. A conduit, communicating with the canal of Cleopatra, extended the whole length of the city. When this was judged to be filled with the overflows of the Nile, the chiefs of the city went in great ceremony to open it, and admit the water into the cisterns. These reservoirs, which were formerly very numerous, are now reduced to half a dozen, which however are sufficient for the reduced consumption of the city.

The catacombs are a still more extraordinary monument; they begin at the extremity of the old city, and extend some distance along the coast, forming what was called the Necropolis, or city of the dead. They consist of small sepulchral grottoes, cut in the rock. The interior of the galleries is plastered by mortar. Most of these cavities have been the subject of discovery, and each has been found to contain three coffins piled over each other. The Arabs report, that there is a subterraneous communication between this quarter and the ancient city of Memphis; but this statement seems to require confirmation.

The modern Alexandria is built near the brink of the sea, on a kind of peninsula, situate between the two ports above mentioned. The new port assigned to Europeans, is clogged up with sand, which renders the entrance into it both difficult and dangerous, and, in the stormy weather, endangers the bulging of the ships; and the bottom is rocky, so that the cables soon chafe and part; and thus vessels are frequently driven against one another, and are sometimes lost. An instance of this happened in March, 1773, when more than forty vessels were dashed to pieces on the mole by a northwest gale. Similar accidents have also happened at different times; and under the Turkish government, which, as it is said, ruins the labours of past ages, and destroys the hopes of future time, no provision is likely to be made for preventing their occurring again. The other port, or the Eunostus of the ancients, to the westward of the Pharos, is called the port of Africa; it is much larger than the former, and lies immediately under part of the town of Alexandria. The new Alexandria, even in its state of decay, is still to Europeans the most interesting of the cities of Egypt. It is built chiefly along the coast, and occupies only a small portion of the space enclosed within the Saracenic walls. Alexandria, says a modern traveller, now exhibits very few marks by which it could be recognised as one of the principal monuments of the magnificence of

the conqueror of Asia. Its houses, like all those of the Levant, have flat terraced roofs; the place of windows is supplied by apertures which themselves are almost entirely obstructed by a projecting wooden lattice, through which the light can scarcely penetrate. The streets, narrow and awkwardly disposed, have neither pavement nor police; the eye of the traveller is arrested by no public nor private edifice; and but for the ruins of the old city, there would be nothing to attract a moment's attention.

The population of modern Alexandria has been variously estimated. Some have carried it so high as 20,000, while others assert that the stationary numbers cannot exceed 5000; in addition to which, however, there is a continual resort of strangers from all quarters of the world. The basis of the population consists of Turks, Copts, and Jews. The Turks compose the officers of government and the garrison; the rest are chiefly artizans and shopkeepers, in easy circumstances, but few of whom carry on any extensive trade. The Copts are numerous, but held in contempt; a few of them only have acquired some wealth by commerce. But the mercantile transactions of Alexandria are almost entirely in the hands of the Jews. Although they pay a higher per centage to the custom-house than the European merchants, they yet find means to sell their goods cheaper. The customs being let in farm every two years, they agree with the farmer for a composition, which he is obliged to make favourable, otherwise the Jews would delay the greater part of their importations, till the end of his period. There are about twelve great Jew-merchants in Alexandria, who exercise a species of sovereignty over their countrymen, both by the extent of their capital and commercial transactions, and by becoming umpires in their disputes.

The commerce of Alexandria is still not inconsiderable; since it includes all which the European states carry on with Egypt. It was at first nearly monopolized by the Venetians and Genoese; but after the discovery of the Cape of Good Hope, their establishments rapidly declined, and fell at last into a state of total bankruptcy. The whole trade then fell into the hands of the French and the English. The former, previous to the revolution and the late war, carried it on to the greatest extent, and had a considerable number of merchants residing there. The approach to Alexandria from the west is attended with considerable difficulty, the Lybian shore being completely a dead flat, presenting no object that is perceptible at the smallest distance. A vessel, which has this shore to leeward, must keep a strict watch, as there is neither port nor road to afford any shelter. The first land-mark consists in two eminences, with a tower on each, called Aboukir, or by Europeans the Tower of the Arabs. The immediate approach to Alexandria is announced by the appearance of Pompey's pillar. There are two harbours, the old and the new. The former, though somewhat difficult of entrance, is safe, and affords sufficient depth of water. Unfortunately, it is considered too sacred to be entered by any but the disciples of

Mahomet. Christians are obliged to content themselves with the new harbour, which is shallow, has a rocky bottom, and is exposed to the north wind, which often blows with great violence.

Volney describes Alexandria as wholly unable to resist any attack; and, accordingly, on the landing of the French, it surrendered without striking a blow. They seem, however, to have been industrious in placing it in a state of defence, and so far succeeded, that the English, in 1801, after gaining two victories in front of it, did not venture to attack the city, but turned their arms against Cairo, the reduction of which led to the general evacuation of Egypt. Alexandria, however, was taken by the English in 1806, without difficulty, though it did not remain long in their possession. Long. $30^{\circ} 5' E.$ Lat. $31^{\circ} 16' N.$

The language spoken at Alexandria is the Arabic; but most of the Alexandrians, and those in particular whom commerce leads into an intercourse with the merchants of Europe, speak likewise the Italian. The moresco or lingua franca, which is a compound of bad Italian, Spanish, and Arabic, is likewise spoken in this place. The government of Alexandria is like that of other places in Egypt; and is conducted by an aga, who has under him a kadi and sub-basha, all nominated by the chief basha. It has a small garrison of soldiers, part of which are Janissaries and Assiffs; who are haughty and insolent, not only to strangers, but to the mercantile and industrious part of the people. These are lodged in the farillons or castles that guard the port, where the aga or governor that commands them also resides. But though the Pharos, according to established regulations, ought to be garrisoned by 500 janissaries, it has never half that number; and not more than four canons for its defence. The whole of the fortifications might easily be beaten down by a single frigate; but a foreign army would experience great difficulty in maintaining possession of Alexandria for want of water. Alexandria was taken by assault on the fourth of July, 1798, by the French army under the command of Buonaparte, at that time prime consul of France; after putting to flight the Arabs and Mamelukes who defended it, and killing about 300 of them. The troops that were left in possession of the town, when the army began its march across the desert, having been forbidden, under penalty of death, from entering the houses or mosques of the Turks, or committing any violence on their persons, or those of their families, built huts of palm-branches without the city, to shelter themselves from the sun. The men of science, who accompanied the army, were lodged in the houses of the few Europeans resident at Alexandria; but a dozen of them were crowded together in one chamber, under the heat of a torrid climate. Miserably supplied both with food and water, molested with the stings of insects, and surrounded with filth and wretchedness, they at the same time contemplated, in a city once renowned for industry, commerce, and activity, nothing but ruins, barbarism, and poverty; stupid-looking citizens, with long pipes, indolently sitting in the public places; half starved

and naked children, and the forms of bare-footed women, in blue serge gowns, and black stuff veils, flying the approach, or turning away with precipitation, whenever they met a Frenchman. The French beheld every where monuments of antiquity, but every where misplaced; pillars of granite, inscribed with Egyptian hieroglyphics, strewed the streets, or divided by the saw, served for their holds and benches; marble and porphyry bases and capitals, baths and catacombs, were found in ruins, with nothing entire but a bath of black granite, destined for the museum of Paris; the pillar of Pompey, and the obelisk of Cleopatra, which were yet in good preservation.

The christian zeal against all the idols of the heathen world was exercised so unsparingly at Alexandria, at the close of the fourth century, as to produce the greatest public disorders. The temple of Serapis was converted into a church to the honour of the martyrs; and over the tomb of Alexander, a christian church is said to have been erected to the memory of St. Athanasius, that distinguished relic itself being converted into a cistern. On the conquest of Alexandria, by the Saracens, happily, as Dr. Clarke thinks, for the identity of this monument, the church only changed its name for the mosque of St. Athanasius: and the fame of the founder of this city, throughout the eastern world, was naturally transferred to his tomb. Celebrated in many eastern writings, as ‘the lord of the two ends o the world,’ ‘the king of kings,’ &c.; for ages reverenced as a god by the Egyptians, and spoken of with distinction in the Koran, the veneration now paid to this relic of Alexander, seems to have been uninterrupted for centuries Benjamin, of Toledo, a Spanish Jew, who visited Alexandria in the thirteenth century, speaks of ‘a marble sepulchre, on which were sculptured all sorts of birds, and other animals, with an inscription of the ancients which no one can read.’ but ‘they have a conjecture,’ he adds, ‘that some king, before the deluge, was buried there; the length of which sepulchre was fifteen spans, the breadth six.’ Johannes Leo, in 1491, expressly mentions ‘a small edifice, built like a chapel, worthy of notice, on account of a remarkable tomb, held in high honour by the Mahomedans; in which sepulchre, they assert, is interred the body of Alexander the Great, an eminent prophet and king, as they read in the Koran.’ We now trace it through the testimony of Marmol, the Spaniard; Jahai Ben Abdallatiff (1270); Sir George Sandys, in 1611; the reports and enquiries of Dr. Pococke, in 1743 Irwin, Sonnini, Brown, and Denon. Through a period of upwards of 2000 years, it is thus attempted to be shown, that the shrine of the son of Ammon has survived himself. Several objections are still taken by antiquaries, however, against the conclusions of our enterprising traveller: that there should not be a single Greek inscription on this alleged tomb of the greatest of the Greeks: that Eutychius, who composed, at Alexandria ‘Annals of that City in the Tenth Century,’ should mention the body of Alexander being brought here, without stating, that his tomb remained: the silence of

Furer, Boucher, Vansleb, and Niebhuer, are circumstances that have been thought to weigh strongly against its claims; but, in conformity with our general principle, of furnishing an impartial record of such opinions (and, because, we are rather among the unbelievers, than the converts, of Dr. C.'s arguments, we have given them the more fully,) we have now placed the whole of this interesting enquiry before the reader; and must leave the decision upon the claims of this monument to the further light that may be thrown on its numerous hieroglyphics, and—himself.

When the blockade of the port, by the English fleet, after the famous battle of Aboukir, cut off the communication with Rosetta, and the supply of water was thus impeded, Buonaparte caused the canal, which led from Rhæmania to Alexandria, across a desert of forty miles, to be cleansed; by which means, not only this city received a larger supply of water and provisions, but the artillery was conveyed expeditiously and conveniently, by water, to the general deposit at Gisa. Buonaparte also drew plans for the better defence of the port of Alexandria, and the city of Cairo; formed a great establishment for the mechanical arts; and, with the concurrence of the scientific men who attended him, formed a national academy, called the Institute. In the year 1801 Alexandria was taken by the English army, under the command of general Hutchinson, the news of which was announced soon after the preliminaries of peace between England and France were signed, by the respective agents of the two countries; by one article of which, Egypt is to be delivered up to the Sublime Ottoman Porte. The symbols employed by the Alexandrians on their medals, were, the ibis, Hippopotamus, ears of corn, the lion, and others, which were common to the whole country, or to Africa.

A medal of Adrian represents Alexandria in the form of a woman, sitting on the ground, having, on her right side, and at her feet, ears of corn, and resting on a basket full of fruits.

Goltr. Nunn, Imperat.

Alexandria is situated in N. lat. 31°. 11'. 20". E. long. 30°. 16'. 30".—*Nautical Almanac*. According to Bruce's *Travels*, vol. i, p. 16, N. lat. 31°. 11'. 32". E. long. 30°. 17'. 30". *Anc. and Mod. Un. Hist.*, Rollin's *Anc. Hist.* Savary's *Letters on Egypt*, vol. i. letter 2. Sonnini's *Travels through Upper and Lower Egypt*. Gibbon's *Decline, &c. of the Rom. Emp.*

ALEXANDRIA was also a name given to several other cities, viz. a city of Arachosia, on the river Arachotus, the Alexandropolis of Isidore, (Stephanus); thought by some to be the modern Cabul:—another of Gedrosia, both built by order of Alexander the Great, Pliny, II. N. lib. vi. c. 23.—A third of Aria, near the lake Arius, according to Ptolemy; but, according to Pliny, lib. vi. c. 23, on the river Arius, built by Alexander, who settled a colony of Macedonians there, Strabo, lib. xv.; Ammianus, lib. 22.—A fourth in Bactriana, so called, according to Pliny, lib. vi. c. 23, from its builder.—A fifth, an inland town of Carmania, built by Alexander,

and mentioned by Ptolemy, Ammianus, and Pliny.—A sixth, in the country of the Dahæ, in Sogdiana, Isidorus Characenus.—A seventh, in India, at the confluence of the Acesines and Indus, Arrian, lib. v. c. 15.—An eighth, built by Alexander the Great, between Issus and the straits which lead from Cilicia into Syria, called also Alexandretta, and now Scanderoon.—A ninth, in Margiana, built by Alexander, and rebuilt (after it was demolished,) by Antiochus, the son of Seleucus, and hence called Antiochia of Syria; and also Seleucia, watered by the river Mergus; seventy stadia in circuit, according to Pliny, lib. vi. c. 16; who adds, that, after the defeat of Crassus, Orodes conveyed the captives to this place.—A tenth, of the Oxiana, in Sogdiana, built by Alexander, on the Oxus, near the confines of Bactria, Pliny, lib. vi. c. 16.—An eleventh, built by Alexander, at the foot of Mount Paropamisus, which was called Caucasus, Pliny, lib. vi. c. 23.—A twelfth, in Troas, called also Troas and Antigonia, built by Alexander, in commemoration of Troy; Antigonus, one of his lieutenants, laid the foundations of it, and gave his name to the city; but the name of Alexander was restored by Lysimachus, who afterwards embellished, and extended it. It became, under Augustus, one of the handsomest cities of the east. Under Adrian, Herodes Atticus constructed a superb aqueduct, some traces of which are still visible. The walls of the city, houses, temples, and other monuments, are built of a hard shelly stone. The marble of Paros, and that of Marmora, also several sorts of granite, are common here. Near the rivulet, to the south of the city, are two springs of mineral water, resorted to by the Turks and Greeks, recommended for disorders of the skin, the leprosy, and syphilis. The harbour, of narrow extent, is almost choked up with sand. History does not mention the epoch in which this city was destroyed; but it was before the Turks established themselves in this country. The environs present a fruitful soil, forming a plain, in which the velani oak grows without culture. The ruins of this city are six leagues to the south of Cape Sigaeum. Olivier's *Travels*, &c. vol. ii. p. 46.—A thirteenth, Alexandria, built by Alexander, on the Jaxartes, bounding his victories towards Scythia.—A fifteenth, in Adiabene, mentioned by Pliny; and, as Hardouin suggests, designed to perpetuate the remembrance of the defeat of Darius.—A sixteenth, on the northern coast of the island of Cyprus, south of the promontory of Callinusa.—A seventeenth, in Palestine, on the river Scham, and near the sea, to the south of Tyre.

ALEXANDRIA, or ALESSANDRIA, surnamed Della Paglia, because the inhabitants use stubble for fuel, instead of wood; or, because the Germans contemptuously called it Palearis, or a fortress of straw, a city of Italy, in the district of Alexandrin, or Alessandrino, belonging to the duchy of Milan. It has a castle, and is situated in a marshy country, on the river Tenaro. It was built in honour of pope Alexander III. in 1170, and is said to have 12,000 inhabitants. By this pope, it was made a bishopric, suffragan of Milan, with several privileges annexed. The

citadel is strong, but the fortifications are indifferent. It was ceded to the duke of Savoy, in 1703; taken by prince Eugene, after three days siege, 1706; by the French, in 1745; and retaken by the king of Sardinia, in 1746, to whom by the treaty of Utrecht it belongs. It is thirty-eight miles east of Turin, and thirty-seven south-south-west of Milan. N. lat. 44°. 48'. E. long. 8°. 39'.

ALEXANDRIA, in modern geography, the principal Russian settlement in the Aleutian islands, and the residence of the governor on the island of Kodiak. The harbour is excellent and capacious, being sheltered by several small islands lying to the south-west. Alexandria consists of about fifty houses built of logs, the rooms of which are caulked with moss, and covered with grass. This is the principal dépôt belonging to the Russian African company, and where the furs are collected. The town is called St. Paul by captain Lisiansky. It contains a church, a barrack for the Russian convicts, a school, and several store-houses belonging to the North-West Company.

ALEXANDRIA, in North America, a town of Virginia, on the south bank of the river Potowmack. The situation is elevated and pleasant, and the streets are laid out regularly upon the

plan of Philadelphia. It is situated 100 miles north from Richmond, and contains upwards of 300 houses, many of which are elegant. Its population is rapidly increasing. Long. 77°. 0'. W. Lat. 38°. 30'. N.

ALEXANDRIA, (Patriarch of,) in ecclesiastical history. See PATRIARCH.

ALEXANDRIAN, in a particular sense, is applied to all those who professed or taught the sciences in the school of Alexandria.

Thus, Clemens is called Alexandrinus, or the Alexandrian, though some say he was born at Athens: the same epithet is applied to Apion, born at Oasiss; and to Aristarchus, by birth a Samothracian. The chief Alexandrian philosophers were, Euclid, the famous geometer; the two ancient astronomers, Aristillus and Timocharis; Eratosthenes, Apollonius Pergaeus, Conon, Hipparchus, Ctesibius, Heron, Posidonius, Pappus, Theon, Hypatia, the daughter of Theon, Ptolemy; and Philoponus and Didymus, the last mathematicians of this school. To these, we may add, Ammonius, Plotinus, Origen, Porphyry, Janlichus, Sopater, Maximus, and Dexippus.

ALEXANDRIAN is more particularly understood of a college of priests, consecrated to the service of Alexander Severus, after his deification.

ALEXANDRIAN COPY.

ALEXANDRIAN Copy, is a manuscript, consisting of four volumes, in a large quarto, or rather folio size, containing the whole Bible in Greek, including the two Testaments and the Apocrypha. 'Of the few manuscripts known to be extant,' says an intelligent author, 'which contain the Greek scriptures, (that is the Old Testament according to the Septuagint version, and the New Testament;) there are two which pre-eminently demand the attention of the biblical student, for their antiquity and intrinsic value, viz.:—the Alexandrian manuscript which is preserved in the British Museum, and the Vatican manuscript, deposited in the library of the Vatican palace at Rome.'

The Codex Alexandrinus, noted by the letter A. in Wetstein's and Griesbach's critical editions of the New Testament, includes within the three first volumes the books of the old Testament and the Apocrypha. In the fourth volume are found, the New Testament, the first epistle of Clement to the Corinthians, and the Apocryphal Psalms ascribed to Solomon. In the New Testament are wanting the beginning as far as Matthew xxv. 6, *ο νυμφιος ερχεται*; likewise from John vi. 50, to viii. 52; and from 2 Cor. iv. 13, to xii. 7. The Psalms are preceded by the epistle of Athanasius to Marcellinus, and followed by a catalogue containing those which are to be used in a prayer for each hour, both of the day and the night; also by fourteen hymns, partly apochryphal, partly biblical, the eleventh of which is a hymn, in praise of the Virgin Mary, entitled *προσινχη Μαριας της Θεοτοκης*. The arguments of Eusebius

are annexed to the Psalms and his canons to the gospels.

This manuscript is now preserved in the British Museum, where it was deposited in 1753. It was sent as a present to king Charles I. from Cyrilus Lucaris, a native of Crete, and patriarch of Constantinople, by Sir Thomas Rowe, ambassador from England, to the grand seignior, in the year 1628. Cyrilus brought it with him from Alexandria, where, probably, it was written.

In a schedule, annexed to it, he gives this account: that it was written, as tradition informed him, by Thecla, a noble Egyptian lady, about thirteen hundred years ago, a little after the council of Nice. He adds, that the name of Thecla, at the end of the book, was erased; but that this was the case with other books of the Christians, after christianity was extinguished in Egypt by the Mahomedans: and that recent tradition records the fact of the laceration and erasure of Thecla's name. The proprietor of this manuscript, before it came into the hands of Cyrilus Lucaris, had written an Arabic subscription, expressing that this book was said to have been written with the pen of Thecla the martyr. Various disputes have arisen with regard to the place whence it was brought, and where it was written, to its antiquity, and of course, to its real value. Some critics have bestowed upon it the highest commendation, whilst it has been equally depreciated by others. Of its most strenuous adversaries, Wetstein seems to have been the principal. The place from

which it was sent to England was, without doubt, Alexandria, and hence it has been called Codex Alexandrinus. As to the place where it was written, there is a considerable difference of opinion. Matthæus Muttis, who was a cotemporary, friend, and deacon of Cyrilus, and who afterwards instructed in the Greek language John Rudolph Wetstein, uncle to the celebrated editor of the Greek Testament, bears testimony, in a letter written to Martin Bogdan, a physician in Bern, dated January 14, 1664, that it had been brought from one of the twenty-two monasteries in mount Athos, which the Turks never destroyed, but allowed to continue upon the payment of tribute. Dr. Woide endeavours to weaken the evidence of Muttis, and to render the testimony of the elder Wetstein suspicious: but Spohn, in his *Notitia Codicis Alexandrini*, p. 10—13, shews, that the objections of Woide are ungrounded. Allowing their reality, we cannot infer that Cyrilus found this manuscript in Alexandria. Before he went to Alexandria, he spent some time on Mount Athos, the repository and manufactory of manuscripts of the New Testament, whence a great number have been brought into the west of Europe, and a still greater number have been sent to Moscow. It is therefore probable, independently of the evidence of Muttis, that Cyrilus procured it there either by purchase or by present, took it with him to Alexandria, and brought it thence on his return to Constantinople. But the question recurs, where was this copy written? The Arabic subscription above cited clearly proves that it had been in Egypt, at some period or other, before it fell into the hands of Cyrilus. This subscription shews that it once belonged to an Egyptian, or that during some time it was preserved in Egypt, where Arabic has been spoken since the seventh century. Besides, it is well known that a great number of manuscripts of the Greek Bible have been written in Egypt. Woide has also pointed out a remarkable coincidence between the Cod. Alex. and the writings of the Copts. Michaelis alleges another circumstance as a probable argument of its having been written in Egypt. In Ezekiel xxvii. 18, both in the Hebrew and Greek text, the Tyrians are said to have fetched their wine from Chelbon, or, according to Bochart, Chalybon. But as Chalybon, though celebrated for its wine, was unknown to the writer of this manuscript, he has altered it by a fanciful conjecture to οινον εκ Χεβρων, wine from Hebron. This alteration was probably made by an Egyptian copyist, because Egypt was formerly supplied with wine from Hebron. The subscription, before mentioned, ascribes the writing of it to Thecla, an Egyptian lady of high rank, who could not have been, as Michaelis supposes, the martyress Thecla, placed in the time of St. Paul: but Woide replies that a distinction must be made between Thecla martyr, and Thecla proto-martyr.

With regard to these subscriptions we may observe, with a learned writer (Bp. Marsh), that the true state of the case appears to be as follows: ' Some centuries after the Codex Alexandrinus had been written, and the Greek subscriptions, and perhaps those other parts where it is more

VOL. I.

defective, already lost, it fell into the hands of a Christian inhabitant of Egypt, who, not finding the usual Greek subscription of the copyist, added in Arabic, his native language, the tradition, either true or false, which had been preserved in the family or families to which the manuscript had belonged, ' Memorant hunc codicem scriptum esse calamo Thecle martyris.' In the 17th century, when oral tradition respecting this manuscript had probably ceased, it became the property of Cyrus Lucaris; but whether in Alexandria, or Mount Athos, is of no importance to the present enquiry. On examining the manuscript, he finds that the Greek subscription is lost, but that there is a tradition recorded in Arabic by a former proprietor, which simply related that it was written by one Thecla a martyress, which is what he means by ' memoria et traditio recens.' Taking therefore upon trust, that one Thecla the martyress was really the copyist, he consults the annals of the church to discover in what age and country a person of this name and character existed, finds that an Egyptian lady of rank, called Thecla, suffered martyrdom between the time of holding the council of Nice, and the close of the fourth century; and concludes, without further ceremony, that she was the very identical copyist. Not satisfied with this discovery, he attempts to account for the loss of the Greek subscription, and ascribes it to the malice of the Saracens; being weak enough to believe that the enemies of Christianity would exert their vengeance on the name of a poor transcriber, and leave the four folio volumes themselves unhurt. Woide, who transcribed and published this manuscript, and must be better acquainted with it than any other person, asserts, that it was written by two different copyists; for he has observed a difference in the ink, and, which is of greater moment, even in the strokes of the letters. The conjecture of Oudin, adopted by Wetstein, that the manuscript was written by an Accemet is, in the judgment of Michaelis, worthy of attention, see *ACOEMETÆ*, and he adds, that this conjecture does not contradict the account that Thecla was the copyist, since there were not only monks but nuns of this order.

The antiquity of this manuscript has been also the subject of controversy. Grabe and Schulze think that it might have been written before the end of the fourth century, which, says Michaelis, is the very utmost period that can be allowed, because it contains the epistles of Athanasius. Oudin places it in the tenth century. Wetstein refers it to the fifth, and supposes that it was one of the manuscripts collected at Alexandria in 615, for the Syriac version. Dr. Semler refers it to the seventh century. Montfaucon is of opinion, that neither the Cod. Alex. nor any Greek manuscript, can be said with great probability to be much prior to the sixth century. Palæog. Greec. i. p. 185. Michaelis apprehends, that this manuscript was written after Arabic was become the native language of the Egyptians, that is, one, or rather two centuries after Alexandria was taken by the Saracens, which happened in the year 640, because the transcriber frequently confounds M. and B. which is often done in the Arabic: and

he concludes, that it is not more ancient than the eighth century. Woide, after a great display of learning (with which he examines the evidence for the antiquity of the Cod. Alex.) concludes, that it was written between the middle and the end of the fourth century. It cannot be allowed a greater antiquity, because it has not only the *πτλοι* or *κεφαλαια majora*, but the *κεφαλαια minora*, or Ammonian sections, accompanied with the references to the canons of Eusebius. Woide's arguments have been objected to by Spohn, in p. 42—109, of his edition of Woide's *Notitia Codicis Alexandrinii*. Some of the principal arguments advanced by those who refer this manuscript to the fourth or fifth centuries are : that the epistles of St. Paul are not divided into chapters like the gospels, though this division took place so early as 396, when to each chapter was prefixed a superscription. The Cod. Alex. has the epistles of Clement of Rome ; but these were forbidden to be read in the churches, by the council of Laodicea, in 364, and that of Carthage, in 419. Hence Schulze has inferred, that it was written before the year 364 ; and he produces a new argument for its antiquity, deduced from the last of the fourteen hymns found in it after the psalms, which is superscribed *ημνος εωθινος*, and is called the grand doxology ; for this hymn has not the clause *αγιος ο θεος, ηιος του χρυσος, αγιος αθανατος, ελεησον ημας*, which was used between the years 434 and 446 ; and therefore the manuscript must have been written before this time. Wetstein thinks that it must have been written before the time of Jerome, because the Greek text of this manuscript was altered from the old Italic. He adds, that the transcriber was ignorant that the Arabs were called Hagarenes, because he has written, 1 Chron. v. 20. *αγοραιοι* for *Αγαραιοι*. Others allege that *αγοραιοι* is a mere erratum ; because *Αγαραιων* occurs in the preceding verse, *Αγαρτης* in 1 Chron. xxvii. 31, and *Αγαρηνοι* in Ps. lxxxii. 7. These arguments, says Michaelis, afford no certainty, because the Cod. Alex. must have been copied from a still more ancient manuscript ; and, if this were faithfully copied, the arguments apply rather to this than to the Alexandrian manuscript itself. It is the hand-writing alone, or the formation of the letters, with the want of accents, which can lead to any probable decision. The arguments alleged to prove that it is not so ancient as the fourth century, are such as these. Dr. Semler thinks that the epistle of Athanasius, on the value and excellency of the Psalms, would hardly have been prefixed to them during his life. But it ought to be recollect ed, that Athanasius had many warm and strenuous advocates. From this epistle Oudin has attempted to deduce an argument, that the manuscript was written in the tenth century. This epistle, he says, is spurious, and could not have been forged during the life of Athanasius, and the tenth century was fertile in spurious productions. Again, the Virgin Mary, in the superscription of the song of the Blessed Virgin, is stiled *θεοροκτος*, a name which Wetstein says betrays the fifth century. Further, from the probable conjecture, that this manuscript was written by one of the order of the Acometæ, Oudin concludes against its antiquity ;

but Wetstein contents himself with asserting, that it could not have been written before the fifth century, because Alexander, who founded this order, lived about the year 420. From this statement, pursued more at large, Michaelis deduces a reason for paying less deference to the Cod. Alex. than many eminent critics have done, and for the preference that is due in many respects, to ancient versions, before any single manuscript, because the antiquity of the former, which is in general greater than that of the latter, can be determined with more precision.

The value of this manuscript has been differently appreciated by different writers. Wetstein, though he denotes it by Α, the first letter of the alphabet, is no great admirer of it, nor does Michaelis estimate it highly, either on account of its internal excellence or the value of its readings. The principal charge which has been produced against the Alexandrian manuscript, and which has been strongly urged by Wetstein, is its having been altered from the Latin version. It is incredible, says Michaelis, who once agreed in opinion with Wetstein, but found occasion to alter his sentiments, that a transcriber who lived in Egypt, should have altered the Greek text from a Latin version, because Egypt belonged to the Greek diocese, and Latin was not understood there. On this subject Woide has eminently displayed his critical abilities, and ably defended the Greek manuscripts in general, and the Codex Alexandrinus in particular, from the charge of having been corrupted from the Latin. Griesbach, in his *Symbola Criticae*, vol. i. p. 110—117, concurs with Woide ; and both have contributed to confirm Michaelis in his new opinion. If this manuscript has been corrupted from a version, it is more reasonable to suspect the Coptic, the version of the country, in which it was written. Griesbach has observed, that this manuscript follows three different editions : the Byzantine in the gospels, where its readings are of the least value ; the western edition in the Acts of the Apostles, and the Catholic Epistles, which form the middle division of this manuscript ; and the Alexandrian in the Epistles of St. Paul. The transcriber, if this assertion be true, must have copied the three parts of the Greek Testament from three different manuscripts, of three different editions. It is observable, that the readings of the Cod. Alex. coincide very frequently, not only with the Coptic and the old Syriac, but with the new Syriac and the Ethiopic ; and this circumstance favours the hypothesis, that the manuscript was written in Egypt, because the new Syriac version having been collated with Egyptian manuscripts of the Greek Testament, and the Ethiopic version being taken immediately from them, have necessarily the readings of the Alexandrian edition.

This manuscript has neither accents nor marks of aspirations ; it is written with capital, or as they are called, uncial letters ; and there are no intervals between the words, but the sense of a passage is sometimes terminated by a point, and sometimes by a vacant space. Although abbreviations are not very numerous, yet this manuscript abbreviates *ανθρωπος*, *δαβιδ*, *θεος*, *ημας*, *ισραηλ*, *κυριος*, *μητηρ*, *πατηρ*, *ερανος*, *πνευμα*, *σαν-*

ρος, σωτηρ, νιος, χριστος; and it has also other marks of abbreviation. Dr. Semler supposes, that the more ancient manuscripts from which the Cod. Alex. was copied, had a much greater number; from a false method of decyphering which marks, he explains many errors committed by the copyist of the latter. (See note thirty-three to Wetstein's Prolegomena). Of these abbreviations, and the points annexed to certain letters, which before appeared unintelligible; and of the large initial letters, which are sometimes placed in a very extraordinary manner; and of other particulars, an account may be seen in Woide's Preface, who has given an accurate description of the manuscript in general. No manuscript has been more frequently and more accurately collated; and it was supposed, that the last extracts, made by Wetstein, would have rendered future labours of this kind superfluous; but Woide informs us, that Wetstein is chargeable with several omissions and errors, and has admitted into his collection of readings the mistakes of Mill. We are now in possession of a perfect impression of this manuscript, accompanied with so complete and so critical a collection of various readings, as is hardly to be expected from the edition of any other manuscript. Dr Woide, principal librarian of the British Museum, published it in 1786, with types cast for the purpose, line for line, without intervals between the words, as in the manuscript itself: the copy, whose title is 'Novum Testamentum Graecum ex Codice MS. Alexandrino qui Londini in Bibliotheca Musei Britanici asservatur descriptum. Alarolo Godofredo

Woide. Londini exprelo Joannis Nichols Typis Jacksonianis MDCCCLXXXVI,' is so perfect a resemblance of the original, that it may supply its place. It is a very splendid folio. Twelve copies were printed on vellum. The fac-simile itself fills 260 pages, and the preface, comprising twenty-two pages, contains an excellent description of the manuscript. It is illustrated by an engraving which represents the style of writing in various manuscripts; to this is subjoined an exact list of all its various readings, in eighty-nine pages, and each reading is accompanied with a remark, giving an account of what his predecessors, Junius (i. e. Patrick Young), Bishop Walton, Doctors Mill, and Grabe, and Wetstein, had performed or neglected. To complete this work, however, the following should be added:—Appendix ad editionem Novi Testamenti Graeci, e Codice Alexandrino descripti a C. G. Woide, in qua continentur Fragmenta Novi Testamenti juxta interpretationem dialecti superioris Aegypti que Thebaica vel Sahidica appellatur, e Codd. Oxoniens. maxima ex parte desumpta cum dissertatione de Versione Bibliorum Aegyptiacarum, quibus subjicitur Codicis Vaticani collatio. Oxonii: E. Typographo Clarendoniano, 1799, folio. This work was edited by the Rev. Dr. Ford. The following specimen of the first seven verses of St. John's Gospel, will convey to the reader an idea of this manuscript; and we have to acknowledge the politeness of the Rev. T. H. Horne, in favouring us with his types, taken from those of the Rev. H. Baber, on this occasion.

FAC-SIMILE OF THE ALEXANDRIAN MANUSCRIPT.

In 1812 the Rev. H. H. Baber, one of the librarians of the British Museum, published, by subscription, a fac-simile of the book of Psalms, from the manuscript now under consideration of which twelve copies are on vellum, to match with the copies of the New Testament. To complete the Old Testament in a similar manner, the British Parliament, at the recommendation of several church dignitaries, and the two universities, engaged to defray the expenses of completing this noble undertaking. The Pentateuch, and the notes belonging, we understand, were published at the price of seven guineas. The work is executed in a splendid folio size, so as to render every iota of the original manuscript in the most faithful manner. The better to preserve the identity of the original, instead of spinning out the contracted various readings in the margin by letters in the full, after the manner of Dr. Woide, fac-similes of such various readings,

cut in wood, are inserted precisely in the places where they occur, filling up only the same space with the original. The tail pieces, or rude Aranesque ornaments, at the end of each book, are also represented by fac-similes in wood. The edition is limited to 250 copies. For further information concerning the Alexandrian manuscript, the reader is referred to Dr. Grabe's Prolegomena, in his edition of the Greek Septuagint, and the Prolegomena of Dr. Woide; also to those of Dr. Mill and Wetstein, prefixed to their editions of the New Testament; also Michaelis's Introduction to the New Testament, vol. ii. p. i. pp. 186—209. Bishop Marsh's notes in part ii. pp. 648—660. Dr. Lardner has given the table of contents of this manuscript, in his credibility of the Gospel History, part ii. chap. 147. (Works, 8vo. vol. v. pp. 253—256. 4to. vol. iv. pp. 44—46.)

ALEXANDRIAN LIBRARY, called by Livy, ‘Elegantiae regum curaeque egregium opus,’ was first founded by Ptolemy Soter, for the use of an academy, or society of learned men, in A. D. 304. Beside the books which he procured, his son Ptolemy Philadelphus added many more, and left in this library at his death a hundred thousand volumes; the succeeding princes of this race enlarged it still more, till at length the books lodged in it amounted to the number of seven hundred thousand volumes. In the collection of these books they are said to have seized all books that were brought by the Greeks, and other foreigners, into Egypt, and to have sent them to the Academy, or Museum, where they were transcribed by persons employed for that purpose. The transcripts were then delivered to the proprietors, and the originals laid up in the library. Ptolemy Euergetes, having borrowed of the Athenians the works of Sophocles, Euripides, and Eschylus, only returned them the copies, which he caused to be transcribed in as beautiful a manner as possible; retaining the originals for his own library, and presenting the Athenians with fifteen talents, or three thousand pounds sterling, for the exchange. As the Museum was at first in the quarter of the city called Bruchion, the library was placed there; but when the number of books amounted to four hundred thousand volumes, another library was erected within the Serapeum, by way of supplement, and therefore called the daughter library. The books lodged in this increased to the number of 300,000 volumes, and the two, making up 700,000, formed the royal libraries of the Ptolemies. In the war which Julius Caesar waged with Alexandria, the library of Bruchion was accidentally burnt. But the library in the Serapeum still remained, and there Cleopatra deposited the two hundred thousand volumes of the Pergamean library, with which she was presented by Marc Antony. These, and others added to them from time to time, rendered the library of Alexandria more numerous and considerable than at any former period, and though plundered more than once during the revolutions which

happened in the Roman empire, yet it was as frequently supplied, and continued for many ages to be of the highest utility, till it was burnt by the Saracens in the 642nd year of the Christian era. Abulpharagius, in his history of the tenth dynasty, gives the following account of this catastrophe. John Philoponus, surnamed the Grammarian, a famous Peripatetic philosopher, being at Alexandria when the city was taken by the Saracens, was admitted to familiar intercourse with Amrou, the Arabian general, and presumed to solicit a gift, inestimable in his opinion, but contemptible in that of the barbarians; and this was the royal library. Amrou was inclined to gratify his wish, but his rigid integrity scrupled to alienate the least object without the consent of the caliph. He accordingly wrote to Omar, whose well known answer was dictated by the ignorance of a fanatic. ‘If these writings of the Greeks agree with the Koran, or book of God, they are useless, and need not be preserved; if they disagree, they are pernicious, and ought to be destroyed.’ The sentence of destruction was executed with blind obedience; the volumes of paper or parchment were distributed to the four thousand baths of the city; and such was their number, that six months were barely sufficient for the consumption of this precious fuel. Since the dynasties of Abulpharagius have been given to the world in a Latin version, this tale, as Mr. Gibbon, Hist. vol. ix. p. 440., calls it, has been repeatedly transcribed; and every scholar has deplored this irreparable wreck of learning, arts, and antiquities. ‘For my own part,’ says this historian, adopting the scepticism of Renaudot, Hist. Alex. Patriarch, p. 170, ‘I am strongly tempted to deny both the fact and the consequences; the fact is indeed marvellous.’ ‘Read and wonder!’ says the historian himself; ‘and the solitary report of a stranger who wrote at the end of six hundred years in the confines of Media, is overbalanced by the silence of two annalists of a more early date, both Christians, both natives of Egypt, and the most ancient of whom, the patriarch Eutychius, has amply de-

scribed the conquest of Alexandria. But this curious anecdote will be vainly sought in the annals of Eutychius, and the Saracenic history of Elmacin. The silence of Abulfeda, Murtadi, and a crowd of Moslems, is less conclusive from their ignorance of Christian literature. The rigid sentence of Omar is repugnant to the sound and orthodox precept of the Mahomedan casuists: they expressly declare, ‘that the religious books of the Jews and Christians, which are acquired by the right of war, should never be committed to the flames; and that the works of profane science, historians or poets, physicians or philosophers, may be lawfully applied to the use of the faithful.’ Reland de Jure Militari Mohammedanorum, in the third volume of Dissertations, p. 37. The reason for not burning the religious books of the Jews or Christians, is derived from the respect that is due to the name of God. However, the positive evidence of an historian, of such unquestionable credit as Abulpharagius, cannot be set aside by an argument merely negative. Mr. G. acknowledges, ‘that a more destructive zeal may perhaps be attributed to the first successors of Mahomet.’ His reference to A. Gellius, *Noctes Atticae*, l. vi. c. 17, Ammian. Marcell., l. xxii. c. 16, and Orosius, l. vi. c. 15, as speaking of the Alexandrian libraries in the past tense, are foreign from the purpose; these writers only referring to the destruction of books at Alexandria in the time of Julius Caesar; after which, large libraries were continually accumulating, schools of philosophy flourishing, and new institutions arising from obscurity on almost every subject. *Brucker's Hist. Philos.* by *Enfield*, vol. ii. p. 228. *Ammian. Marcellin.* l. xxii. c. 16. p. 266. ed. *Gronov.* *Dion.* *Cass.* l. xlvi. 38. tom. i. p. 327. ed. *Reimari.* *Plutarch in Jul. Cæs. ALEXANDRIN, in geography, a small district of Italy, in the duchy of Milan, in the environs of Alexandria della Paglia, to which it owes its name.

ALEXANDRIN, or ALEXANDRIAN, in poetry, the name of a verse which consists of six feet or six feet and a half, equal to twelve or thirteen syllables; the rest, or pause, being always on the sixth syllable.

It is said to have taken its name from a poem on the life of Alexander, entitled, the Alexandriad; written, or at least translated into this kind of verse, by some French poets; though others will have it so denominated from one of the translators, Alexander Paris.

This verse is thought, by some, very proper in the epopœia, and the more sublime kinds of poetry: for which reason it is also called heroic verse. It answers in our language to the hexameters in the Greek and Latin; though, according to some, it rather answers to the senarii of the ancient tragic poets.—Chapman's translation of Homer consists wholly of Alexandrians.

The advantages of the Alexandrian verse, are

its keeping the rhymes from coming so near, and consequently hindering them from being so much perceived. To this may be added, that coming nearer to the nature of prose, it is fitter for theatrical dialogues, and supplies the office of the ancient iambics better than any other verse in rhyme. This measure is used either to close a verse, or distich, as by Spenser at the end of each stanza of his Faerie Queene; or else, but more rarely, wholly to compose the poem, as by Drayton, in his Poly Albion, and by Chapman, in his Homer. The pause is always on the sixth syllable. In the former instance it has the beautiful effect of a chord at the close of an air in music, and ends the verse with a full sweep; and in the latter it answers nearly to the hexameter of the classic verse, and is a sort of reitative in poetry. The etymology of its name is very uncertain; we have given the best conjectures. Pope's satirical illustration of its abuse is well known:

A needless Alexandrine ends the song,
Which, like a wounded snake, drags its slow length
along.

ALEXANDROVKA, a settlement of Asiatic Russia, on the banks of the river Kuma, being one of a long range of settlements which Catherine II. directed to be established with a view to the peopling that country, and thereby to strengthen her Caucasian frontier. It contains about 450 inhabitants.

ALEXANDROVSKAIA, a Russian fortress in the government of Ekaterinoslav, situated on the Dnieper forty miles below Ekaterinoslav, and 114 miles north-east of Cherson.

ALEXANDROW, the chief town of a circle in Russia, in the government of Vladimir, where the czar John Wassiljewitsch erected the first printing-press in Russia. It lies forty-eight miles east of Moscow.

ALEXICASON, or ALEXICACUS, from *ἀλεξω* to drive away, and *κακον*, or *κακος*, evil, an antidote against evil. Constantine Rhodocanaces gave this name to the spirit of sea-salt, and published a work on the subject under this title.

ALEXICACUS, in antiquity, an attribute of Neptune, whom the tunny fishers used to invoke, that their nets might be preserved from the *ξιφας*, or sword-fish, which used to tear them; and that he might prevent the assistance which, it was believed, the dolphins gave the tunnies on such occasions.

ALEXIPHARMICS, from *ἀλεξω*, *αρρεν*, to expel, and *φαρμακον*, poison, in medicine, are properly remedies for expelling or preventing the ill effects of poison. Some of the moderns having imagined that the animal spirits, in acute distempers, were affected by a malignant poison, the term has been understood to mean medicines adapted to expel this poison, by the cutaneous pores, in the form of sweat. In this sense alexipharmics are the same as sudorifics. It has also been occasionally used for amulets, and various real or supposed remedies against disease. Alexiphamic medicines are in general aromatic and pungent, although some acid plants and juices, from their use in malignant and colliqueative fevers, have been classed under this title. The principal alexipharmics in the animal king-

dom, are hartshorn, bezoars, and the bones and teeth of different animals. In the vegetable kingdom, the leaves and flowers of all the aromatic plants, especially such as are umbelliferous. In the mineral kingdom, the different preparations of antimony, the dulcified spirit of vitriol, together with alcohol in all its forms and combinations. They chiefly act by exciting or increasing a diaphoresis, or perspiration; or by supporting the vigorous motion of the heart and arteries, which is always diminished in malignant diseases unattended by inflammation. In this latter sense wine may be reckoned among the principal alexipharmacis. These medicines are also esteemed preservatives against malignant and pestilential fevers; but they are to be used with caution.

ALEXIS, (Michaelovitch,) of Russia, born in 1630, and succeeded his father Michael as czar, in 1646, was the father of Peter the Great, an able monarch, and the first Russian ruler who acted on the policy of a more intimate connexion with the other states and nations of Europe. He preceded his celebrated son in measures for the civilization and political and commercial improvement of Russia, and by his diversion of the Turkish arms, greatly contributed to the celebrated victory over that nation, obtained by John Sobieski, king of Poland, near Choszyn. He died at the age of forty-six in the year 1677, was succeeded by Peter the Great, his son by his wife Natalia.

ALEXIS, a native of Piedmont, and author of a book of secrets, which was printed at Basle 1536, in 8vo, and translated from Italian into Latin by Wecher. It has also been translated into French, and printed several times with additions. There is a preface to the piece, wherein Alexis informs us, that he was born of a noble family; that he had from his early years applied himself to study; that he had learned the Greek, the Latin, the Hebrew, the Chaldean, the Arabian, and several other languages: and having an extreme curiosity to be acquainted with the secrets of nature, he had collected as much as he could during his travels for fifty-seven years. That he had piqued himself upon not communicating them to any person; but that when he was eighty-two years of age, having seen a poor man who had died of a sickness, which might have been cured, had he communicated the recipe to the surgeon who took care of him, he was touched with such a remorse of conscience, that he lived almost like a hermit; and it was in this solitude that he arranged his secrets in order to be published.

ALEXIS, grand duke of Russia, the unfortunate son of Peter the Great, called also PETROVICH, which see.

ALEYN, (Charles,) an English poet in the reign of Charles I. In 1631, he published two poems on the famous victories of Cressy and Poictiers. He succeeded his father as clerk of the ordnance, and was commissary general of the artillery to the king at the battle of Edge-hill. He also wrote a poem on that victory which placed Henry VII. on the throne of England. In 1639, the year before he died, he translated the history of Eurialius and Lucretia, from the Latin epistles of *Eneas Sylvius*.

ALFADER, the Danish name for the universal father and creator of all things. See *Southey's Book of the Church*, vol i. p. 67.

ALFAQUES, among the Moors, the names generally used for their clergy, or those who teach the Mahommedan religion; in opposition to the Moabites, who answer to monks among Christians.

ALFARO Y GAMON, (Don Juan De,) a Spanish painter, was born at Cordova, in 1640, he studied successively under Castillo and Velasquez, to whose style he adhered, but in his portraits he adopted the manner of Vandyck. Two of his finest pieces, are a picture of the Nativity, and the Guardian Angel. He attached himself to the admiral of Castile, and lived in his family on terms of friendship, till the time of that grande's exile in 1678, when he left Madrid, and retired to his native city. Here he lived in obscurity, until an edict was published, levying a tax upon paintings, when Alfaro laid aside the pencil. He suffered great distress, until information reached him in 1680, that his patron was released, when he hastened to Madrid, and repairing to the house of the admiral, was refused admission, when he retired, and in a few days died of a broken heart. 'Thus perished,' says Pilkington, 'one of the most ingenious and elegant artists that Spain ever produced; and a man described to have been of refined manners, and of a most tender and susceptible spirit.'

ALFATERNA, in ancient geography, the last town of Campania, beyond Vesuvius: the same with Nocera, which see.

ALFECCA, in astronomy, the star otherwise called Alpheccar and Lucida corona.

ALFENUS, (Varus,) a Roman lawyer, native of Cremona, and a disciple of Servius Sulpitius, who flourished about the year one of the Christian era. He is mentioned by Horace as having formerly been a shoemaker, and as having quitted that trade for the profession in which he obtained his reputation. Hor. Sat. iii. v. 130.—He wrote several works, of which Paulus the civilian made an abridgment, and he is referred to as an authority in matters of law by Ammianus Marcellinus; and Aulus Gellius mentions him as a diligent enquirer into antiquities. Some say that he was consul, and was buried at the public expense.

ALFET, in our ancient Anglo-Saxon laws, from *elam* to burn, and *fat*, a vessel, Sax. a caldron full of boiling water, wherein an accused person, by way of trial or purgation, plunged his arm up to the elbow, and held it there some time. If he was hurt he was held guilty; if not, he was acquitted.

ALFIIDENA, an ancient town of Italy, in the kingdom of Naples, and in the citerior Abruzzo, fifteen miles south-south-west of Salmona. It was famous in the wars of the Samnites, with the Romans. It gives title to a marquis. Lon. 14°. 10' E. Lat. 41°. 48' N.

ALFIERI, (Victorio,) the Italian Sophocles, was born in Aste, a city of Piedmont, about half way between Turin and Alepondria, on the 17th of January 1749, of a noble family. He has favoured the world with an account of himself and his writings, carried nearly down to

the period of his death; from which we shall select a sketch of the principal incidents and employments by which his remarkable life was distinguished. When an author becomes his own biographer, he can boast at least of possessing the most intimate knowledge of his subject, whatever be his other qualifications for the task he undertakes, and whatever other claims he may have upon the faith of his readers. In the present instance, we have the testimony of his contemporaries, in support of the veracity and candour with which this extraordinary man details his own history, in addition to the internal evidence of its own fearless frankness and bold disclosures. Alfieri divides his own history into almost as many eras as Shakspeare's seven ages; but in the two first of these, which he styles his infancy and adolescence, there is nothing particularly worthy of notice, except taken in connection with the talents he afterwards displayed, and the celebrity he acquired. His father, Anthony Alfieri, was a nobleman, who was distinguished for no knowledge or information. He married the mother of our poet, when above fifty years of age; and the first fruit of this marriage was a daughter, the second the subject of this memoir. The father of Alfieri survived this latter event only a year, when his widow married again. Alfieri when very young was committed to the care of a priest, called father Ivaldi, for the purpose of being taught Latin, from whom he learned but little. On one occasion he had to submit to the dreadful suffering of walking to the church with a silk night-cap, for having told a lie; and he philosophically ascribes his candour and regard to truth, in subsequent life, to this disgraceful punishment. If this be correct, we owe the confidence with which we may read his history to a very trifling cause; and whenever we cannot lend implicit credit to his testimony, we must suppose that he has forgotten the night-cap. At the age of nearly ten years, he was taken from under the tuition of his domestic pedagogue, and sent to Turin, to be under the care of his uncle, and to receive his education at the academy. Here he speaks of learning as little as under father Ivaldi. At his thirteenth year, he was fitted for the university; and there he entered upon philosophy and geometry. In the peripatetic philosophy, he made such progress, that he was able to answer almost all the questions asked him by his teachers; and he committed the whole six books of Euclid to memory, without being able to comprehend the fourth proposition. He had even at this age a contempt for the useless and pedantic jargon of logic, which he was forced to acquire. Though he had at this time read none of the Italian poets but a part of Ariosto and Metastasio, he composed his first sonnet, which not being approved of by his uncle, deterred him for twelve years from the services of the muses. His paternal uncle, who was governor of Sardinia, died about this time; and he was led to meditate upon plans for spending with eclat that more liberal portion of his fortune which it was now permitted him to enjoy. He had enrolled himself as an officer of the militia; but

he now only thought of those methods of employing his time, which would acquire him the greatest distinction, or bring him the greatest pleasure.

Travelling was one of those pursuits which obviously offered the greatest allurements to his restless disposition; and he accordingly determined to seize the earliest opportunity of commencing his rambles. He had frequently heard the students from England, Germany, Poland, and Prussia, describe the wonders of their various countries; and he was inspired, either with the curiosity of seeing them, or with the ambition of being as far travelled as his companions.—But his first excursion from home was confined to Italy. An opportunity occurred of being able to traverse Italy to Rome and Naples, under the care of an English catholic, who had the charge of two Dutch pupils—his school-fellows in the academy; and he prevailed upon his brother-in-law to solicit permission from the king for that purpose. His Sardinian majesty, it would appear, allowed none of his nobility to leave his dominions without obtaining his consent. This permission being obtained, on the 4th of October 1766, our young poet left Turin for Naples, but as he had made no preparations for travelling with advantage, he avows he neither understood nor relished any works of the fine arts: and in a country where nothing else is read but poetry, he had not perused any of the poets but Ariosto and Metastasio: he could not even speak Italian with propriety, and although he spoke French with facility, he had not studied its structure, nor attempted to attain its elegance. When at Florence he began to learn English—a language in which he never made any proficiency, and which, together with the French, he afterwards despised and disliked. Although his ignorance rendered his travels of little importance to his mental improvement, yet the circumstance of his keeping a journal of his observations, and the anxiety he felt from classical recollections before he entered Rome, are indications of reflections and feelings which could not belong to every idle youth of eighteen. At Naples he got quit of his tutor, the English catholic, and of his two Dutch companions, and commenced his rambling alone. He visited Venice; and, without returning to Piedmont, passed by Genoa and Marseilles to Paris, where he arrived in August 1757. We find him soon afterwards in London; and during the four months he remained there, he had it in his power, by means of the Spanish ambassador (who was originally a Piedmontese) and his own fortune, to satisfy his thirst for dissipation, and his propensity to jockeyism. ‘My amusement,’ says he, ‘during the winter, consisted in being on horseback five or six hours every morning, and being seated in the coach-box for two or three hours every evening, whatever might be the state of the weather.’ He felt the attractions of England at one time so powerful, that he resolved to fix his residence in it; but his resolution was abandoned almost as soon as formed. At the Hague he made a friend of the Portuguese ambassador, and became enamoured of a Dutch lady. The violence of his passion could scarcely

obtain credit, did we not take into account the previous instances of his ardent temperament. When the lady was obliged to leave the Hague to join her husband in Switzerland, he committed a thousand follies, called on death to his aid, and, among other extravagancies, after causing himself to be bled by a surgeon, he tore the bandage from his arm; and, if his servant had not interposed, would have destroyed himself. He was at this time importuned by his friends to marry, but he felt a 'reluctance to have his children born at Turin,' and did not pursue his suit with the ardour necessary to ensure success: he again, after settling his affairs, resolved to travel. Without following him in his rambling career, it will be sufficient to state, that in this second erratic sally he visited successively, Germany, Hungary, Denmark, and Sweden; Russia, Prussia, Holland, and England; Spain and Portugal. In Turin he again took up his residence; and having fitted up a splendid house, he began to entertain his friends, and to live in a style of elegance and luxury. These friends, who consisted principally of young men who had been his college-fellows, constituted themselves into a society, with something of the formalities of free-masonry, and agreed to meet at one another's houses several times in the week, for the purpose of conversation upon any subject that might occur, or for reading small essays at composition, to which the members should anonymously contribute. Alfieri was here the greatest contributor to the society's amusement, and gave in several papers, which were read with eclat. He had by this time, although his life was principally spent in dissipation, acquired a considerable acquaintance with French literature; he had studied latterly some of the best Italian authors; had seen much of mankind; and he possessed a power of fancy and invention that could render his acquirements useful or entertaining. He even began at this time, from the praises he received, to imbibe a greater confidence in his own faculties, and to rise to the hope of being able to execute some work for immortality. The abbe Caluso, whom he met with at Lisbon in the suite of the Piedmontese ambassador, and who continued the friend of his subsequent life, almost convinced him that he was a poet, and now was drawing near the time when he was destined to prove his title to that character. A sonnet was the first poetical offspring of his genius. Having once accidentally composed a dialogue on the subject of Cleopatra, and hearing the work of an obscure author on the same subject praised by one of his friends, which he thought inferior to his own, the state of his mind, and the circumstances in which he was placed, recommended it to him as a theme for his first dramatic effort: and, accordingly, after much consultation with those in whose opinions he confided, he produced, in the twenty-seventh year of his age, the tragedy of Cleopatra, which was represented at Turin on the 16th of June 1775. Having now become a candidate for literary and dramatic fame, he prosecuted the means of success with his characteristic ardour; and the laborious assiduity of the latter part of his life forms a perfect contrast to

the idleness and dissipation of the former. The subsequent history of his life is little more than an account of his labours and publications. He transferred his property to his sister for an equivalent, that he might have no more to do with Piedmont. He studied the Latin classics with the greatest ardour; he composed upwards of twenty tragedies, besides satires, odes, sonnets, and prose works on government and literature; he studied afterwards Greek, when upwards of fifty, and wrote comedies; he finished various translations of prose and poetical authors; he devoted a portion of his time to the reading of Hebrew; and, after more than twenty years of toil and glory, which our limits will not permit us to dwell upon, he died one of the most accomplished characters of his age, on the 8th of October, 1803. He was interred in the Franciscan church of St. Croce in Florence, a sanctuary where repose the ashes of Galileo, Michael Angelo, Arretino, and many other illustrious men; and over him there is placed a monument, representing Italia mourning for his loss, a work of the great Conova. The majestic figure of Italy is invested with flowing robes, and adorned with a turreted crown; which circumstances gave rise to an epigram, repeated to the author of this article by one of the monks, purporting, that this clothed figure was by no means a true representation, and that the statuary had forgotten that she was stript by Buonaparte. The style of his tragedies is peculiarly his own. He keeps one subject in view, and pursues it from the beginning to the end of the piece without digression, without trifling or delay. The persons he introduces are few, and all are necessary to the development of the plot. He allows no under plot, nor gossiping among servants. The language is always vigorous and energetic, but destitute of imagery or ornament; seldom very smooth, but always elegant and varied. The understanding of Alfieri was as comprehensive and penetrating as his imagination was inventive, and enabled him particularly to shine in disquisitions concerning government, history, and criticism.—Though, during the latter period of his life, he devoted his time chiefly to reclusive study, he was not an inattentive spectator of the events that were passing around him. He had early imbibed a love of liberty, and he added to it afterwards a love of Italy. These two passions constituted a fever which continually boiled in his veins, and imparted much heat to his conversation, his poetry, and political sentiments.—Never had freedom a more ardent worshipper at her shrine, nor had ever Italy a more fond admirer; but these feelings were rather guided by his imagination than his reason, and acted more in sharpening his hatred of those whom he considered as oppressors, than in suggesting remedies against oppression. The French domination he cordially detested; and, preparing in return to expect persecution, he made his will, and settled his affairs before they entered Florence. His passions, as will be seen, during the whole of his life, were violent; and, in the early part of it, made his history almost the history of a hurricane. He sometimes surrendered his mind to the dominion of caprice, without capitulation or

condition, and obeyed her dictates without attempting resistance; but where his affections were engaged by a worthy object, he was steady and unchangeable. He had a strong propensity to satire and sarcasm; but he never indulged it at the expense of those whose attachment he enjoyed and valued. Of his mother he always spoke with affectionate regard; and his friends had reason to delight in his unreserved communication when living, and to cherish his memory when dead. His works consist of twenty tragedies, six comedies, sonnets, odes on liberty, &c.

ALFORD, a town in Lincolnshire, with a market on Tuesdays for provisions and corn; and two fairs, on Whit-Tuesday, and November 8th, for cattle and sheep. It is seated on a small brook that runs through the town, and is a compact well built place. A salt spring was discovered here in 1670, from the pigeons which flew thither in great numbers to drink the water; these birds being known to be fond of salt. It contains a purging salt, together with a portion of sea-salt, and is recommended as cooling, cleansing, and attenuating. Alford is 6 miles from the sea, 20 north of Boston, and 140 north of London. Long. 0°. 15'. E. Lat. 53°. 30'. N.

ALFORD, a district of Aberdeenshire, eleven miles long from east to west, and between four and six miles long from north to south, reckoning from the tops of the mountains. It comprehends five parishes, viz. Forbes, Keig, Tillynessle, Tough, and Alford; and the eastermost part of it is situated twenty miles west from Aberdeen. The Don is the principal river in this district.

ALFRAGAN, AHMED EBN KOTHEIR AL FARGANI, or, as others call him, MOHAMMED EBN KETIR AL FORGANI, in biography, a celebrated Arabian astronomer, born at Fergan, in Sogdiana, now Samarcand, and flourished in the beginning of the ninth century, under the Caliphate of Al-Mamoun. His principal work, in Arabic, entitled, *Rudimenta Astronomica*, consists of thirty chapters or sections, and is formed upon the principles of Ptolemy, whom the author often cites. Of this work we have a Latin translation by Johannes Hispaniensis.

ALFRED, commonly called **THE GREAT**, an Anglo Saxon monarch, one of the most illustrious on record in the history of nations. He was the youngest son of Ethelwolf, king of the West Saxons, and born at Wantage, Berks. A.D. 849. At the age of five years he was sent by his father to Rome, when he was confirmed, and, as some writers assert, royally anointed by pope Leo IV. Soon after his return, he accompanied his father again to the same capital. It was by this early travelling that his dawning faculties received that favourable direction by which they were, in future life, so admirably distinguished. Alfred was in his tenth year when Ethelwolf died, and was succeeded successively by his elder sons Ethelbald, Ethelbert, and Ethelred, by the last of whom Alfred was employed as chief minister and general. In 871, when a Danish force, which had successfully invaded England in 866, under the command of Hubba and Hinguar, marched to Reading, and mastered both town and castle, Ethelred and Alfred collected a force, and obtained a victory

over the invaders, but were soon however routed, near Devizes; when Ethelred, receiving a wound which terminated his existence, left the crown of England to Alfred, then in his twenty-second year. The first conflict of this prince with the Danes, at Wilton, was unsuccessful; but they were subsequently compelled to agree to a peace. This they violated; but, in consequence of a great naval victory obtained by Alfred, were reduced, a second time, to the same terms. The arrival of new hordes, however, so increased their number in Wiltshire, that the Saxons could not withstand them; and Alfred himself, laying aside all marks of royalty, took shelter in the house of one of his neatherds. While in this obscure retreat, a little adventure occurred, of which most of our English historians take notice. The woman of the house having placed some cakes before the fire to toast, ordered Alfred to attend them. Intent on trimming his bow, the king suffered the cakes to burn without observation, which so enraged the good woman, that she rated him soundly, and doubted not that he would be ready enough to eat them, though so little inclined to attend to them. Soon after, collecting a few faithful followers, he took possession of the small isle of Athelney, formed by the confluence of the Tone and the Parrot, in Somersetshire, whence he sallied out occasionally upon the unguarded quarters of the Danes in his neighbourhood. At length, understanding that Odun, earl of Devonshire, had obtained a signal victory over the Danish leader Hubba, and taken the famous magical standard of the raven, he left his retreat, and proceeding towards the camp of Guthrum, the Danish prince, in the disguise of a harper, remained several days making observations. He then summoned his nobles, with their followers, to a general rendezvous on the borders of Selwood Forest, and defeating the enemy in battle, surrounded their camp, and compelled them to surrender. It was the policy of Alfred, if possible, to transform them into subjects, and for that purpose he gave them settlements in East Anglia and Northumberland, on condition of allegiance and conversion to Christianity. It is said the king himself stood sponsor for Guthrum at the font. On this happy re-establishment, Alfred exerted himself for the defence of his kingdom. He erected castles and fortresses, formed a militia, and got together an armed fleet of 100 sail, which he manned partly with his subjects, and partly with Frisians. He also besieged and recovered the city of London, which he found in a miserable condition, but he repaired and maintained it as a fortress. In 893, an interval of some years having elapsed, a Danish fleet, after ravaging the coast of France, disembarked a large force in Kent, which was, however, checked by the vigilance of Alfred. He had then turned his attention to the rebellious operations of his new subjects in East Anglia and Northumberland, who appeared suddenly with a fleet off the western coast; and having put down all these annoyances, he closed the whole warfare by the capture of some Northumbrian Danes, who were ravaging the west, and whom, after a legal trial, he executed as pirates. The remainder of the life of Alfred was

peaceable; for such was now his character, that the Danish settlers, on the east and the north, humbly submitted. The Welsh also acknowledged his authority; and after fifty-six battles, in which he had been personally engaged by sea and land, he found himself undisputed king of the island as far as the frontiers of Scotland. Great and active, however, as Alfred appears in warlike exploits; as a legislator, a reformer of manners, and a promoter of learning and the arts, his exertions were still more extraordinary. He laid the foundation of the common law of England. The institution of the trial by jury, attributed to him, Sir William Blackstone conjectures he only adopted and improved: the same observation is extended by Whitaker and others to the division of the country into shires, hundreds, and tithings, for purposes of judicature and police. It is certain, however, that the general survey of the kingdom, called the Winchester Book, the origin of that of Doomsday, was compiled by the order of Alfred. Judicial administration seems to have engaged no small share of the attention of this monarch; for, in addition to his regulations in favour of general and equal justice, he severely punished delinquency in any of its departments. The political constitution of England is also presumed to be indebted to Alfred for the settlement of one of its principal regulations, viz. a regular convocation of the states. His great council, consisting of bishops, earls, aldermen, and thanes, was by an express law called together twice a year in London, for the better government of the realm. In other circumstances he also showed a paternal regard for the welfare of his people, dedicating a large portion of his revenues to the rebuilding of cities ruined by the Danes, the erecting of new ones, and the restoring of monasteries and other religious foundations. His encouragement of learning was as distinguished as his own proficiency therein; of the ecclesiastics, Alfred complained that there were very few south of the Humber who either understood the service of the church, or could translate a single piece of Latin into English. To remedy this defect, he invited men of learning to his court, from all parts, and placed them at the head of seminaries in various parts of his kingdom. He has been called the founder of the University of Oxford, or at all events is said to have founded University College, Oxon; but there is reason to believe, from the recent researches of Whitaker and Smith, that these assertions are not absolutely correct; it is however admitted that he greatly improved the system of education there. Alfred himself may be said to stand at the head of the list of royal authors; so many works indeed are attributed to him, that, in order to keep within the bounds of credibility, it must be presumed that he only patronized many of the voluminous translations which bear his name. Versions of Orosius, of Bede, of Boethius, of several pieces of St. Gregory, of Aesop's Fables, of various religious works, including the Psalter, together with several collections of legal and historical matters are attributed to his pen. In the translation of Orosius is also an account of a voyage, made under his patronage, for the discovery of a north-east passage; and he even

fitted out an expedition to carry alms to the Christians of St. Thomas in the East Indies and received back the commodities of the country. To accomplish all these things, as the nicest distribution of his time and his revenue was essential, he entered into the strictest arrangement for the employment of both. To crown his great public character, Alfred is described as one of the most mild and amiable of men in private life; of a serene temper, cheerful, affable, kind, and merciful; eminently pure in his own conduct and manners, yet not averse to society, or to innocent recreation. He was personally well-favoured, possessing a handsome and vigorous form, dignified by a commanding and engaging aspect. After reigning twenty-eight years and a half, this prince died, according to some accounts, A. D. 900, although others say 901. By his queen Elswitha he had three sons and three daughters; one of his sons died in his father's life time; the second, Edward the Elder, succeeded him. One of his daughters, named Aelfleda, married to an earl of Mercia, is said to have inherited the greatest portion of his talents. In this age of critical research, some doubts have been thrown on the accuracy of the unmixed panegyric of the monkish authors, from whose writings this history of Alfred is chiefly drawn. His benefactions to the church and to religious and learned men may be supposed to have influenced them—borne away by the strength of a character, it was scarcely in their nature to conceive or to invent; for the qualities and actions ascribed to him are of a higher class than those which usually form the themes of monkish adulation. But since there is no contradiction of their general testimony from other quarters, it is not well to cavil away the attributes of an exalted character, whose name is associated with the origin of some of the most important institutions in the country, in favour of hypercriticism on the one hand, or party predilection on the other. At present, the history of Alfred presents an almost perfect union of monarch, patriot, and man—one of those fine examples of the admixture of the true elements of greatness and of goodness, which are so seldom witnessed among mankind, but which occasionally exist as blessings in their own age, and as models for all posterity.

'The merit of this prince both in private and public life,' says Hume, 'may be set in opposition to that of any monarch or citizen which the annals of any age or any nation can present to us. He seems indeed to be the model of that perfect character, which, under the denomination of sage or wise man, philosophers have been fond of delineating rather as a fiction of their imagination, than in hopes of ever seeing it really existing. So happily were all his virtues tempered together; so justly were they blended, and so powerfully did each prevent the other from exceeding its proper boundaries! He knew how to reconcile the most enterprising spirit with the coolest moderation; the most obstinate perseverance with the easiest flexibility; the most sincere justice with the greatest lenity; the greatest vigour in commanding, with the highest and most perfect affability of deportment; the highest

capacity and inclination for science, with the most shining talents for action. His civil and military virtues are almost equally the objects of our admiration, excepting only that the former being more rare amongst princes, as well as more useful, seem chiefly to challenge our applause. Nature also, as if desirous that so bright a production of her skill, should be set in the fairest light, had bestowed on him every bodily accomplishment, vigour of limbs, dignity of shape and air, with a pleasing, engaging and open countenance. Fortune alone, by throwing him into that barbarous age, deprived him of historians worthy to transmit his fame to posterity; and we wish to see him delineated in more lively colours, and with more particular strokes, that we may at least perceive some of those small sparks and blemishes, from which, as a man, it is impossible he could be entirely exempted.' *Hume's Hist.* vol. 1, p. 100, 101.

ALFRETON, from Alfreton, Sax. i.e. Alfred's town, a town in Derbyshire, built by Alfred the Great, pleasantly situated on a small hill, six miles from Chesterfield, thirteen north of Derby, and 142 north-west of London. The manufactures are stockings and brown earthenware. It has a weekly market on Monday, and an annual fair 20th July, for horses and horned cattle.

ALGAE, FLAGS, one of the seven families, or natural tribes, into which the whole vegetable kingdom is divided by Linnaeus, in his *Philosophia Botanica*. They are defined to be plants, whose root, leaf, and stem are all one. Under this description are comprehended all the sea weeds, and some other aquatic plants. In the sexual system, they constitute the third order of the twenty-fourth class Cryptogamia; in Tournefort, the second genus of the second section, Marinae, aut fluviatiles, of the twenty-seventh class, Asperniae vulgo habite; and the fifty-seventh order in Linnaeus's *Fragments of a Natural Method*. The algae are distributed by Lamarch into three divisions: the first of which comprehends all those plants, whose fructification seems doubtful. These commonly live in water, or upon moist bodies, and are membranous, gelatinous, or filamentous. To this division are referred the byssi, conferva, ulva, tremella and varec. The plants of the second division are distinguished by their apparent fructification, although it be little known, and are formed of parts which have no particular and sensible opening or explosion at any determined period; their substance is ordinarily crustaceous or coriaceous. They include the tassella, ceratosperma and lichen. The third division comprises plants, whose fructification is very apparent, and which are distinguished by constituent parts which open, at a certain period of maturity, for the escape of the fecundating dust or seeds. These plants are more herbaceous, both as to their substance and colour, than those of the other two divisions, and are more nearly related to mosses from which they do not essentially differ. Their flowers are often contained in articulated and very elastic filaments. This division includes the riccia, blasia, anthoceros,

targiona, hepatica, and jungermannia. In the Linnaean system the algæ are divided into two classes the terrestres and aquatice. The former include the anthoceros, blasia, riccia, lichen, and byssus, and the latter are the ulva, fucus and conferva. The fructification of the algæ, and particularly of those called aquatice, has been denominated the opprobrium botanicorum.

ALGAGLIOLA, a small sea-port town in the island of Corsica, fortified with walls and bastions. It was almost destroyed by the malcontents in 1731, but has since been repaired. Lon. 9°. 45'. E. lat. 42°. 10. N.

ALGARDI, ALESSANDRO, in biography, an eminent artist, as a sculptor and architect, born at Bologna in 1598. He became a disciple of Julius Caesar Conventi, and acquired a reputation in sculpture little inferior to that of Michael Angelo Buonaroti. He also frequented the school of the Caracci, from whom he probably learned the art of engraving, as his style resembles that of Augustino Caracci, being slight and free, and his execution with the graver is bold and open. In 1625, when at Rome, he became acquainted with Domenichino, who obtained for him the statuary work of the chapel Bandini, which he was painting. For some years before he had been chiefly employed in repairing antiques and modelling for goldsmiths; but his talents and reputation now procured him superior work. The first display of his powers was a statue of St Philip de Neri, in the sacristy of the oratory at Rome. His group of the decollation of St. Paul for the Barnabite church at Bologna, and the tomb of Leo XI. at St. Peter's were among the first efforts of his genius. One of his principal performances was a bas-relief in this cathedral, thirty-two feet by eighteen, representing the story of Attila, the labour of four years, and which, when finished, gained him universal applause, also the honour of knighthood and the golden cross. His bronze figure of Innocent XI. is reckoned the finest of all the statues of the popes in Rome. A crucifix likewise, called by way of distinction, Algardi's crucifix, has been much admired, and often copied. He was assiduous and quick in execution, but, becoming infirm, he was compelled to avail himself of the assistance of his pupils, of whom he formed an eminent school. He died in 1654, at the age of fifty-two years. He lived in celibacy, and left his property to his sister. His works are held in high estimation, though the air of his heads are esteemed too studied.

ALGAROTH, powder of, is a white oxyd of antimony, which may be obtained by precipitating the oxymuriate of antimony in pure water. The precipitate when dried is called algaroth. Although the ease with which it may be obtained might render it advantageous as an antimonial medicine, the London practice has entirely rejected it, but it is used at Edinburgh and on the continent as the basis of emetic tartar or tartarized antimony.

ALGAROTTI, (Count,) a celebrated Italian writer, a native of Padua. Led by curiosity and a desire of improvement, he travelled early into foreign countries; and was very young when he arrived in France in 1736. Here he composed

his Newtonianisme pour des Dames. He was noticed by Frederic, king of Prussia, who conferred on him the honour of knighthood, a consulship, and the post of chamberlain. He died at Pisa in 1764; and ordered his own mausoleum with this inscription to be fixed upon it: 'Hic jacet Algarettus, sed non omnis.' i.e. 'Here lies Algarotti; but not the whole of him.' He was a great connoisseur in painting, sculpture, and architecture, and contributed much to the reformation of the Italian opera. His works are numerous, and upon a variety of subjects, abounding with vivacity, elegance, and wit:—According to the last and most correct edition of Venice, 1790 and 1794, they form seventeen volumes 8vo., and consist of Memoirs of his Life and Writings; An Analysis of the Newtonian System; Pieces on Architecture, &c.; Travels in Russia; Letters on Painting, &c. &c.

ALGARVA, once an independent kingdom, and now a southern province in the kingdom of Portugal, sixty-seven miles in length and twenty in breadth; bounded on the south and west by the sea, on the east by the Guadiana, and on the north by Alentejo. It is very fertile in figs, almonds, dates, olives, and excellent wines; the fishery also is extensive. The capital town is Pharo. It contains four cities, twelve

towns, sixty-seven parishes, and about 96,000 inhabitants.

ALGATES', { Sax. algeatę, all-ways. Gate ALGETE'. } is the same as via, a way. Todd's Johnson. Tooke supposes it to mean all-gett, and says, get is sometimes spelt by Chaucer geate. Geate, pronounced as here written, is used for gate in the rustic dialect of the western counties. Does this favour Johnson's etymology? By all means, notwithstanding.

Alfrede was eldest, non mot his wille withhold
To London he wild allegate to speke with kyng
Harald. *R. Brunne*, p. 52.

He wolde, *algate*, his trouth holde,
As every knight thereto is holde,
What hap souer him is befall.

Gower. Con. A. book i.
Bifore alle thingis haue ye charite ech to othire,
in yousilf *algatis* lastinge for clarite keurith the
multitude of synnes. *Wicklif.* *1 Peter*, c. iv.

Nor had the boaster ever risen more,
But that Renaldo's horse ev'n then down fell;
And, with the fall, his leg oppress'd so sore;
That, for a space, there must he *algates* dwell.

Fairfax.

ALGAVAREIA, the language anciently spoken by the Moors, or Moriscos in Spain.—It was a dialect of Arabic, and stood contradistinguished from the ALGAMEIA.

A L G E B R A.

ETYMOLOGY, DEFINITION AND HISTORY OF ALGEBRA.

We cannot introduce this science better, than by the derivations and definition of the word, and the account of the origin of the art, given by Dr. Johnson.

ALGEBRA, *n.s.* an Arabic word of uncertain etymology; derived, by some, from *Geber* the philosopher; by some, from *gefır*, parchment; by others, from *algeħista*, a bone-setter; by Meñage, from *algiabarat*, the restitution of things broken. This is a peculiar kind of arithmetic, which considers the quantity sought, as if it were known, and by means of its relation to one or more quantities given, proceeds by consequence, till the quantity at first only supposed to be known, is found to be equal to some quantity or quantities which are known, and consequently itself is known. This art was in use among the Arabs, long before it came into this part of the world; and they are supposed to have borrowed it from the Persians, and the Persians from the Indians. The first Greek author of algebra, was Diophantus, who, about the year 800, wrote thirteen books. In 1494, Lucas Pacioli, or Lucas de Burgos, a cordelier, printed a treatise on algebra, in Italian, at Venice. He says, that algebra came originally from the Arabs. After several improvements, by Vieta, Oughtred, Harriot, and Descartes, Sir Isaac Newton brought this art to the height at which it still continues. *Trevoux, Chambers.*

To be more particular, algebra is defined, by authors who have written expressly upon the

subject, to be a general method of computation by means of signs and symbols, commonly the letters of the alphabet, by which numbers or any other quantities are represented, and hence it is called universal arithmetic, literal arithmetic, and the arithmetic of signs.

Besides the derivations above quoted, several other fanciful etymologies have been given of the word algebra. By the Arabians it is coupled with the word macabelah, signifying opposition and comparison. Thus, algebra almacelabah is used by them to express what we properly call algebra; and which is explained to be the act of restitution and comparison, or opposition and comparison, or resolution and equation. Some, with great probability, derive it from *geber*, by prefixing the article *al*, which properly signifies the reduction of fractions to a whole number.

ALGEBRA seems not to have been wholly unknown to the ancient mathematicians. We see the traces and the effects of it, in many places, though it looks as if they had designedly concealed it. Something of it there seems to be in Euclid, or at least in Theon upon Euclid, who observes that Plato had begun to teach it. There are instances of it in Pappus, and more in Archimedes and Apollonius. But the analysis used by those authors is rather geometrical than algebraical; as appears by the examples we find in their works: so that we may safely say, that Diophantus is the first and only author among the Greeks, who has treated of algebra professedly. It was known, however, among the Arabs, much earlier than

Among the Greeks; and the Arabs carried it into Spain; whence, some are of opinion, that it passed into England, before Diophantus was known among us. Only six of Diophantus's books are extant. They were translated into Latin, by Xylander, in 1575; and published in 1621, in Greek and Latin by M. Bachet and Fermat. This algebra of Diophantus only extends to the solution of arithmetical indeterminate problems. The first European writer on algebra is Lucas Paccioli, or Lucas de Burgos, a Minorite friar, who, having previously given small treatises, published at Venice, in the year 1494, his principal work in Italian on algebra. He makes mention of Leonardus Pisanus, and some others, of whom he had learned the art; and adds, that algebra came originally from the Arabs; but, as he never mentions Diophantus, it is probable, that that author was not then known in Europe. His algebra goes no farther than simple and quadratic equations, and positive roots only are used. After him came Stifelius, Scipio Ferreus, Cardan, Tartaglia, and some others, who reached as far as the solution of some cubic equations. Bombelli followed these, and went a little farther. Nunnius, Ramus, Schoner, Salignac, Clavius, &c. took different courses, but none of them went farther than quadratics. In 1590, Vieta introduced his Specious Arithmetic, denoting the quantities, both known and unknown, by symbols or letters. He also gave an ingenious method of extracting the roots of equations, by approximations; since greatly improved and facilitated by Raphson, Halley, Maclaurin, Simpson, and others. Oughtred, an Englishman, in his Clavis Mathematica, printed in 1631, improved Vieta's method, and invented several compendious characters, to show the sums, differences, rectangles, squares, cubes, &c. Harriot, another Englishman, cotemporary with Oughtred, left at his death, a work on Algebra, which was printed in 1631. In it Vieta's method is put into a form, which is still in estimation. In 1657, Des Cartes published his geometry, in which he applied Harriot's method to the higher geometry, explaining the nature of curves by equations, and adding the constructions of cubic, biquadratic, and other higher equations. From the time of Des Cartes, continual improvements have been made in the science, by Baker, Fermat, Schooten, Slucius, Wallis, Newton, Mercator, DeMoivre, Maclaurin, Landen, Euler, Waring, Lorgna, Bernouilli, Prestet, Ozanam, Kersey, Roberval, Guisnee, Ghetaldus, Pell, Ward, Hammond, Saunderson, Le Gendre, Arbogast, Vince, Waring, Herschel, Babbage, &c. &c.

PART I.

INTRODUCTION.

ALGEBRA is of two kinds, numeral and literal. Algebra, numeral or vulgar, is that of the ancients, which only had place in the resolution of arithmetical questions. In this, the quantity sought is represented by some letter or character; but all the given quantities are expressed by numbers. This is thought by some to have proved an introduction to the art of keeping merchants' accounts by double entry.

Algebra, specious or literal, or the new algebra, is that wherein both the known and unknown quantities are represented by symbols, or by letters of the alphabet. This eases the memory of that effort, otherwise required to keep several matters necessary for the discovery of the object of research, present to the mind: hence, this art may be properly denominated metaphysical geometry.

Quantities which can be measured, are the object of mathematics. They may be divided into two kinds, number and extension. The former is treated of in arithmetic: the latter in geometry. Numbers are ranged in a scale by the continued repetition of some one number, which is called the root; and, in consequence of this order, they are conveniently expressed in words, and denoted by characters. Investigations by common arithmetic are greatly limited, from the want of characters to express the quantities that are unknown, and their relations to each other and to such as are known. Hence letters and other convenient symbols have been introduced to supply this defect; and thus gradually has arisen the science of algebra, or universal arithmetic. In common arithmetic, too, the given numbers disappear in the course of the operation, so that general rules can seldom be derived from it; but, in algebra, the known quantities, as well as the unknown, may be expressed by letters, which, through the whole operation, retain their original form; and hence every particular example furnishes a general rule for all like cases, and the mutual dependence of the several quantities concerned, is always apparent. This general method of expressing quantities, and the general reasonings concerning their connections which may be founded on it, have rendered this science not less useful in the demonstration of theorems, than in the resolution of problems. If geometrical quantities be supposed to be divided into equal parts their relations, or their proportions, may be expressed by numbers; one of these equal parts being denoted by the unit. Arithmetic, however, is used in expressing only the conclusions of geometrical propositions; and it is by algebra that the bounds and application of geometry have, of late, been so far extended. The proper objects of mathematical science are number and extension; but mathematical enquiries may be instituted also concerning any physical quantities, that are capable of being measured or expressed by numbers and extended magnitudes: and as the application of algebra may be equally universal, it has been called the Science of Quantity in general.

DEFINITIONS.

- Known quantities are generally represented by the first letters of the alphabet, as a , b , c , &c. Unknown by the last letters, as x , y , z , &c.
- The sign + (plus) is a mark of addition. Thus $a + b$ denotes the sum of a and b ; $3 + 5$ denotes the sum of 3 and 5; or 8. When no sign is expressed, + is understood.
- The sign - (minus) denotes subtraction. Thus $a - b$ denotes the excess of a above b ; $6 - 2$ is the excess of 6 above 2, or 4.

4. Quantities with the sign + prefixed to them are called positive or affirmative; with the sign - prefixed to them are called negative.

5. The sign \times denotes multiplication. Thus 5×4 means 5 multiplied into 4, or 20; $a \times b$ means a multiplied by b ; and when two letters are adjacent without any mark, multiplication is understood. Thus ab means $a \times b$.

6. \div is the mark of division; thus $a \div b$ means a divided by b : or the quotient of two quantities is denoted by placing the dividend above a small line and the divisor below it in the form of a fraction. Thus $\frac{18}{3}$ is the quotient of 18 divided by 3; or 6.

7. A number prefixed to a letter is called its numeral co-efficient, and it expresses the product of the quantity by that number. When no number is prefixed, unit is understood.

8. A simple quantity consists of one part or term, as $+a, -abc$; a compound quantity consists of more than one term, connected by the signs + or -. Thus $a+b, a-b+c$, are compound quantities. If there are two terms, it is called a binomial; if three, a trinomial, &c.

9. Like quantities consist of the same letter or letters, equally repeated. Thus $+ab, -5ab$, are like quantities; but $+ab, ab+abc$ are unlike.

10. The sign = is the mark of equality. Thus $x+a=b-c$ means, that the sum of x and a is equal to the excess of b above c .

11. When several quantities are multiplied together, any of them is called a factor of the product.

12. The products arising from the continual multiplication of the same quantity are called the powers of that quantity, which is the root. Thus $aa, aaa, aaaa$, &c. are powers of the root a ; and are expressed, by placing above the root, to the right hand, a figure called the index or exponent, denoting how often the root is repeated. Thus,

aa } called the 1st Power of the a^1 or a
 aaa } 2d root a , and is a^2
 $aaaa$ } 3d otherwise ex- a^3
. . . . 4th pressed by a^4

The 2d and 3d powers are generally called the square and the cube; and the 4th, 5th, and 6th, are sometimes respectively called the biquadrate, sursolid, and cubocube.

CHAP. I.

SECT. I. FUNDAMENTAL OPERATIONS.

The fundamental operations in Algebra are performed by addition, subtraction, multiplication, and division.

PROB. I. To add algebraic quantities.

Simple quantities, or the terms of compound quantities, to be added together, may be like with like signs, like with unlike signs, or they may be unlike.

Case 1. To add terms that are like and have like signs.

Rule. Add together the co-efficients, to their sum prefix the common sign, and subjoin the common letter or letters.

Examp.	To	$5ab$	$3aa - ab$
Add	$4ab$	$7aa - 2ab$	$4aa - 5ab$
		$\underline{\quad}$	$\underline{\quad}$
		Sum $9ab$	

$$14aa - 8ab$$

Case 2. To add terms that are like, but have unlike signs.

Rule. Subtract the less co-efficient from the greater, prefix the sign of the greater to the remainder, and subjoin the common letter or letters.

Ex.	-	$4a$	$+ 7bc$	$- 5ab$
	$+ 7a$	$- 3bc$	$+ 2ab$	
		$\underline{\quad}$	$\underline{\quad}$	$\underline{\quad}$
		$+ 3a$	$+ bc$	$+ 3ab$
				$\underline{\quad}$
				$+ 5bc$

*

Case 3. To add terms that are unlike.

Rule. Set them down, one after another, with their signs and co-efficients prefixed.

$$2a + 3b - 5c + 8$$

Compound quantities are added together, by uniting the several terms of which they consist by the preceding rules.

Ex.	The sum of	$5ab - 3xy - 12cd$	$7xy - ab + 15$	$9cd - 4xy - 4mn$
				$\underline{\quad}$
				$is 4ab - 3cd + 15 - 4mn$

PROB. II. To subtract algebraic quantities.

General Rule. Change the signs of the quantity to be subtracted into the contrary signs, and then add it, so changed, to the quantity from which it was to be subtracted; the sum arising by this addition is the remainder.

Ex.	From	$+ 5a$	$7ab - 16bc$
	Subtract	$+ 3a$	$3ab + mb$
			$\underline{\quad}$
		$+ 2a$	$4ab - 16bc - mb$

When a positive quantity is to be subtracted, the rule is obvious. In order to show it, when the negative part of a quantity is to be subtracted, let $c-d$ be subtracted from a , the remainder, according to the rule, is $a-c+d$. For if c is subtracted from a , the remainder is $a-c$; but this is too small, because c is subtracted instead of $c-d$, which is less than it by d ; the remainder therefore is too small by d ; and d being added, it is $a-c+d$, according to the rule.

PROB. III. To multiply algebraic quantities.

General Rule for the Signs. When the signs of the two terms to be multiplied are like, the sign of the product is +; but when the signs are unlike, the sign of the product is -.

Case 1. To multiply two terms.

Rule. Find the sign of the product by the general rule; after it place the product of the numeral co-efficients, and set down the letters one after another.

Mult.	$+ a$	$+ 5b$
	$+ b$	$- 3c$

$$+ ab | - 15bc | + 35aabx$$

The reason of this rule is derived from Def. 5. and from the nature of multiplication, which is a repeated addition of one of the quantities to be multiplied as often as there are units in

the other. Hence also the letters in two terms to be multiplied together may be placed in any order, and therefore the order of the alphabet is generally preferred.

Case 2. To multiply compound quantities.

Rule. Multiply every term of the multiplicand by all the terms of the multiplier, one after another, according to the preceding rule, and then collect all the products into one sum; the sum is the product required.

$$\text{Ex. 1. Mult. } 2a + 3b \\ \text{By } 3ax - 4by$$

$$\begin{array}{r} 6aax + 9abx \\ - 8aby - 12bbx \\ \hline 6aax + 9abx - 8aby - 12bbx \end{array}$$

$$\text{Prod. } 6aax + 9abx - 8aby - 12bbx$$

$$\text{Ex. 2. Mult. } m + x \\ \text{By } m - x$$

$$\begin{array}{r} mm + mx \\ - mx - xx \\ \hline mm * - xx \end{array}$$

$$\text{Prod. } mm * - xx$$

$$\text{Ex. 3. Mult. } a - b \\ \text{By } c - d$$

$$\begin{array}{r} ac - cb \\ - ad + db \\ \hline ac - cb - ad + db \end{array}$$

$$\text{Prod. } ac - cb - ad + db$$

Powers of the same root are multiplied by adding their exponents. Thus, $a^2 \times a^3 = a^5$, or $aa \times aaa = aaaa$, $b^3 \times b = b^4$.

On the General Rule for the Signs.

The reason of the rule will appear from the last mentioned example of $a - b$ multiplied by $c - d$, in which every case of it occurs.

Since multiplication is a repeated addition of the multiplicand, as often as there are units in the multiplier, if $a - b$ is to be multiplied by c , $a - b$ must be added to itself as often as there are units in c , and the product therefore must be $ca - cb$.

But this product is too great; for $a - b$ is to be multiplied, not by c , but by $c - d$ only, which is the excess of c above d ; d times $a - b$ therefore, or $da - db$, has been too much; hence this quantity must be subtracted from the former part of the product, and the remainder, which is $ca - cb - da + db$, will be the true product required.

Scholium.

Sometimes the multiplication of quantities is expressed by setting them down with the sign (\times) between them, without performing the operation according to the preceding rules; thus $a - b \times c - d$ expresses the product of $a - b$, multiplied by $c - d$; and the line drawn over any number of terms of a compound quantity, is called a vinculum, the quantities under the vinculum being collectively considered as one quantity.

Thus also $\overline{a + b}^2$ expresses the second power of $a + b$, or the product of that quantity multiplied by itself; whereas $a + b^2$ would express only the sum of a and b^2 . By some writers a parenthesis () is used as a vinculum, and $(a + b)^2$ is the same thing as $a + b^2$.

PROB. IV. To divide algebraic quantities.

General Rule for the Signs. If the signs of the divisor and dividend are alike, the sign of the quotient is +; if they are unlike, the sign of the quotient is -.

This rule is easily deduced from that given in Prob. III. for, from the nature of division, the quotient must be such a quantity as, multiplied by the divisor, should produce the dividend with its proper sign.

Case 1. When the divisor is simple, and a factor of all the terms of the dividend.

Rule. Expunge the letter or letters in the divisor from each term of the dividend, divide the co-efficient of each term by the co-efficient of the divisor; and the quantity resulting is the quotient.

$$\text{Ex. } a)ab(b. \quad 2a^2b) \quad 6a^2bc - 4a^2bdm \quad (3ac - 2dm.$$

The reason of this is evident from the nature of division, and from Def. 5. Note. It is obvious that powers of the same root are divided by subtracting their exponents.

$$\text{Thus } a^2 a^3 (a. \quad a^3) a^7 (a^4. \quad \text{Also } a^2 b) a^3 b^6 (ab^5.$$

Case 2. When the divisor is simple, but not a factor of the dividend.

Rule. The quotient is expressed by placing the dividend above a line, and the divisor below it.

Thus, the quotient of $3ab$ divided by $2mc$ is the fraction $\frac{3ab}{2mc}$.

Case 3. When the divisor is compound.

Rule 1. Arrange the terms of the dividend according to the powers of some one of its letters; and those of the divisor, according to the powers of the same letter.

Thus, if $a^2 + 2ab + b^2$ is the dividend, and $a + b$ the divisor, they are ranged according to the powers of a .

2. Divide the first term of the dividend by the first term of the divisor; and set this quotient down as a part of the quotient wanted, multiply the whole divisor by it, and subtract the product from the dividend. If nothing remain, the division is finished: consider the remainder, if there is any, as a new dividend.

3. Divide the first term of this new dividend by the first term of the divisor as before, and join the quotient, with its proper sign, to the part already found: then multiply the divisor by this part of the quotient, and subtract the product from the new dividend; and thus the operation is to be continued till no remainder is left.

Thus, a^2 , divided by a , gives a , which is the first part of the quotient wanted: and the product of this part by the whole divisor $a + b$, is $a^2 + ab$, which being subtracted from the given dividend, there remains $ab + b^2$ for a new dividend.

Then, $+ ab$, the first term of the new dividend, divided by a , gives b ; the product of which, by $a + b$, being subtracted from $ab + b^2$, nothing remains, and $a + b$ is therefore the true quotient.

$$\begin{array}{r} a + b) a^2 + 2ab + b^2 (a + b \\ a^2 + ab \\ \hline ab + b^2 \\ ab + b^2 \end{array}$$

$$\frac{1-a}{1-a} \cdot 1(1+a^2+a^4+a^6, \text{ &c.})$$

$$\begin{array}{r} +a \\ +a-a^2 \\ \hline +a^2 \\ +a^2-a^3 \\ \hline +a^3, \text{ &c.} \end{array}$$

$$\frac{45}{45} 63(1$$

$$\begin{array}{r} 18)45(2 \\ 36 \\ \hline 9)18(2 \\ 18 \\ \hline 0 \end{array}$$

In this example there is a remainder, from which the operation may be continued without end; the quotient is called an infinite series. By comparing a few of the first terms, the law of the series may be discovered, and it may be continued to any number of terms wanted.

SECT. II. ON ALGEBRAIC FRACTIONS.

Definition.

In a fraction, the quantity above the line is called the numerator; and that below it is called the denominator.

If both the numerator and denominator of the fraction be either multiplied or divided by the same quantity, the value of that fraction is the same.

Thus, let $\frac{a}{b} = c$, then $\frac{ma}{mb} = c$. For, from the nature of division, if the quotient $\frac{a}{b} (=c)$ be multiplied by the divisor b , the product must be the dividend a . Hence $(\frac{a}{b} \times b) = bc = a$, and likewise $ma = mbc$, and dividing both by mb , $\frac{ma}{mb} = c$. Conversely, if $\frac{ma}{mb} = c$, then also $\frac{a}{b} = c$.

Cor. 1. Hence a fraction may be reduced to another of the same value, but of a more simple form, by dividing both numerator and denominator by any common measure.

$$\text{Thus, } \frac{30ax - 54ay}{12ab} = \frac{5x - 9y}{2b}.$$

Cor. 2. A fraction is multiplied by any integer, by multiplying the numerator, or dividing the denominator by that integer; and conversely, a fraction is divided by any integer, by dividing the numerator, or multiplying the denominator by that integer.

PROB. I. To find the greatest common measure of two quantities.

1. OF PURE NUMBERS.

Rule. Divide the greater by the less; and, if there is no remainder, the less is the greatest common measure required. If there is a remainder, divide the last divisor by it; and thus proceed, continually dividing the last divisor by its remainder, till no remainder is left, and the last divisor is the greatest common measure required. The greatest common measure of 45 and 63 is 9; the greatest common measure of 187 and 391 is 17. Thus,

The rule depends on the two following principles:

1. A quantity which measures both divisor and remainder must measure the dividend.

2. A quantity which measures both divisor and dividend must also measure the remainder.

For a quantity which measures two other quantities, must also measure both their sum and difference; and, from the nature of division, the dividend consists of the divisor repeated a certain number of times, together with the remainder. By the first it appears, that the number found by this rule is a common measure; and, by the second, it is plain there can be no greater common measure; for, if there were, it must necessarily measure the quantity already found less than itself, which is absurd.

When the greatest common measure of algebraical quantities is required, if either of them be simple, any common simple divisor is easily found by inspection. If they are both compound, any common simple divisor may also be found by inspection. But when the greatest compound divisor is wanted, the preceding rule is to be applied; only,

2. The simple divisors of each of the quantities are to be taken out, the remainders in the several operations are also to be divided by their simple divisors, and the quantities are always to be ranged according to the powers of the same letter.

The simple divisors in the given quantities, or in the remainders, do not affect a compound divisor which is wanted; and hence also, to make the division succeed, any of the dividends may be multiplied by a simple quantity. For the simple divisors in the remainders, not being found in the divisors from which they arise, can make no part of the common measure sought; and for the same reason, if in such a remainder there be any compound divisor, which does not measure the divisor from which it proceeds, it may be taken out.

Examples.

$$\begin{array}{r} a^2 - b^2) a^2 - 2ab + b^2 (1 \\ a^2 - b^2 \\ \hline \end{array}$$

$$\begin{array}{r} -2ab + 2b^2 \text{ Remainder which} \\ \text{divided by } -2b \text{ is } a - b) a^2 - b^2 (a + b \\ a^2 - b^2 \\ \hline \end{array}$$

If the quantities given are $8a^2b^2 - 10ab^3 + 2b^4$, and $9a^3b^3 - 9a^3b^2 + 3a^3b^3 - 3ab^4$. The simple divisors being expunged from each, viz. $2b^2$ from the first, it becomes $4a^2 - 5ab + b^2$, and $3ab$ from the second, it is $3a^3b^2 - 3a^3b + ab^2 - b^3$. As the latter is to be divided by the former, it must be multiplied by 4, to make the operation succeed, and then it is as follows:

$$\begin{array}{r} 4x^4 - 5ab + b^3) 12a^3 - 12a^2b + 4ab^2 - 4b^3(3a \\ \hline 12a^3 - 15a^2b + 3ab^2 \\ \hline 3a^2b + ab^2 - 4b^3 \end{array}$$

Divide this remainder by b , and multiply the new dividend by 3, to make the division proceed. Thus,

$$\begin{array}{r} 3a^2 + ab - 4b^2) 12a^2 - 15ab + 3b^2(4 \\ \hline 12a^2 + 4ab - 16b^2 \\ \hline - 19ab + 19b^2 \end{array}$$

This remainder divided by $-19b$, gives $a - b$, which, being made a divisor, divides $3a^2 + ab - 4b^2$ without a remainder, and therefore $a - b$ is the greatest compound divisor; but there is a simple divisor b , and therefore $a - b \times b$ is the greatest common measure required.

PROB. II. To reduce a fraction to its lowest terms.

Rule. Divide both numerator and denominator by their greatest common measure.

Thus, $\frac{75abc}{125bcx} = \frac{3a}{5x}$, 25bc being the greatest common measure; $\frac{a^4 - b^4}{a^5 - a^3b^2} = \frac{a^2 + b^2}{a^3}$.

PROB. III. To reduce an integer to a fraction.

Rule. Multiply the given integer by any quantity for a numerator, and set that quantity under the product for a denominator.

$$\text{Thus, } a = \frac{ma}{m}, a + b = \frac{a^2 - b^2}{a - b}.$$

The denominator of an integer is unity.

PROB. IV. To reduce fractions with different denominators to fractions of equal value, that shall have the same denominator.

Rule. Multiply each numerator, separately taken, into all the denominators but its own, and the products will be the new numerators; and multiply all the denominators for the common denominator.

Example. Let the fractions be $\frac{a}{b}, \frac{c}{d}, \frac{e}{f}$; they are respectively equal to $\frac{adf}{bdf}, \frac{bcf}{bdf}, \frac{bde}{bdf}$.

The reason of the operation appears from the preceding proposition; for the numerator and denominator of each fraction are multiplied by the same quantities; and the value of the fractions therefore is the same.

PROB. V. To add and subtract fractions.

Rule. Reduce them to a common denominator, then add or subtract the numerators; and the sum or difference placed over the common denominator is the sum or remainder required.

VOL. I.

Ex. Add together $\frac{a}{b}, \frac{c}{d}, \frac{e}{f}$, the sum is $\frac{adf + bcf + bde}{bdf}$

From $\frac{a}{b}$ subt. $\frac{c}{d}$ the difference is $\frac{ad - bc}{bd}$.

Cor. 1. Integers and fractions may be added and subtracted by this rule, by considering unity as the denominator of the integers.

Thus, $b + \frac{c}{d} = \frac{bd + c}{d}$, and $a - \frac{a^2 - b^2}{2a} = \frac{2a^2 - a^2 + b^2}{2a} = \frac{a^2 + b^2}{2a}$.

Cor. 2. A fraction, whose numerator is a compound quantity, may be distinguished into parts, by dividing the numerator into several parts, setting each over the original denominator, and uniting the new fractions by the signs of their numerators.

Thus, $\frac{a^2 - 2ab + b^2}{2a} = \frac{a^2}{2a} - \frac{2ab}{2a} + \frac{b^2}{2a} = \frac{a}{2} - b + \frac{b^2}{2a}$.

PROB. VI. To multiply fractions.

Rule. Multiply their numerators together for the numerator of the product; and the denominators, for the denominator of the product.

$$\text{Ex. } \frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd} \quad \frac{a+b}{c} \times \frac{a-b}{d} = \frac{a^2 - b^2}{cd}.$$

Proof. Let $\frac{a}{b} = m$, and $\frac{c}{d} = n$. Then $a = bm$, and $c = dn$, and $ac = bdnm$, and $mn \left(= \frac{a}{b} \times \frac{c}{d} \right) = \frac{ac}{bd}$.

PROB. VII. To divide fractions.

Rule. Multiply the numerator of the dividend by the denominator of the divisor, for the numerator; and the denominator of the dividend by the numerator of the divisor, for the denominator of the quotient.

$$\text{Thus, } \frac{c}{d} \div \frac{a}{b} = \frac{bc}{ad} = \frac{c}{d} \times \frac{b}{a}.$$

Proof. Let $\frac{a}{b} = m$, and $\frac{c}{d} = n$; then $a = bm$, and $c = dn$; also $ad = bdm$ and $bc = bdn$; therefore, $\left(\frac{bdn}{bdm} = \right) \frac{n}{m} = \frac{bc}{ad}$.

CHAP. II.

SECT. I. OF EQUATIONS.

Definitions.

1. An equation is a proposition asserting the equality of two quantities, and is expressed by placing the sign $=$ between them.

2. Equations containing only one unknown quantity and its powers, are divided into orders,

according to the highest power of the unknown quantity to be found in any of its terms.

If the highest power of the unknown quantity in any term be the 1st, 2d, 3d, &c. called Simple, equal, Cubic, &c.

It is here supposed that the exponents of the unknown quantity are integers, and that the equation is cleared of such fractions as the unknown quantity in the denominator.

Thus, $x + a = \frac{3x - b}{c}$ is a simple equation;

$3x - \frac{5}{2x} = 12$, when cleared of the fraction by multiplying both sides by $2x$, becomes $6x^2 - 5 = 24$; is a quadratic, $x^2 - 2x^4 = x^6 - 20$ is an equation of the sixth order, &c.

To resolve an equation is to find the value of the unknown term.

§ 1. Of simple equations, and rules for their resolution.

Rule 1. Any quantity may be transposed from one side of an equation to the other, by changing its sign.

Thus, if $3x - 10 = 2x + 5$

Then, $3x - 2x = 10 + 5$ or $x = 15$

Thus also, $5x + b = a + 2x$

By transp. $3x = a - b$.

For equal quantities are thus added to or subtracted from both sides.

Cor. The signs of all the terms of an equation may be changed into the contrary signs, and it will continue to be true.

Rule 2. Any quantity, by which the unknown quantity is multiplied, may be taken away, by dividing all the other quantities of the equation by it.

Thus, if $ax = b$

$$x = \frac{b}{a}$$

Also, if $mr + nb = am$

$$x + \frac{nb}{m} = a$$

For if equal quantities are divided by the same quantity, the quotients are equal.

Rule 3. If a term of an equation is fractional, its denominator may be taken away by multiplying all the other terms by it.

Thus, if $\frac{x}{a} = b + c$.

$$x = ab + ac$$

Also, if $a - \frac{x}{b} = c$

$$ax - b = cx$$

And by trans. $ax - cx = b$

And by div. $x =$

For if all the terms of the equation are multiplied by the same quantity, the quantities on each side will be equal.

Cor. If any quantity be found on both sides

of the equation, with the same sign, it may be taken away from both.

Also, if all the terms in the equation are multiplied or divided by the same quantity, it may be taken out of them all.

Ex. If $3x + a = a' + b$, then $3x = b$.

If $2ax + 3ab = ma + a^2$, then $2x + 3b = m + a$.

If $\frac{x}{3} - 4 = \frac{16}{3}$, then $x - 4 = 16$.

By these rules the unknown term may be separated from the known, and the equation resolved.

Examples of simple equations resolved by these rules.

Ex. 1. If $3x + 5 = x + 9$

$$\begin{aligned} 2x &= 4 \\ x &= \frac{4}{2} = 2. \end{aligned}$$

Ex. 2. If $5x - \frac{5x}{2} + 12 = \frac{4x}{3} + 26$

$$\begin{aligned} 5x - \frac{5x}{2} - \frac{4x}{3} &= 26 - 12 = 14 \\ 30x - 15x - 8x &= 84. \\ \text{Or } 7x &= 84 \\ x &= \frac{84}{7} = 12. \end{aligned}$$

Ex. 3. If $\frac{5}{x} + \frac{9}{4} = 16$

$$\begin{aligned} \frac{20}{x} + 9 &= 64 \\ 20 + 9x &= 64x \\ 20 &= 64x - 9x = 55x \\ x &= \frac{20}{55} = \frac{4}{11}. \end{aligned}$$

§ 2. Solution of questions producing simple equations.

General Rule. The unknown quantities in the question proposed must be expressed by letters, and the relations of the known and unknown quantities contained in it, or the conditions of it, as they are called, must be expressed by equations. These equations being resolved give the answer to the question.

For example, if the question is concerning two numbers, they may be called x and y , and the conditions from which they are to be investigated must be expressible by equations.

Thus, if it be required that the sum of two numbers sought $x + y = 60$ be 60, that condition is expressed thus:

If their difference must be 24, then $x - y = 24$

If their product is 1640, then $xy = 1640$

If their quotient must be 6, then $\frac{x}{y} = 6$

Case 1. When there is only one unknown quantity to be found.

Rule. An equation involving the unknown quantity must be deduced from the question; and it is obvious, that when there is only one un-

known quantity, there must be only one independent equation contained in the question; for any other would be unnecessary, and might be contradictory to the former.

Example 1. To find a number, to which if there be added a half, a third part, and a fourth part of itself, the sum will be fifty.

Let it be z ; then half of it is $\frac{z}{2}$, a third of it is $\frac{z}{3}$, &c.

$$\begin{aligned} \text{Therefore, } z + \frac{z}{2} + \frac{z}{3} + \frac{z}{4} &= 50 \\ 24z + 12z + 8z + 6z &= 1200 \\ 50z &= 1200 \\ z &= 24 \end{aligned}$$

Case 2. When there are two unknown quantities.

Rule. Two independent equations involving the two unknown quantities, must be derived from the question. A value of one of the unknown quantities must be derived from each of the equations; and these two values being put equal to each other, a new equation will arise, involving only one unknown quantity.

Example 2. Two persons, A and B, were talking of their ages: says A to B, seven years ago I was just three times as old as you were, and seven years hence I shall be just twice as old as you will be. What are their present ages?

Let A's age = x , and B's age = y ; then by the condition of the question we have

$$x - 7 = 3 \cdot y - 7 \text{ and } x + 7 = 2 \cdot y + 7.$$

Subtracting the first of these equations from the second, we have

$$\begin{aligned} 2 \cdot y + 7 - 3 \cdot y - 7 &= 14; \\ \text{or } 7 - y &= 14, \text{ or } y = 21. \end{aligned}$$

Whence $x = 49$.

The ages of A and B then are forty-nine and twenty-one.

Example 3. A gentleman distributing money among some poor people, found he wanted ten shillings to be able to give five shillings to each; he therefore gave each four shillings only, and found he had five shillings left. To find the number of shillings and poor people.

If any question such as this, in which there are two quantities sought, can be resolved by means of one letter, the solution is, in general, more simple than when two are employed. There must be, however, two independent conditions; one of which is used in the notation of one of the unknown quantities, and the other gives an equation.

Let the number of poor = z , then each of the equations $5z - 10$ and $4z + 5$ will represent the number of shillings.

Hence $5z - 10 = 4z + 5$, whence $z = 15$, and, consequently, the number of shillings is sixty-five.

Case 3. When there are three or more unknown quantities.

Rule. When there are three unknown quantities, there must be three independent equations arising from the question; and from each of

these a value of one of the unknown quantities must be obtained. By comparing these three values, two equations will arise, involving only two unknown quantities; and in like manner may the rule be extended to such questions as contain four or more unknown quantities. Hence, it may be inferred, that when just as many independent equations may be derived from a question as there are unknown quantities in it, these quantities may be found by the resolution of equations.

Example 4. To find three numbers, such, that the first, with half the other two, the second with one third of the other two, and the third with one fourth of the other two, may each be equal to thirty-four.

Let the numbers be x , y , z , and the equations are

$$\begin{aligned} x + \frac{y+z}{2} &= 34, \\ y + \frac{x+z}{3} &= 34, \\ \text{and } z + \frac{x+y}{4} &= 34. \end{aligned}$$

We have, hence,

$$\begin{aligned} x &= 34 - \frac{y+z}{2}, \\ x &= 102 - 3y - z, \\ \text{and } x &= 136 - 4z - y. \\ \text{By equating the first two of these latter equations,} \\ \text{we find } y &= \frac{136 - z}{5}; \text{ by equating the last two,} \\ \text{we find } y &= 3z - 34 \\ \text{Hence } \frac{3z - 34}{2} &- \frac{136 - z}{5} = 0, \\ 15z - 170 &= 272 - 2z, \text{ or } 17z = 442, \text{ or } z = 26; \\ \text{whence } y &= 22 \text{ and } x = 10. \end{aligned}$$

Scholium.

On many occasions, by particular contrivances, the operations by the preceding rules may be much abridged. This, however, must be left to the skill and practice of the learner. A few examples are the following.

1. It is often easy to employ fewer letters than there are unknown quantities, by expressing some of them from their relation to others, contained in the conditions of the question.

2. Sometimes it is convenient to express by letters, not the unknown quantities themselves, but some other quantities connected with them, as their sum, difference, &c. from which they may be easily derived.

3. In the operation, also, circumstances will sometimes suggest a more easy method than that pointed out by the general rules. Two of the original equations may be added together, or may be subtracted; sometimes they must be previously multiplied by some quantity, to render some addition or subtraction effectual, in exterminating one of the unknown quantities, or otherwise facilitating the solution. Substitutions may be made of the values of quantities, in place of quantities themselves, and various other

such contrivances may be used, to render the solution less complicated.

SECT. II. GENERAL SOLUTION OF PROBLEMS.

In the solutions of the questions in the preceding part, the given quantities (being numbers) disappear in the last conclusion, so that no general rules for the like cases can be deduced from them. But if letters be used to denote the known, as well as the unknown, quantities, a general solution will be obtained, because during the whole course of the operation, they retain their original form. Hence, also, the connection of the quantities will appear, in such a manner as to discover the necessary limitations of the data, when there are any, which is necessary to the perfect solution of a problem.

Example 5. To find two numbers, of which the sum and difference are given.

Let s be the sum given, and d the given difference. Also, let x and y be the two numbers sought.

Then $x + y = s$ and $x - y = d$, whence $x = s - y$ and $x = d + y$, consequently $d + y = s - y$, or $2y = s - d$, or $y = \frac{s - d}{2}$; and hence $x = \frac{s + d}{2}$.

Thus, let the given sum be 100, and the difference 24.

$$\text{Then } x = \frac{s+d}{2} = \frac{124}{2} = 62.$$

$$\text{And } y = \frac{s-d}{2} = \frac{76}{2} = 38.$$

CHAP. III.

OF INVOLUTION AND EVOLUTION

Lemma.

The reciprocals of the powers of a quantity may be expressed by that quantity, with negative exponents of the same denominator. That is, the series $a, 1, \frac{1}{a}, \frac{1}{a^2}, \frac{1}{a^3}, \dots$, &c. may be expressed by $a^1, a^0, a^{-1}, a^{-2}, a^{-3}, a^{-4}, \dots$, &c.

For the powers of the same root are divided by subtracting their exponents; if then the index of the divisor be greater than that of the dividend, the index of the quotient will be negative.

$$\text{Thus, } \frac{a}{a^3} = a^{2-3} = a^{-1}$$

$$\text{Also, } \frac{a^2}{a^3} = \frac{1}{a^1}, \quad \frac{a^m}{a^m} = a^{m-m} = a^0.$$

$$\text{Also, } \frac{a^m}{a^n} = 1, \text{ and so on of others.}$$

Cor. These negative powers, as they are called, are multiplied by adding, and divided by subtracting, the exponents.

$$\text{Thus, } a^{-2} \times a^{-3} = a^{-5}.$$

$$\text{Or, } \frac{1}{a^2} \times \frac{1}{a^3} = \frac{1}{a^5} = a^{-5}.$$

$$\frac{-1}{-3} = a. \quad \text{Or } \frac{1}{a^3} \cdot \frac{1}{a} = \left(\frac{a^3}{a}\right) \frac{1}{a} = a^0.$$

1. Of Involution.

To find any power of a quantity is the business of involution.

Case 1. When the quantity is simple.

Rule. Multiply the exponent of the letters by the index of the power required, and raise the co-efficient to the same power.

Thus, the second power of a is $a^{1 \times 2} = a^2$.

The third power of $2a^2$ is $8a^{2 \times 3} = 8a^6$.

For the multiplication would be performed by the continual addition of the exponents; and this multiplication of them is equivalent.

If the sign of the given quantity is $+$, all its powers will be positive. If the sign is $-$, then the powers whose exponents are even numbers are positive; and those whose exponents are odd numbers are negative.

This is obvious from the rule for the signs in multiplication.

Case 2. When the quantity is compound.

Rule. The powers must be found by a continual multiplication of the quantity by itself.

Thus the square of $x + \frac{a}{2}$ found by multiplying it into itself is $x^2 + ax + \frac{a^2}{4}$. The cube is got by multiplying the square already found by the root, &c.

The involution of compound quantities is rendered much easier by the binomial theorem; for which see Chap. VII.

2. Of Evolution.

Evolution is the reverse of involution, and by it powers are resolved into their roots.

Def. The root of any quantity is expressed by placing before it $\sqrt{}$ (called a radical sign) with a small figure above it, denoting the denominator of that root.

Thus, the square root of a is \sqrt{a} or $\sqrt[2]{a}$.

The cube root of bc is $\sqrt[3]{bc}$.

The fourth root of $a^2b - x^3$, is $\sqrt[4]{a^2b - x^3}$.

The m th root of $c^2 - dx$, is $\sqrt[m]{c^2 - dx}$.

General rules for the signs.

1. The root of any positive power may be either positive or negative, if it is denominated by an even number; if the root is denominated by an odd number, it is positive only.

2. If the power is negative, the root also is negative, when it is denominated by an odd number.

3. If the power is negative, and the denomination of the root even, then no root can be assigned.

This rule is derived from the change of signs in multiplication. When the quantity, whose root is to be found, is negative, it is convenient

to set the radical sign before the negative quantity, and then it is called an impossible or imaginary root

Thus, the square root of $-a^2$ is denoted $\sqrt{-a^2}$.

The root of a positive power, denominated by an even number, has often the sign \pm before it, denoting that it may have either + or -.

Case 1. When the quantity is simple.

Rule. Divide the exponents of the letters by the index of the required root, and prefix the root of the numerical co-efficient.

1. The exponents of the letters may be multiples of the index of the root, and the root of the co-efficient may be extracted

Thus, the square root of $a^4 = a^{\frac{4}{2}} = \pm a^2$.

$$\sqrt{27a^6} = 3a^{\frac{6}{2}} = 3a^3.$$

2. The exponents of the letters may not be multiples of the index of the root, and then they become fractions; and when the root of the co-efficient cannot be extracted, it may also be expressed by a fractional exponent, its original index being understood to be 1.

$$\text{Thus, } \sqrt{16a^3b^2} = 4a^{\frac{3}{2}}b$$

$$\sqrt[3]{7ax^3} = 7^{\frac{1}{3}}a^{\frac{1}{3}}x = xa^{\frac{1}{3}}\sqrt[3]{7}.$$

Case 2. When the quantity is compound.

1. To extract the square root.

Rule. 1. Range the given quantity according to the powers of some letter, as in division.

2. Extract the square root of the first term from the first part of the root sought. Subtract its square from the given quantity, and divide the first term of the remainder by double the part already found, and the quotient is the second term of the root.

3. Add this second part to double of the first, and multiply the sum by the second part: subtract the product from the last remainder, and if nothing remain, the square root is obtained. But if there is a remainder, it must be divided by the double of the parts already found, and the quotient will give the third part of the root; and so on.

The operation is as follows.

$$\begin{array}{r} a^2 + 2ab + b^2 \\ a^2 \end{array}$$

$$\begin{array}{r} 2a + b \\ \times b \end{array} \quad \begin{array}{r} 2ab + b^2 \\ 2ab + b^2 \end{array}$$

$$x^4 - ax^2 + \frac{a^2}{4} \left(x^2 - \frac{a}{2} \right)$$

$$\begin{array}{r} 2x^2 - \frac{a}{2} \\ \times - \frac{a}{2} \end{array} \quad \begin{array}{r} - ax^2 + \frac{a^2}{4} \\ - ax^2 + \frac{a^2}{4} \end{array}$$

The reason of this rule appears from the composition of a square.

2. To extract any other root.

Rule. Range the quantity according to the dimensions of its letters, and extract the required root of the first term, and it will be the first member of the root required. Then raise this root to a dimension lower by unity than the number that denotes the required root, and multiply the power that arises by that number itself. Divide the second term of the given quantity by the product, and the quotient will be the second member of the root required. In like manner are the other parts to be found, by considering those already got as making one term.

$$\text{Thus, the fifth root of } a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5(a + b)^4$$

$$5a^4) 5a^4b$$

And $a + b$ raised to the fifth power is the given quantity, and therefore it is the root sought.

It often happens, that the operation will not terminate, and the root will be expressed by a series.

Thus, the square root of $a^2 + x^2$ becomes a series.

$$a^2 + x^2(a + \frac{x^2}{2a} - \frac{x^4}{8a^3} + \frac{x^6}{16a^5}, \text{ &c.})$$

a^2

$$\begin{array}{r} 2a + \frac{x^2}{2a} \\ \times \frac{x^2}{2a} \end{array} \quad \begin{array}{r} x^2 \\ = x^2 + \frac{x^4}{4a^2} \end{array}$$

$$\begin{array}{r} 2a + \frac{x^2}{a} - \frac{x^4}{8a^3} \\ \times - \frac{x^4}{8a^3} \end{array} \quad \begin{array}{r} - \frac{x^4}{4a^2} \\ = - \frac{x^4}{4a^2} - \frac{x^6}{8a^4} + \frac{x^8}{64a^6}, \end{array}$$

$$\frac{x^6}{8a^4} + \frac{x^8}{64a^6}, \text{ &c.}$$

3. Of Surds.

Def. Quantities with fractional exponents are called surds, or imperfect powers.

Such quantities are also called irrational; in opposition to others with integral exponents, which are called rational.

The operations concerning surds depend on the following principle: If the numerator and denominator of a fractional exponent be both multiplied or both divided by the same quantity, the value of the power is the same.

Lemma. A rational quantity may be put into the form of a surd, by reducing its index to the form of a fraction of the same value.

$$\begin{array}{l} \text{Thus, } a = a^{\frac{3}{2}} = \sqrt{a^3} \\ a^3b = a^{\frac{3}{2}}b^{\frac{3}{2}} = \sqrt[3]{a^3b^3}. \end{array}$$

PROB. I. To reduce surds of different denominators to others of the same value, and of the same denomination.

Rule. Reduce the fractional exponents to others of the same value, and having the same common denominator.

Example. $\sqrt{a}, \sqrt[3]{b^2}$ or $a^{\frac{1}{2}}, b^{\frac{2}{3}}$;

but $a^{\frac{1}{2}} = a^{\frac{3}{6}}$ and $b^{\frac{2}{3}} = b^{\frac{4}{6}}$,

therefore \sqrt{a} , and $\sqrt[3]{b^2}$ are respectively equal to

$\sqrt[6]{a^3}$ and $\sqrt[6]{b^4}$.

PROB. II. To multiply and divide surds.

1. When they are surds of the same rational quantity, they are multiplied by adding, and divided by subtracting, their exponents.

Thus, $a^{\frac{1}{2}} \times a^{\frac{3}{4}} = a^{\frac{1}{2} + \frac{3}{4}} = a^{\frac{5}{4}} = \sqrt[4]{a^5}$.

2. If they are surds of different rational quantities, let them be brought to others of the same denomination. Then, by multiplying or dividing these rational quantities their product or quotient may be set under the common radical sign.

Thus, $\sqrt[n]{a} \times \sqrt[m]{b} = a^{\frac{1}{n}} b^{\frac{1}{m}} = \sqrt[nm]{ab}$.

$$\frac{\sqrt{a^2 - b^2}}{\sqrt{a + b}} = \sqrt{\frac{a^2 - b^2}{a + b}} = \sqrt{a - b}.$$

If the surds have any rational co-efficients, their product or quotient must be prefixed.

$$\text{Thus, } a\sqrt{m} \times b\sqrt{n} = ab\sqrt{mn}.$$

Cor. If a rational co-efficient be prefixed to a radical sign, it may be reduced to the form of a surd by the lemma; and conversely, if the quantity under the radical sign be divisible by a perfect power of the same denomination, it may be taken out, and its root prefixed as a co-efficient.

$$a\sqrt{b} = \sqrt{a^2 b}; 2 \times \sqrt[3]{a} = \sqrt[3]{8a}$$

$$\text{Converse } \sqrt{a^2 b^3} = ab\sqrt{b}; \sqrt{4a^2 - 8a^2 b} = 2a\sqrt{1 - 2b}.$$

Even when the quantity under the radical sign is not divisible by a perfect power, it may be useful sometimes to divide surds into their component factors by reversing the operation of this problem.

$$\text{Thus, } \sqrt{ab} = \sqrt{a} \times \sqrt{b}, \sqrt[3]{a^2 b} = \sqrt{b} \times \sqrt[3]{a^2} =$$

$$b^{\frac{1}{3}} \times \sqrt[3]{a^2} \times \sqrt[3]{a + x}.$$

PROB. III. To involve or evolve surds.

This is performed by the same rules as in other quantities, by multiplying or dividing their exponents by the index of the power or root required.

Scholium.

If a member of an equation be a surd root, then the equation may be freed from any surd, by bringing that member first to stand alone

upon one side of the equation, and then taking away the radical sign from it, and raising the other side to the power denoted by the index of that surd.

Example. If $3\sqrt{x^2 - a^2} + 2y = a + y$.

$$\text{Then } 3\sqrt{x^2 - a^2} = a - y.$$

$$\text{And } 9 \times x^2 - a^2 = a^2 - 2ay + y^2.$$

If the unknown quantity be found only under the radical sign, and only of the first dimension, the equation becomes simple.

Thus, if $\sqrt[3]{4x + 16} + 5 = 9$

$$\text{Then } \sqrt[3]{4x + 16} = 4$$

$$\text{And } 4x + 16 = 64$$

$$4x = 48$$

$$\text{And } x = 12$$

$$\text{If } \sqrt[m]{a^2 x - b^2 x} = a$$

$$\text{Then } a^2 x - b^2 x = a^m$$

In general if $x^{\frac{p}{q}} + x^{\frac{r}{s}} = a$, by reducing the surds to the same denomination $x^{\frac{ps}{qs}} + x^{\frac{qr}{qs}} = a$,

and making $x^{\frac{ps}{qs}} = z$, the equation is $z^{qs} + z^{qr} = a$, in which the exponents of z are integers; and z being found, x is to be found from the equation

$$x^{\frac{1}{qs}} = z.$$

CHAP. V.

OF QUADRATIC EQUATIONS.

Quadratic equations are either pure or affected.

Definitions.

1. A pure equation is that in which only one power of the unknown quantity is found.

2. An affected equation is that in which different powers of the unknown quantity are found in the several terms.

Thus, $a^2 + ax^2 = b^3, ax^2 - b^2 = m^2 + x^2$ are pure equations.

$$x^2 - ax = b^2, x^3 + x^2 = 17.$$

are affected equations.

Solution of Pure Equations.

Rule. Make the power of the unknown quantity to stand alone by the rules formerly given, and then extract the root of the same denomination on both sides, and the value of the unknown quantity will be obtained.

Examples.

$$\text{If } a^2 - ax^2 = b^3 \quad ax^m - b = x^m - c$$

$$ax^2 = b^3 - a^2 \quad ax^m = x^m - b - c$$

$$x^2 = \frac{b^3 - a^2}{a^2} \quad x^m = \frac{b - c}{a - 1}$$

$$= \sqrt{\frac{b^3 - a^2}{a^2}} \quad = \sqrt{\frac{b - c}{a - 1}}$$

Solution of affected quadratic equations.

An affected quadratic equation (commonly called a quadratic) involves the unknown quantity itself and also its square.

Rule 1. Transpose all the terms involving the unknown quantity to one side, and the known terms to the other; and so that the term containing the square of the unknown quantity may be positive.

2. If the square of the unknown quantity is multiplied by any co-efficient, divide all the terms of the equation by it, so that the co-efficient of the square of the unknown quantity may be 1.

3. Add to both sides the square of half the co-efficient of the unknown quantity, and the side of the equation involving the unknown quantity will be a complete square.

4. Extract the square root from both sides of the equation, and by transposing the above-mentioned half co-efficient, the value of the unknown quantity will be obtained.

The reason of this rule is manifest from the composition of the square of a binomial, for it consists of the squares of the two parts, and twice the product of the two parts.

The different forms of quadratic equations, expressed in general terms, being reduced by the first and second parts of the rule, are these.

$$1. x^2 + ax = b^2$$

$$2. x^2 - ax = b^2$$

$$3. x^2 - ax = -b^2$$

$$\text{Case 1. } x^2 + ax = b^2 \quad x^2 + ax + \frac{a^2}{4} = b^2 + \frac{a^2}{4}$$

$$x + \frac{a}{2} = \pm \sqrt{b^2 + \frac{a^2}{4}}$$

$$x = \pm \sqrt{b^2 + \frac{a^2}{4}} - \frac{a}{2}$$

$$\text{Case 2. } x^2 - ax = b^2 \quad x^2 - ax + \frac{a^2}{4} = b^2 + \frac{a^2}{4}$$

$$x - \frac{a}{2} = \pm \sqrt{b^2 + \frac{a^2}{4}}$$

$$x = \frac{a}{2} \pm \sqrt{b^2 + \frac{a^2}{4}}$$

$$\text{Case 3. } x^2 - ax = -b^2 \quad x^2 - ax + \frac{a^2}{4} = \frac{a^2}{4} - b^2$$

$$a - \frac{a}{2} = \pm \sqrt{\frac{a^2}{4} - b^2}$$

$$x = \frac{a}{2} \pm \sqrt{\frac{a^2}{4} - b^2}$$

1. Every quadratic equation will have two roots, except those of the third form, whose roots become impossible.

2. In the first two forms, one of the roots will be positive, and the other negative.

3. In the third form, if $\frac{a^2}{4}$, or the square of half the co-efficient of the unknown quantity, be greater than b^2 , the known quantity, the two

roots will be positive. If $\frac{a^2}{4}$ be equal to b^2 , the two roots become equal; but if $\frac{a^2}{4}$ is less than b^2 , the quantity under the radical sign becomes negative and the two roots are impossible.

4. If the equation express the relation of magnitudes abstractedly considered, where a contrariety cannot be supposed to take place, the negative roots cannot be of use, or rather there are no such roots; for then a negative quantity by itself is unintelligible, and therefore the square root of a positive quantity must be positive only.

Solution of questions producing quadratic Equations.

Example 1. One laid out a certain sum of money in goods, which he sold again for twenty-four pounds, and gained as much per cent. as the goods cost him. What did they cost him?

Let the money laid out = y , then $24 - y$ is the gain; and $y : 24 - y :: 100 : \frac{2400 - 100y}{y}$ = the gain per cent. which by the question is equal to y .

$$\text{Hence } y = \frac{2400 - 100y}{y},$$

$$\text{or } y^2 = 2400 - 100y,$$

$$\text{or } y^2 + 100y = 2400;$$

whence, by adding to each side of the equation 2500, the square of $\frac{100}{2}$,

we have $y^2 + 100y + 2500 = 4900$; and hence, by extracting the square root, we have $y + 50 = \pm 70$, or $y = \pm 70 - 50 = 20$, or -120 . The answer therefore is 20, the negative result from the nature of the problem being excluded.

The answer is twenty pounds, which succeeds. The other root, -120 , has no place in this example, a negative number being here unintelligible.

Example 2. To find two numbers whose sum is 100, and whose product is 2059.

Let the given sum 100 = a the product 2059 = b , and let one of the numbers sought be x , the other will be $a - x$, and their product

$$ax - x^2 = b,$$

$$\text{or } x^2 - ax = -b;$$

and, by completing the square, we have

$$x^2 - ax + \frac{a^2}{4} = \frac{a^2}{4} - b.$$

Then, by extracting the square root, there results

$$-\frac{a}{2} = \pm \sqrt{\frac{a^2}{4} - b}$$

$$\text{Whence } x = \frac{a}{2} \pm \sqrt{\frac{a^2}{4} - b} =$$

$$a \pm \sqrt{a^2 - 4b}$$

By substituting for a and b their numerical values as given in the question we find $x = 71$ or 29 .

and $a - x = 29$ or 71 , which are the two numbers required.

But in this example, by a different mode of substitution, an affected equation may be avoided. Let a = half the sum, and x = half the difference of the required numbers; then the numbers will be represented by $a + x$ and $a - x$.

Hence $a+x \cdot a-x = b$, or $a^2 - x^2 = b$; whence $x = \pm \sqrt{a^2 - b}$ (with the given numbers) 21 ; whence the numbers are as before 71 and 29 .

In the first solution it may be observed, that b must not be greater than $\frac{a^2}{4}$, for the roots of the equation would then be impossible; that is, the given product must not be greater than the square of half the given sum of the numbers sought. This limitation can easily be shown from other principles; for the greatest product of the two parts into which any number may be divided, is, when each of them is a half of it. If b be equal to $\frac{a^2}{4}$, there is only one solution, viz.

$$x = \frac{a}{2}, \text{ also } a - x = \frac{a}{2}.$$

CHAP. VI.

OF INDETERMINATE PROBLEMS.

It has already been observed, that if there are more unknown quantities in a question than equations, by which their relations are expressed, the question is indetermined. The method of solving such problems may be better learnt by examples than by any general rules; and, indeed, no general rules can be given for the purpose, each individual example forming in itself an especial and distinct case.

Example 1. To divide a given square number into two parts, each of which shall be a square number.

There are two quantities sought in this question, and there is only one equation expressing their relation; but it is required also that they may be rational, which circumstance cannot be expressed by an equation: another condition, therefore, must be assumed, to obtain a solution in rational numbers.

Let the given square be a^2 ; let one of the squares sought be x^2 , the other is $a^2 - x^2$. Let $rx - a$ also be a side of the last square, therefore $r^2x^2 - 2rxa + a^2 = a^2 - x^2$ by transp. $r^2x^2 + x^2 = 2rxa$ divide by x $r^2x + x = 2ra$

$$\text{Therefore } x = \frac{2ra}{r^2 + 1}$$

$$\text{And } rx - a = \frac{2r^2a^2}{r^2 + 1} - a \\ = \frac{r^2 - 1}{r^2 + 1} a$$

Let r therefore be assumed at pleasure, and then three of the required conditions are fulfilled.

$\frac{2ra}{r^2 + 1}, \frac{r^2 - 1}{r^2 + 1} a$, which must always be rational, will be the sides of the two squares required.

Thus, if $a^2 = 100$; then if $r^2 = 3$, the sides of the two squares are 6 and 8 , for $36 + 64 = 100$.

Also, let $a^2 = 64$. Then if $r = 2$, the sides of the squares are $\frac{32}{5}$ and $\frac{24}{5}$; and $\frac{1024}{25} + \frac{576}{25} = 1600 = 64$.

The reason of the assumption of $rx - a$ as a side of the square $a^2 - x^2$, is, that being squared and put equal to this last, the equation manifestly will be simple, and the root of such an equation is always rational.

Example 2. To find two square numbers whose difference is given.

Let x^2 and y^2 be the square numbers, and a their difference.

$$\text{Put } \frac{z + v}{2} = x,$$

$$\text{and } \frac{z - v}{2} = y,$$

$$\frac{z^2 + 2zv + v^2}{4} = x^2$$

$$\frac{z^2 - 2zv + v^2}{4} = y^2$$

$$zv = a.$$

If x and y are required only to be rational, then take v at pleasure, and $z = \frac{a}{v}$, whence x and y are known.

But if x and y are required to be whole numbers, take for z and v any two factors that produce a , and are both even, or both odd numbers. And this is possible only where a is either an odd number greater than 1 , or a number divisible by 4 . Then $\frac{z + v}{2}$ and $\frac{z - v}{2}$ are the numbers sought.

For the product of two odd numbers is odd, and that of two even numbers is divisible by 4 .

Also if z and v are both odd, or both even, $\frac{z + v}{2}$ and $\frac{z - v}{2}$ must be integers.

Example 1. If $a = 27$, take $v = 1$, then $z = 27$, and the squares are 196 and 169 . Or z may be 9 and $v = 3$, and then the squares are 36 and 9 .

2. If $a = 12$, take $v = 2$, and $z = 6$; and the squares are 16 and 4 .

Example 3. Find three integral affirmative numbers, of which the sum of all three shall be a cube, and the sum of every two a square number.

Let x , y and z represent the numbers, and let $x + y = m^2 a^2$, $x + z = m^2 b^2$, and $y + z = m^2 c^2$,

and there remains only to make

$$x + y + z = \frac{m^3}{2} (a^2 + b^2 + c^2) \text{ a cube,}$$

which it is when $m = \frac{1}{2}(a^2 + b^2 + c^2)$,
in which case $x = m^2(m - c^2)$,

$$y = m^2(m - b^2),$$

$$\text{and } z = m^2(m - a^2);$$

where a^2, b^2, c^2 must be so taken that the sum of every two of them may be greater than the third. If $a = 5, b = 6$, and $c = 7$, then $m = 55, x = 18150, y = 57475$, and $z = 90750$.

As an example of the various ways in which questions of this kind may be considered, we add another solution of this question.

Let the numbers be represented by

$$2(x^2 + y^2 - z^2),$$

$$2(x^2 + z^2 - y^2),$$

$$\text{and } 2(z^2 + y^2 - x^2);$$

$$\text{then } 2(x^2 + y^2 + z^2) = a^3.$$

Put $a = 2p^3$,
then $x^2 = 4p^6 - y^2 - z^2 = n^2 - z^2$ (if n^2 be put for $4p^6 - y^2$). Assume

$$n^2 - z^2 = mz - n^2 = m^2z^2 - 2mnz + n^2,$$

$$\text{then } z = \frac{m^2 + 1}{2mn}.$$

$$\text{As } n^2 = 4p^6 - y^2, y^2 = 4p^6 - n^2.$$

Let this be assumed

$$= (cn - 2p^3)^2 = c^2n^2 - 4cp^3n + 4p^6,$$

$$\text{then } n = \frac{c^2 + 1}{4p^3c},$$

$$y = cn - 2p^3,$$

$$z = \frac{m^2 + 1}{2mn}$$

and $x = mz - n$, z being found from the previous expression.

On continued fractions.

A continued fraction is one which has for its denominator a mixed number, or a whole number and a fraction, which fraction has, in like manner, for its denominator, a whole number and a fraction, &c.

One of the greatest practical advantages derivable from the properties of formulae of this class, is, in approximating to the values of ratios, which are expressed by large numbers, which is effected by dividing the greater number by the less, the last divisor by the last remainder, &c. as in finding the greatest common measure of two numbers; the several quotients thus obtained being the denominators of the fractions, their numerators being always units.

Thus, to represent $\frac{a}{b}$ by a continued fraction, let b be contained in a, p times with a remainder c ; let c be contained in b, q times with a remainder d ; d in c, r times with a remainder e , &c. as in the following operation.

b) $a(p)$

c) $b(q)$

d) $c(r)$

e) $d(s)$

f, &c.

Then, we have $\frac{a}{b} = p + \frac{c}{q}$,

$$\frac{c}{q} = q + \frac{d}{r}$$

$$\frac{d}{r} = r + \frac{e}{s} \text{ &c.}$$

where $p, q, r, &c.$ are called quotients,

and $p + \frac{c}{b}, q + \frac{d}{c}, &c.$ complete quotients.

And b being again divided by c , c by d , d by e , &c. we shall, by successive substitution, have

$$\frac{a}{b} = p + \frac{c}{b} = p + \frac{1}{\frac{q}{\frac{d}{r + \frac{e}{s}}}} = p + \frac{1}{\frac{q}{\frac{1}{\frac{1}{r + \frac{e}{s}}}}} = p + \frac{1}{\frac{q}{\frac{1}{\frac{1}{s}}}},$$

and, by extending the number of terms, we have

$$\frac{a}{b} = p + \frac{1}{q + \frac{1}{r + \frac{1}{s}}},$$

A continued fraction may be converted into its equivalent vulgar fraction by adding together a few of its leading terms, and observing the law of their formation.

Thus, if it were required to find a series of vulgar fractions successively approximating to the continued fraction.

$$x = a + \frac{1}{\beta + \frac{1}{\gamma + \frac{1}{\delta}}},$$

we have, first,

$$a = \frac{a}{1}, a + \frac{1}{\beta} = \frac{a\beta + 1}{\beta},$$

$$a + \frac{1}{\beta + \frac{1}{\gamma}} = a + \frac{\gamma}{\beta\gamma + 1} = \frac{(a\beta + 1)\gamma + a}{\beta\gamma + 1},$$

$$a + \frac{1}{\beta + \frac{1}{\gamma + \frac{1}{\delta}}} = a + \frac{1}{\beta + \frac{\delta}{\gamma\delta + 1}} =$$

$$\frac{(a\beta + 1)\gamma + a}{\beta\gamma + 1} \times \frac{\delta}{\delta + \beta} + \frac{a\beta + 1}{\beta\gamma + 1} + \frac{1}{\delta + \beta},$$

Now the law of continuation of these successive fractions, may easily be discovered if the quotients $a, \beta, \gamma, \delta, &c.$ be placed in a line over the results, as follows:

$$\frac{1}{0}, \frac{a}{1}, \frac{\beta}{1}, \frac{\gamma}{1}, \frac{\delta}{1}, \frac{a\beta + 1}{\beta}, \frac{a\beta + \gamma + a}{\beta\gamma + 1}, \frac{a\beta + \gamma + \delta + a}{\beta\gamma + 1}, &c.$$

for it is evident that the product of each numerator, and the quotient above it, added to the preceding numerator, gives the numerator next following; and in like manner, the product of each denominator, and the quotient above it, added to the preceding denominator, gives the next succeeding denominator.

As an example of the application of continued fractions, let it be required to exhibit a series of fractions approximating to the ratio which the

diameter of a circle bears to its circumference, that ratio being expressed by the fraction $\frac{314159}{100000}$. By successive division, we find

$$\alpha = 3, \beta = 7, \gamma = 1, \delta = 1, \text{ &c.}$$

$$\text{Hence } \frac{\alpha}{1} = \frac{3}{1}, \frac{\alpha\beta + 1}{\beta} = \frac{22}{7},$$

$$\frac{\frac{\alpha\beta + 1}{\beta} \cdot \gamma + \alpha}{\beta\gamma + 1} = \frac{25}{8},$$

$$\frac{(\alpha\beta + 1) \cdot \gamma + \alpha}{\beta\gamma + 1} \cdot \delta + \alpha\beta + 1 = \frac{47}{15}, \text{ &c.}$$

the successive fractions being $\frac{3}{1}, \frac{22}{7}, \frac{25}{8}, \frac{47}{15}, \frac{72}{23}, \frac{191}{61}$, all fractions of small terms approximating to the given one.

CHAP. VII.

I. OF ARITHMETICAL SERIES.

Def. When quantities increase or decrease by the same common difference, they form an arithmetical series. Thus, $a, a+b, a+2b, a+3b, \text{ &c.}$ $x, x-b, x-2b, \text{ &c.}$ Also $1, 2, 3, 4, 5, 6, \text{ &c.}$ and $8, 6, 4, 2, \text{ &c.}$

Prop. In an arithmetical series, the sum of the first and last terms is equal to the sum of any two intermediate terms, equally distant from the extremes.

Let the first term be a , the last x , and b the common difference; then $a+b$ will be the second, and $x-b$ the last but one, &c.

Thus, $a, a+b, a+2b, a+3b, a+4b, \text{ &c.}$
 $x, x-b, x-2b, x-3b, x-4b, \text{ &c.}$

It is plain, that the terms in the same perpendicular rank are equally distant from the extremes; and that the sum of any two in it is $a+x$, the sum of the first and last.

Cor. 1. Hence the sum of an arithmetical series is equal to the sum of the first and last terms multiplied into half the number of terms.

If n be the number of terms, and s the sum of the

series: $s = \overline{a+x} \times \frac{n}{2}$. If $a=0$, then $s = \frac{nx}{2}$.

Cor. 2. $x = a + \overline{n-1} \times b$, and $s = \overline{2a + }$

$$\overline{n-1} \times b \times \frac{n}{2}, \text{ or, } s = \frac{2an + n^2b - nb}{2}.$$

Cor. 3. Of the first term, common difference, sum, and number of terms, any three being given, the fourth may be found by resolving the preceding equation; a, b, s , and n , being successively considered as the unknown quantity. In the first three cases the equation is simple, and in the last it is quadratic.

II. OF GEOMETRICAL SERIES.

Def. When quantities increase by the same multiplier, or decrease by the same divisor, they form a geometrical series. This common multiplier or divisor is called the common ratio.

Thus,

$$a, ar, ar^2, \text{ &c. } a, \frac{a}{r}, \frac{a}{r^2}, \frac{a}{r^3}, \text{ &c. } 1, 2, 4, 8, \text{ &c.}$$

Prop. I. The product of the extremes in a geometrical series is equal to the product of any two terms, equally distant from the extremes.

Let a be the first term, y the last, r the common ratio: then the series is,

$$a, ar, ar^2, ar^3, ar^4, \text{ &c.}$$

$$y, \frac{y}{r}, \frac{y}{r^2}, \frac{y}{r^3}, \frac{y}{r^4}, \text{ &c.}$$

Each term in the upper rank is equally distant from the beginning as that below it from the end; and the product of any two such is equal to ay , the product of the first and last.

Prop. II. The sum of a geometrical series, wanting the first term, is equal to the sum of all but the last term multiplied by the common ratio.

For,

$$ar + ar^2 + ar^3, \text{ &c. } \dots + \frac{y}{r^3} + \frac{y}{r^2} + \frac{y}{r} + y$$

the series wanting the first term

$$= r \times a + ar^2, \text{ &c. } \dots + \frac{y}{r^4} + \frac{y}{r^3} + \frac{y}{r^2} + \frac{y}{r}$$

the series without the last term multiplied by r .

Cor. 1. Let s be the sum of the series

$$\overline{s-y} \times r = s - a. \text{ And } s = \frac{yr - a}{r - 1}.$$

Cor. Since the exponent of r in any term is equal to the number of terms preceding it; in the last term its exponent will be $n-1$; the last term, therefore,

$$y = ar^{n-1}, \text{ and } s = \frac{ar^n - a}{r - 1} = a \times \frac{r^n - 1}{r - 1}.$$

Hence of these four, s, a, r, n , any three being given, the fourth may be found. If n is not a small number, it will be most conveniently found by logarithms.

Cor. 3. If the series decreases, and the number of terms is unlimited, then, according to this notation, $s = \frac{yr}{r-1}$ a finite sum is the limit of the series.

Examp. Required the limit of the series $1, \frac{3}{2}, \frac{9}{4}, \frac{27}{8}, \text{ &c.}$ Hence $y=1$, and $r=\frac{3}{2}$. Therefore $s = \frac{1 \times 2}{2-1} = 2$.

Repeating and circulating decimals are geometrically decreasing series, and their limits may be found by this rule.

Thus $0.\overline{333} = \frac{3}{10} + \frac{3}{100} +, \text{ &c. } y = \frac{3}{10}$ and $r = 10$; therefore $s = \frac{yr}{r-1} = \frac{3 \times 10}{10 \times 10 - 1} = \frac{1}{3}$

III. OF INFINITE SERIES.

In many cases, if the division and evolution of compound quantities be actually performed, the quotients and roots can only be expressed by a series of terms, to be continued ad infinitum. By comparing a few of the first terms, the law of the progression of such a series will frequently be discovered. When this cannot be done, the work is much facilitated by several methods; the chief of which is that by the binomial theorem.

Theorem. Any binomial (as $a + b$) may be raised to any power (m) by the following rules.

1. From inspecting a table of the powers of a binomial obtained by multiplication, it appears that the terms without their co-efficients are a^m , $a^{m-1}b$, $a^{m-2}b^2$, $a^{m-3}b^3$, &c.

2. The co-efficients of these terms will be found by the following rule:

The co-efficient of any term multiplied into the exponent of a in it, and divided by the exponent of b increased by 1, will give the co-efficient of the next following term.

The co-efficient of the first term is always 1; and the co-efficients of the terms in order are as follows :

$$1, m, m \times \frac{m-1}{2}, m \times \frac{m-1}{2} \times \frac{m-2}{3}, \text{ &c.}$$

or more conveniently expressed thus: 1. Am,
 $b \times \frac{m-1}{2}$, c $\times \frac{m-2}{3}$, d $\times \frac{m-3}{4}$, &c. the capitals denoting the preceding co-efficient. Hence

$$\overline{a+b}^m = a^m + Ama^{m-1}b + b \times \frac{m-1}{2} \times a^{m-2}b^2 + c \times \frac{m-2}{3} a^{m-3}b^3 \text{ &c.}$$

This theorem, perhaps the most useful in the whole circle of mathematical science, may be thus demonstrated :

First, it may be expedient to premise, that if two series, as

$$A + Bx + Cx^2 + Dx^3 + \text{ &c.}$$

and $A' + B'x + C'x^2 + D'x^3 + \text{ &c.}$ be always equal, whatever be the value of x ; then the co-efficients of the corresponding series are also equal, viz.

$$A = A'; B = B' \text{ &c.}$$

For since the series are equal, whatever value be given to x , they are equal when $x = 0$; in which case there results $A = A'$; hence the remaining parts

$$Bx + Cx^2 + \text{ &c.}$$

$$\text{and } B'x + C'x^2 + \text{ &c.}$$

are equal; or dividing each by x ,

$$\text{then } B + Cx + Dx^2 + \text{ &c.}$$

$$= B' + C'x + D'x^2 + \text{ &c.};$$

and supposing again that $x = 0$, there results as before, $B = B'$; and in the same way it may be shown, that $C = C'$, $D = D'$ &c.

Let us now endeavour to find the form of the

expansion of $\overline{a+x}^m$,

or of its equal $a^m \left(1 + \frac{x}{a}\right)^m$,

m being any number whatever. Since every power or root of 1 is 1, the first term in the ex-

pansion of $\left(1 + \frac{x}{a}\right)^m$ must be 1;

whence the first term in the expansion

of $a^m \left(1 + \frac{x}{a}\right)^m$ must be a^m .

If now $m + 1$, be put for m , then

$$\text{as } \overline{a+x}^m \times \overline{a+x} = \overline{a+x}^{m+1},$$

the expansion of $\overline{a+x}^{m+1}$, will be equal to each term in the expansion

of $\overline{a+x}^m$ multiplied by $\overline{a+x}$, and

$$\text{consequently } a \cdot \overline{a+x} = a^{m+1} + a^m a,$$

will be the first term in the expansion

$$\overline{a+x}^{m+1}$$

of $\overline{a+x}^m$, and the literal part of its second term. Let the yet unknown co-efficient of this second term be represented by b , then $ba^m x$ will be the second term.

If again we put $m + 2$ for m in the original expression,

$$\text{we have } \left(a^{m+1} + ba^m x\right) \times \overline{a+x} =$$

$$a^{m+2} + b + 1 \cdot a^m x + a^m a^2 =$$

the first and second terms in the expansion of $\overline{a+x}^{m+2}$ with the literal part of its third term. In like manner by substituting

$$\overline{m+3}, \overline{m+4}, \text{ &c.}$$

successively for m , we shall have the literal parts in the expansion of

$$a^{m+n} + a^{m+n-1} x + a^{m+n-2} x^2 +$$

$a^{m+n-3} x^3$, &c. continued to $m + 1$ terms.

With respect to the co-efficient, it appears that if the co-efficient of the second term in the

expansion of $\overline{a+x}^m + 1$ will be b ,

that in the second term of the expansion of

$$\overline{a+x}^{m+2}$$

will be $b + 1$.

$$\text{But } m + 1 - b = m + 2 - b + 1,$$

or the difference between the exponent and the co-efficient of the second term, is constant in each successive expansion. But when $m = 0$, the co-efficient of the second term in the expansion

$$\overline{a+x}^m + 1$$

of $\overline{a+x}^0$ is 1; the difference between which and the exponent

is 0: hence, with respect to the second term, the difference between its co-efficient and the exponent of the expansion is always 0; or the co-efficient of the second term of the expansion is equal to the exponent.

Let now $\overline{a+x}^r$ be represented as above, viz.

$$\text{let } \overline{a+x}^r = a^r + ba^{r-1}x + ca^{r-2}x^2 + \text{ &c.}$$

where, as has been just shown, $b = r$, and $c, d, \text{ &c.}$ are to be determined. If each side of the equation be squared, we have

$$(a^r + 2ax + x^2)^r = (a^r + ba^{r-1}x + ca^{r-2}x^2 + \text{ &c.})^2$$

and substituting $(2ax + x^2)$ for x in the expansion of $\overline{a+x}^r$, we have $(a^r + 2ax + x^2)^r =$

$$a^{2r} + 2ba^{r-1}x + ba^{r-2}x^2 + 4ca^{r-3}x^3 + \text{ &c.}$$

$$4ca^{r-2}x^2 + 4da^{r-3}x^3 + \text{ &c.}$$

$$\text{But } (a^r + ba^{r-1}x + ca^{r-2}x^2 + \text{ &c.})^2 =$$

$$\left. \begin{array}{l} a^m + Ba^{m-1}x + Ca^{m-2}x^2 + Da^{m-3}x^3 + \dots \\ Ba^{m-1}x + B^2a^{m-2}x^2 + BCa^{m-3}x^3 + \dots \\ Ca^{m-2}x^2 + BCa^{m-3}x^3 + \dots \\ Da^{m-3}x^3 + \dots \end{array} \right\}$$

Now as these series are equal whatever be the value of x , the co-efficients of the like powers of x are equal, as has been shewn above.

$$\begin{aligned} \text{Hence } 2B &= 2a, \text{ or } B = a; \\ C &= \frac{B \cdot B - 1}{2}, 4C + 8D = 2D + 2BC; \text{ or,} \\ D &= \frac{C \cdot B - 2}{3} = \frac{B \cdot B - 1 \cdot B - 2}{3}, \end{aligned}$$

and the law of continuation is manifest.

$$\begin{aligned} \text{The expansion then of } \overline{a+x}^m \text{ in a series is} \\ a^m + ma^{m-1}x + m \cdot \frac{m-1}{2} a^{m-2}x^2 + \\ m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} a^{m-3}x^3 + \dots \end{aligned}$$

or a , b , c , &c. denoting the co-efficients of the preceding terms

$$\begin{aligned} \overline{a+x}^m &= a^m + Am a^{m-1}x + B \cdot \frac{m-1}{2} \times \\ &\quad a^{m-2}x^2 + C \cdot \frac{m-2}{3} a^{m-3}x^3, \dots \end{aligned}$$

where m may be any number, integral or fractional.

Examples of the application of the binomial theorem.

Example 1. Required the 7th power of $\overline{a+b}$, or the expansion of $\overline{a+b}^7$.

Here $m = 7$, and the literal parts of the term of the expansion are

$$a^m = a^7, a^{m-1}b = a^6b, a^{m-2}b^2 = a^5b^2, \dots \text{ &c. to } b^7; \text{ and the co-efficients are}$$

$$\begin{aligned} A &= 1, A \cdot m = 7, B \cdot \frac{m-1}{2} = \frac{7 \cdot 6}{2} = 21, \\ C &= \frac{m-2}{3} = \frac{21 \cdot 5}{3} = 35, \\ D &= \frac{m-3}{4} = \frac{35 \cdot 4}{4} = 35, \\ E &= \frac{m-4}{5} = \frac{35 \cdot 3}{5} = 21, \\ F &= \frac{m-5}{6} = \frac{21 \cdot 2}{6} = 7, \\ G &= \frac{m-6}{7} = \frac{7 \cdot 1}{7} = 1. \end{aligned}$$

Whence

$$\overline{a+b}^7 = a^7 + 7a^6b + 21a^5b^2 + 35a^4b^3 + 35a^3b^4 + 21a^2b^5 + 7ab^6 + b^7.$$

Example 2. Extract the cube root of 9; or exhibit in a series the expansion of $\overline{8+1}^{\frac{1}{3}}$.

$$\begin{aligned} \text{Here } m &= \frac{1}{3}, a = 8, \text{ and } x = 1; \\ C &= 8^{\frac{1}{3}} = 2, Ma^{m-1}x = 18^{\frac{1}{3}-1} \cdot 1 = \dots \end{aligned}$$

$$\begin{aligned} \frac{1}{3} \cdot 8 - \frac{3}{2} &= \frac{1}{3} \cdot 2^{-2} = \frac{1}{3 \cdot 2^2}, m \cdot \frac{m-1}{2} \times \\ a^{m-2}x^2 &= \frac{1}{3} \times -\frac{1}{3} \cdot 8 - \frac{3}{2} \cdot 1 = -\frac{1}{3 \cdot 6 \cdot 2^4}; \\ m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot a^{m-3}x^3 &= \frac{1}{3} \times -\frac{1}{3} \times \\ -\frac{1}{3} \cdot 8 - \frac{3}{2} \cdot 1 &= \frac{5}{3 \cdot 6 \cdot 9 \cdot 2^7}, \dots \end{aligned}$$

$$\text{Whence } \sqrt[3]{9} = 2 + \frac{1}{3 \cdot 2^2} - \frac{1}{3 \cdot 6 \cdot 2^4} +$$

$$\frac{5}{3 \cdot 6 \cdot 9 \cdot 2^7} - \dots$$

This theorem may be applied to quantities which consist of more than two parts, by supposing them distinguished into two, and then substituting for the powers of these compound parts their values.

$$\text{Thus, } \overline{a+b+c}^2 = \overline{a+b+c}^2.$$

ON THE METHOD OF DIFFERENCES.

This method consists in finding any term of a series, or the sum of all the terms, the successive differences of the terms being known. From the limits to which we are confined, we must, on this, and several other points of analysis, be very brief; but the following problems contain a full exposition of the principles of the method.

PROBLEM I.

To find the first term of any order of differences.

Let a, b, c, d, \dots represent the successive term of any necessary series, then the first order of differences will be

$$b - a, c - b, d - c, e - d, \dots$$

The second,

$$\begin{aligned} \overline{c-b} - \overline{b-a} &= c - 2b + a, \\ \overline{d-c} - \overline{c-b} &= d - 2c + b, \\ \overline{e-d} - \overline{d-c} &= e - 2d + c, \dots \end{aligned}$$

The third,

$$\begin{aligned} \overline{d-2c+b} - \overline{c-2b+a} &= d - 3c + 3b - a, \\ \overline{e-2d+c} - \overline{d-2c+b} &= e - 3d + 3c - b, \dots \end{aligned}$$

Hence the co-efficients of the terms composing the difference of any order, are the same as the co-efficients of the expanded binomial. The first difference of the n th order, is therefore

$$\pm a \mp nb \pm \frac{n \cdot n-1}{2} c \mp \frac{n \cdot n-1 \cdot n-2}{2 \cdot c} d \pm \dots \text{ &c.}$$

the upper signs being used when n is even, and the lower ones when n is odd.

PROBLEM II.

To find the n th term of any series, a, b, c, d, \dots from the differences.

Let the first term in each order of differences be represented by d' , d'', d''', d'''' , &c.

Then, by the last problem, we have,

$$\begin{aligned} \text{or } b - a &= d', \\ \text{or } b &= a + d'; \\ c - 2b + a &= d', \\ \text{or } c &= a + 2b + d'; \\ d - 3c + 3b - a &= d''', \\ \text{or } d &= a - 3b + 3c + d'''; \text{ &c.} \end{aligned}$$

Or, by substitution,

$$\begin{aligned} b &= a + d', \\ c &= a + 2d' + d'', \\ d &= a + 3d' + 3d'' + d''', \text{ &c.} \end{aligned}$$

Hence the co-efficients of $a, d', d'', \text{ &c.}$ in the $n+1^{\text{th}}$ term of the series, $a, b, c, d, \text{ &c.}$ are the same as the co-efficients of the expansion of $\overline{a+b^n}$; hence, the n^{th} term is

$$a + n-1 \cdot d' + \frac{n-1 \cdot n-2}{2} d'' + \frac{n-1 \cdot n-2 \cdot a-3}{2 \cdot 3} d''',$$

&c.

and the series will terminate when $d', d'' \text{ or } d''', \text{ &c.}$ becomes 0, in which case the n^{th} term will be found accurately, otherwise it can only be approximated to.

PROBLEM III.

To find the sum of n terms of any series, from the differences.

If in the series assumed in the two preceding problems, $a = 0$, then the $n+1^{\text{th}}$ term of the series will, by the last problem, be represented by

$$nd' + \frac{n \cdot n-1}{2} d'' + \frac{n \cdot n-1 \cdot n-2}{2 \cdot 3} d''' + \text{ &c.};$$

and if $b = a, c = a + \beta, d = a + \beta + \gamma, \text{ &c.}$ the $n+1^{\text{th}}$ term of $a, b, c, d, \text{ &c.}$ or the n^{th} term of $b, c, d, \text{ &c.}$ will be n terms of $a + \beta + \gamma + \text{ &c.}$ and d'' in the former series is the same as d' in this.

Hence, the sum of n terms of $a, \beta, \gamma, \delta, \text{ &c.}$ is

$$na + \frac{n \cdot n-1}{2} d' + \frac{n \cdot n-1 \cdot n-2}{2 \cdot 3} d'', \text{ &c.}$$

Before quitting this subject, we deem it proper to exhibit another method, by which an extensive and useful class of series may be summed.

$$\begin{aligned} \text{As } \frac{q}{n} - \frac{q}{n+p} &= \frac{qn + qp - qn}{n \cdot n + p} = \frac{pq}{n \cdot n + p}, \\ \text{or } \frac{q}{n \cdot n + p} &= \frac{1}{p} \left\{ \frac{q}{n} - \frac{q}{n+p} \right\}, \end{aligned}$$

it follows that if any fraction of the form $\frac{q}{n \cdot n + p}$

is equal to the p^{th} part of the difference of $\frac{q}{n}$

and $\frac{q}{n+p}$, if this difference is known, the value

of $\frac{q}{n \cdot n + p}$, then of $\frac{q}{n}$ and $\frac{q}{n+p}$ are unknown.

Hence if there be a series of fractions of the form

$\frac{q}{n \cdot n + p}$, the sum of the series will be equal to

$$\frac{1}{p} \cdot \left\{ \frac{q}{n} - \frac{q}{n+p} \right\} \frac{q}{n},$$

and $\frac{q}{n+p}$ representing two fractions having the respective forms

Example. Required the sum of n terms of the series

$$\frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 7} + \text{ &c.}$$

Here $p = 2, q = 1$, and $n = 1, 3, 5, \text{ &c.}$

$$\text{therefore, } \frac{q}{n} = 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{2n-1},$$

$$\text{and } \frac{q}{n+p} = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots + \frac{1}{2n-1} + \frac{1}{2n+1}.$$

$$\text{Hence } \frac{1}{p} \left\{ \frac{q}{n} - \frac{q}{n+p} \right\} = \frac{1}{2} \left\{ 1 - \frac{1}{2n+1} \right\} = \frac{2n}{2 \cdot 2n+1}, \text{ the required sum.}$$

On the reversion of series.

To revert a series, is to express the value of the unknown quantity in it, by means of another series, involving the powers of some other quantity. For example, if $ax + bx^2 + cx^3, \text{ &c.} = y$, then it can be found equal to a series, involving the powers of y and the given quantities, $a, b, c, \text{ &c.}$ the series involving x is said to be reverted.

To accomplish the reversion, assume

$$x = ay + by^2 + cy^3 + \text{ &c.}$$

$a, b, c, \text{ &c.}$ being indeterminate co-efficients. Substitute this series and its powers for x , and its powers in the given series, and subtract y from each side of the resulting equation, and it will then stand as under :

$$ax - a \cdot y + ab^2 + ba^2 \cdot y^2 + ac^2 + ca^2 \cdot y^3 + \text{ &c.}$$

$$\text{Hence } aA - 1 = 0,$$

$$ab^2 + ba^2 = 0,$$

$$ac^2 + ca^2 = 0, \text{ &c.}$$

and consequently,

$$A = \frac{1}{a},$$

$$B = -\frac{ba^2}{a} = -\frac{b}{a^2}$$

$$C = -\frac{2b^2 + ca^2}{a} = \frac{2b^2 - ac}{a^3}, \text{ &c.};$$

$$\text{or } x = \frac{1}{a}y - \frac{b}{a^2}y^2 + \frac{2b^2 - ac}{a^3}y^3.$$

If the series had consisted of the odd powers of x , its reverted form would have been

$$\frac{1}{a}y - \frac{b}{a^2}y^3 + \frac{3b^2 - ac}{a^5}y^5, \text{ &c.}$$

If the series are given equal to each other as $ax + bx^2 + cx^3, \text{ &c.} = ay + by^2 + cy^3, \text{ &c.}$ the value of x is obtained in terms of y in the same manner, viz. by assuming

$$x = ay + by^2 + cy^3, \text{ &c.}$$

and substituting this value in place of x ,

PART II.

OF THE GENERAL PROPERTIES AND RESOLUTION OF EQUATIONS OF ALL ORDERS.

CHAP. I.

OF THE ORIGIN AND COMPOSITION OF EQUATIONS; AND OF THE SIGNS AND CO-EFFICIENTS OF THEIR TERMS.

The higher orders of equations, and their general affections, are best investigated by considering their origin from the combination of inferior equations.

In this general method, all the terms of any equation are brought to one side, and the equation is expressed by making them equal to 0. Therefore, if a root of the equation be inserted instead of (x) the unknown quantity, the positive terms will be equal to the negative, and the whole must be equal to 0.

Def. When any equation is put into this form, the term in which (x) the unknown quantity is of the highest power is made the first; that in which the index of x is less by 1 is the second; and so on to the last, into which the unknown quantity does not enter, and which is called the Absolute term.

Prop. I. If any number of equations be multiplied together, an equation will be produced, of which the dimension is equal to the sum of the dimensions of the equations multiplied.—The term dimension, in this chapter, means either the order of an equation, or the number denoting that order, which was formerly defined to be the highest exponent of the unknown quantity in any term of the equation.

If any number of simple equations be multiplied together, as $x - a = 0$, $x - b = 0$, $x - c - d = 0$, &c. the product will be an equation of a dimension, containing as many units as there are simple equations. In like manner, if higher equations are multiplied together, as a cubic and a quadratic, one of the fifth order is produced, and so on.

Conversely. An equation of any dimension is considered as compounded either of simple equations or of others, such that the sum of their dimensions is equal to the dimension of the given one. By the resolution of equations these inferior equations are discovered, and by investigating the component simple equations, the roots of any higher equation are found.

Cor. 1. An equation admits of as many solutions, or has as many roots, as there are simple equations which compose it

Cor. 2. And conversely, no equation can have more roots than it has dimensions.

Cor. 3. Imaginary or impossible roots enter an equation by pairs; for they arise from quadratics, in which both the roots are such. And an equation of an even dimension may have all its roots, or any even number of them impossible, but an equation of an odd dimension must at least have one possible root.

Cor. 4. The roots are either positive or negative, according as the roots of the simple equations, from which they are produced, are positive or negative.

Cor. 5. When one root of an equation is discovered, one of the simple equations is found, from which the given one is compounded. The given equation, therefore, being divided by this simple equation, will give an equation of a dimension lower by 1.

Prop. II. To explain the general properties of the signs and co-efficients of the terms of an equation.

Let $x - a = 0$, $x - b = 0$, $x - c = 0$, $x - d = 0$, &c. be simple equations, of which the roots are any positive quantities $+a$, $+b$, $+c$, $+d$, &c. and let $x + m = 0$, $x + n = 0$, &c. be simple equations, of which the roots are any negative quantities $-m$, $-n$, &c. and let any number of these be multiplied together as in the following table:

$x - a = 0$		
$\times x - b$		
$= x^2 - ax$	$-bx + ab \left\{ \right.$	$= 0$, a quadratic.
$\times x - c$	$-c + ac \left\{ \right.$	
$= x^3 - ax^2$	$+ab \left \begin{array}{l} \\ \end{array} \right.$	
$-b \left\{ \right.$	$-b + bc \left \begin{array}{l} \\ \end{array} \right.$	$\times x - abc = 0$, a cubic.
$-c \left\{ \right.$	$+bc \left \begin{array}{l} \\ \end{array} \right.$	
$\times q + m = 0$		
$= x^4 - a$	$+ab \left\{ \right.$	$-abc \left\{ \right.$
$-b \left\{ \right.$	$+ac \left \begin{array}{l} \\ \end{array} \right.$	$+abm \left \begin{array}{l} \\ \end{array} \right.$
$-c \left\{ \right.$	$+bc \left \begin{array}{l} \\ \end{array} \right.$	$\times x - abcm = 0$, a bi-
$+m \left\{ \right.$	$-am \left \begin{array}{l} \\ \end{array} \right.$	quadratic.
	$-bm \left \begin{array}{l} \\ \end{array} \right.$	
	$-cm \left \begin{array}{l} \\ \end{array} \right.$	
		&c.

From this table it is plain,

1. That in a complete equation, the number of terms is always greater by unit than the dimension of the equation.

2. The co-efficient of the first term is 1.

The co-efficient of the second term is the sum of all the roots (a , b , c , m , &c.) with their signs changed.

The co-efficient of the third term is the sum of all the products, that can be made by multiplying any two of the roots together.

The co-efficient of the fourth term is the sum of all the products, which can be made by multiplying together any three of the roots with their signs changed; and so of others.

The last term is the product of all the roots, with their signs changed.

3. It appears too, that in any equation, (the terms being regularly arranged as in the preceding example,) there are as many positive roots as there are changes in the signs of the terms from $+$ to $-$, and from $-$ to $+$; and the remaining roots are negative.

Note. The impossible roots in this rule are supposed to be either positive or negative.

Cor. If a term of an equation is wanting, the positive and negative parts of its co-efficient must then be equal. If there is no absolute term, some of the roots $= 0$, and the equation may be depressed, by dividing all the terms by the lowest power of the unknown quantity in any of them. In this case also, $x + 0 = 0$, $x - 0 = 0$, &c. may be considered as so many of the component simple equations, by which the given equation

being divided, it will be depressed so many degrees.

CHAP. II.

OF THE TRANSFORMATION OF EQUATIONS.

Prop. 1. The affirmative roots of an equation become negative, and the negative become affirmative, by changing the signs of the alternate terms, beginning with the second.

Thus the roots of the equation $x^4 - x^3 - 19x^2 + 49x - 30 = 0$ are $+1, +2, +3, -5$, whereas the roots of the equation $x^4 + x^3 - 19x^2 - 49x - 30 = 0$, are $-1, -2, -3, +5$.

The reason of this is derived from the composition of the co-efficients of these terms, which consist of combinations of odd numbers of the roots, as explained in the preceding chapter.

Prop. 2. An equation may be transformed into another, that shall have its roots greater or less than the roots of the given equation, by some given difference.

Let e be the given difference; then $y = \pm e$, $x = y \mp e$; and if for x and its powers in the given equation, $y + e$ and its power be inserted, a new equation will arise, in which the unknown quantity is y , and its value will be $x \pm e$.

Let the equation proposed be $x^3 - px^2 + qx - r = 0$, of which the roots must be diminished by e . By inserting for x and its powers, $y + e$ and its powers, the equation required is,

$$\left. \begin{aligned} y^3 + 3ey^2 + 3e^2y + e^3 \\ - py^2 - 2pey - pe^2 \\ + qy +qe \\ - r \end{aligned} \right\} = 0.$$

Cor. 1. The use of this transformation is to take away the second or any other intermediate term; for, as the co-efficients of all the terms of the transformed equation, except the first, involve the powers of e , and known quantities only, by putting the co-efficient of any term equal to 0, and resolving that equation, a value of e may be determined, which being substituted, will make that term to vanish.

Thus, let the co-efficient $3e - p = 0$, and $e = \frac{1}{3}p$, which being substituted for e , the new equation will want the second term. And universally, the co-efficient of the first term of an equation of n dimensions being 1, the second term may be taken away by supposing $x = y \pm \frac{1}{n}p$.

Cor. 2. The second term may be taken away by the solution of a simple equation; the third by the solution of a quadratic and so on.

Prop. 3. An equation may be transformed into another, of which the roots shall be equal to the roots of the given equation, multiplied or divided by a given quantity.

Let $y = xe$, or $y = \frac{x}{e}$.

Then substitute for x and its powers, $\frac{y}{e}$ or ye and its powers; and the new equation will have the property required.

Cor. 1. An equation, in which the co-efficient

of the first term is any known quantity, as a may thus be transformed into another, into which the co-efficient of the first term shall be unit. Thus, let the equation be $ax^3 - px^2 + qx - r = 0$. Suppose $y = ax$ or $x = \frac{y}{a}$, and for x and its powers insert $\frac{y}{a}$ and its powers, and the equation becomes $\frac{y^3}{a^3} - \frac{py^2}{a^2} + \frac{qy}{a} - r = 0$, or $y^3 - py^2 + 2ay - a^2r = 0$.

Cor. 2. If there are fractions in an equation, they must be taken away, by multiplying the equation by the denominators, and by this proposition the equation may then be transformed into another, without fractions, in which the co-efficient of the first term is 1. In like manner may a surd co-efficient be taken away in certain cases.

Cor. 3. Hence also, if the co-efficient of the second term of a cubic equation is not divisible by 3, the fractions thence arising in the transformed equation, wanting the second term, may be taken away by the preceding corollary. But the second term may also be taken away, so that there shall be no such fractions in the transformed equa-

tion, by supposing $x = \frac{z \mp p}{3}$, $\pm p$ being the co-efficient of the second term of the given equation. And if the equation $az^3 - pz^2 + qz - r = 0$ be given, in which p is not divisible by 3, by supposing $x = \frac{z + p}{3a}$, the transformed equation reduced is $z^3 - \frac{3p^2 + 9aq}{3a} \times z - 2p^3 + 9apq - 7a^2r = 0$; wanting the second term, having 1 for the co-efficient of the first term, and the co-efficients of the other terms being all integers, the co-efficients of the given equation being all supposed integers.

General Corollary to Prop. 1, 2, 3.

If the roots of any of these transformed equations be found by any method, the roots of the original equation, from which they were derived, will easily be found from the simple equations expressing their relation. Thus, if 8 is found to be a root of the transformed equation $z^3 + 23z - 696 = 0$. Since $x = \frac{z+3}{5}$, the correspond-

ing root of the given equation $5x^3 - 6x^2 + 7x - 30 = 0$ must be $\frac{8+2}{5} = 2$. It is to be observed also, that the reasoning in Prop. 2 and 3, and the corollaries may be extended to any order of equations, though in them it is applied chiefly to cubics.

CHAP. II.

OF THE RESOLUTION OF EQUATIONS.

From the preceding principles and operations, rules may be derived for resolving equations of all orders.

I. Cardan's rule for Cubic Equations.

The second term of a cubic equation being taken away, and the co-efficient of the first term being made 1, it may be represented by $x^3 + 3qx + 2r = 0$; the sign + in all terms denoting the addition of them, with their proper signs. Let $x = m + n$, and also $mn = -q$, by the substitution of these values, an equation of the 6th order, but of the quadratic form, is deduced, which gives the value of m and n ; and hence,

$$m+n = x = \sqrt[3]{-r + \sqrt{r^2 + q^2}} - \sqrt[3]{-r - \sqrt{r^2 + q^2}}$$

Cor. 1. In the given equation, if $3q$ is negative and if r^2 is less than q^2 , this expression of the root involves impossible quantities; while at the same time, all the roots of that equation are possible. The reason is, that in this method of solution, it is necessary to suppose, that x the root may be divided into two parts, of which the product is q . But it is easy to show, that in this, which is called the irreducible case, that cannot be done.

For example, the equation $x^3 - 156x + 560 = 0$ belongs to the irreducible case, and the three roots are $+4, +10, -14$; and it is plain that none of the roots can be divided into two parts, of which the product can be equal to $\frac{156}{3}$ or 52 ; for the greatest product from the division of the greatest root -14 , is $-7 \times -7 = 49$ less than 52 .

If the cube root of the compound surd can be extracted, the possible parts balance each other, and the true root is obtained.

Cor. 2. Biquadratic equations may be reduced to cubics, and may therefore be resolved by this rule.

Some other classes of equations, too, may be

resolved by particular rules; but these and every other order of equations, are commonly resolved by the general rules, which may be equally applied to all.

II. Solutions of Equations whose Roots are Commensurate.

Rule 1. All the terms of the equation being brought to one side, find all the divisors of the absolute term, and substitute them successively in the equation for the unknown quantity. That divisor which, substituted in this manner, gives the result = 0, will be a root of the equation.

$$\left. \begin{array}{l} x^3 - 3ax^2 + 3ax^2 - 2a^2b \\ \quad - bx^2 + 3abx \end{array} \right\} = 0.$$

The simple literal divisors of $-2a^2b$ are $a, b, y, 2b$, any of which may be inserted for x . Supposing $x = a$, the equation becomes

$$\left. \begin{array}{l} a^3 - 3a^3 + 3a^3 - 2a^3b \\ \quad - ba^2 + 3a^2b \end{array} \right\} \text{ which is obviously } = 0.$$

The reason of this rule appears from the property of the absolute term being the product of all the roots.

To avoid the inconvenience of trying many divisors, this method is shortened by the following:

Rule 2. Substitute in place of the unknown quantity successively three or more terms of the progression, $1, 0, -1, \&c.$ and find all the divisors of the sums that result; then take out all the arithmetical progressions that can be found among these divisors whose common difference is 1, and the values of x will be among those terms of the progressions, which are the divisors of the result arising from the substitution of $x = 0$. When the series increases, the roots will be positive; and when it decreases, the roots will be negative.

Supposit.	Result.	Divisors.	Ar. pro.
$x = +1$	-4	1, 2, 4,	4
$x = 0$	-4	1, 2, 3, 6,	3
$x = -1$	-4	1, 2, 7, 14,	2

In this example there is only one progression, $4, 3, 2$; and therefore 3 is a root, and it is -3 , since the series decreases.

It is evident from the rules for transforming equations, that by inserting for $x, +1$, the result is the absolute term of an equation, of which the roots are less than the roots of the given equation by 1. When $x = 0$, the result is the absolute term of the given equation. When for x is inserted -1 , the result is the absolute term of an equation, whose roots exceed the roots of the given equation by 1. Hence, if the terms of the series, $1, 0, -1, -2, \&c.$ be inserted successively for x , the results will be the absolute terms of so many equations, of which the roots form an increasing arithmetical series with the difference 1. But as the commensurate roots of these equations must be among the divisors of their absolute terms, they must also be among the arithmetical progressions found by this rule. The roots of the given equation therefore are to be sought for among the terms of these progressions.

which are divisors of the result, upon the supposition of $x = 0$, because that result is its absolute term.

If from the substitution of three terms of the progression, $1, 0, -1, \&c.$ there arise a number of arithmetical series, by substituting more terms of that progression, some of these series will break off, and, of course, fewer trials will be necessary.

III. Example of Questions producing the Equations.

The sum of the squares of two numbers 208, and the sum of their cubes 2240 being given, to find them.

Let the greater be $x+y$, and the less $x-y$. Then $(x+y)^2 + (x-y)^2 = 2x^2 + 2y^2 = 208$.

$$\text{Hence } y^2 = 104 - x^2.$$

$$\text{Also } (x+y)^3 + (x-y)^3 = 2x^3 + 6xy^2 = 2240.$$

Substitute for y^3 its value and

$$2x^3 + 624x + 6x^3 = 2243.$$

This reduced gives $x^3 - 156x + 560 = 0$.

The roots of this equation are $10 + 4 = 14$.

If $x = 10$, then $y = 2$; and the numbers sought are 12 and 8, which give the only just solution.

IV. Solution of equations by approximation.

By the former rules, the roots of equations, when they are commensurate, may be obtained. These, however, more rarely occur; and when they are incommensurate we can find only an approximate value of them, but to any degree of exactness required. Of the various rules that have been given for this purpose, we select the two following as the most general and easy of application. The first is by Sir Isaac Newton, and requires the equation to be previously prepared and arranged. The second is by Dr. Hutton, and may be applied to any equation, however complicated, without any previous preparation or arrangement.

SIR ISAAC NEWTON'S METHOD.

To understand rightly the principles of this method, we deem it proper to premise the following :

Lemma. If any two numbers, being inserted for the unknown quantity in an equation, give results with opposite signs, an odd number of roots must be between these numbers.

This appears from the property of the absolute terms, and from this obvious maxim, that if a number of quantities be multiplied together, and if the signs of an odd number of them be changed, the signs of the product are changed. For, when a positive quantity is inserted for x , the result is the absolute term of an equation, whose roots are less than the roots of the given equation, by that quantity. If the result has the same sign as the given absolute term, then from the property of the absolute term either none, or an even number only, of the positive roots have had their signs changed by the transformation; but if the result has an opposite sign to that of the given absolute term, the signs of an odd number of the positive roots must have been changed. In the first case, then, the quantity substituted must have been either greater than each of an even number of the positive roots of the given equation, or less than any of them; in the second case, it must have been greater than each of an odd number of the positive roots. An odd number of the positive roots, therefore, must lie between them when they give results with opposite signs. The same observation is to be extended to the substitution of negative quantities and the negative roots.

From this lemma, by means of trials, it will not be difficult to find the nearest integer in a root of a given numeral equation.

Let the equation be $x^3 - 2x - 5 = 0$.

1. In this case a root is between 2 and 3; for these numbers being inserted for x , the one gives

VOL. I.

a positive, and the other a negative, result. Either the number above the root, or that below it, may be assumed as the first value; only it will be more convenient to take that which appears to be nearest to the root.

2. Suppose $x = 2 + f$, and substitute the value of x in the equation.

$$\begin{array}{r} x^3 = 8 + 12f + 6f^2 + f^3 \\ -2x = -4 - 2f \\ \hline -5 = -4 \\ x^3 - 2x - 5 = -1 + 10f + 6f^2 + f^3 = 0. \end{array}$$

If f is less than unit, its powers f^2 and f^3 may be neglected in this first approximation, and $10f = 1$, or $0\cdot 1$ nearly, therefore $x = 2\cdot 1$ nearly.

3. As $f = 0\cdot 1$ nearly, let $f = \cdot 1 + g$, and insert this value of f in the preceding equation.

$$\begin{array}{r} f^3 = 0\cdot 001 + 0\cdot 03g + 0\cdot 3g^2 + g^3 \\ 6f^2 = 0\cdot 06 + 12g + 6g^2 \\ 10f = 1 + 10g \\ -1 = -1 \end{array}$$

$$f^3 + 6f^2 + 10f - 1 = 0\cdot 061 + 11\cdot 23g + 6\cdot 3g^2 + g^3 = 0, \text{ and neglecting } g^2 \text{ and } g^3 \text{ as very small, } 0\cdot 61 + 11\cdot 23g = 0, \text{ or } g = \frac{-0\cdot 061}{1123} = -0\cdot 0054,$$

hence $f = \cdot 1 + g = \cdot 0946$ nearly, and $x = 2\cdot 0946$ nearly.

4. This operation may be continued to any length, as by supposing $g = -0\cdot 0054 + h$, and so on, and the value of $x = 2\cdot 09455147$ nearly.

By the first operation a nearer value of x may be found thus: since $f = \cdot 1$ nearly, and $-1 + 10f + 6f^2 + f^3 = 0$, $f = \frac{1}{10 + 6f + f^2}$, that is, $f = \frac{1}{10 + 6 + \cdot 01} = \cdot 094$ true the last figure, and $x = 2\cdot 094$.

In this manner may the root of any equation be found, after it has been cleared of radical quantities; but in the application of algebra to practical purposes, the following method of trial and error, which is applicable at once to any equation, will generally be found preferable.

DR. HUTTON'S METHOD.

Rule. Find by trial two numbers nearly equal to the root; substitute each of them in the given equation, and note the results arising from each subtraction.

Then the difference of these results is to the difference of the two assumed numbers, as the difference between the true result, and either of the former to the correction of the number which produced that result; and this result added to the number when it is too little, or subtracted from it when it is too great, will give the required root nearly.

Then this number, and any other number nearly equal to it, being substituted as before, a second correction will be obtained; and the operation may be continued till the root is obtained, to any degree of accuracy.

Example. If $\left(\frac{x^2}{5} - 15\right)^2 + x\sqrt{x} = 90$, what is the value of x ?

By a few trials it may be found that the value of x lies between 10 and 11. Let these be assumed as the values of x . Then

	1st supposition.	2d supposition.
$\left(\frac{x^2}{5} - 15\right)^2$	25	84.64
$x \sqrt{x}$	31.622	36.482

Results 56.622 121.122

Hence $121.122 - 56.622 : 11 - 10 :: 121.122 - 90 : 482$ nearly. Hence $x = 11 - 482 = 10.518$ nearly. Let then 10.5 and 10.6 be assumed for x , and we have, by proceeding as above, 83.7264 and 90.341883 for the respective results. Hence $90.341883 - 83.7264 : 10.6 - 10.5 :: 90.341883 : 90.0051679$ nearly. Whence $x = 10.6 - 0.0051679$ very nearly.

This method also applies with great facility to finding the roots of exponential equations of the form $x = a$, the only case in that class of equations in which there is any trouble in finding the root.

If $x = a$, then by the property of logarithms $s \cdot \log. x = \log. a$. Therefore find by the preceding method of trial and error, a number which multiplied by logarithms, produces the logarithm of the given quantity a , and it will be the root of the equation.

Before we dismiss this part of our subject, we shall give a concise view of the leading properties of recurring and binomial equations.

On recurring equations.

Recurring equations are those whose terms, taken in a direct order, have the same co-efficients as their respective terms taken in an inverse order.

In these equations one half of the roots are the reciprocals of the other half;

For let $x^n + px^{n-1} + qx^{n-2} \dots + x^2 + rx + 0$,

and put $x = \frac{1}{z}$; then

$$\frac{1}{y^n} + \frac{p}{y^{n-1}} + \frac{q}{y^{n-2}} \dots + \frac{q}{y^2} + \frac{r}{y} + 1 = 0;$$

or $1 + ry + qy^2 + \dots + qy^{n-2} + r^{n-1} + y^n = 0$, an equation the same as the given one, having y instead of x ; hence the value of x in an equation is equal to that of y in the other; and whatever be the value of x , the value of q is $\frac{1}{x}$ from the manner in which the second equation is generated.

A recurring equation of an odd degree has always -1 for a root, when the equal co-efficients have the same sign, and $+1$ when the equal co-efficients have different signs.

For, in the recurring equation,

$x^{2n+1} \pm px^{2n} \pm qx^{2n-1} \pm \dots - qx^2 \pm px + 1 = 0$, any co-efficient, as p of an odd power is also a co-efficient of an even power; therefore, if the corresponding co-efficients have the same sign, and -1 be put for x , the terms will destroy each other, and the equation will become equal to p ,

as it ought; and in like manner when the corresponding co-efficients have different signs, if $+1$ be put for x , the terms will destroy each other.

Hence, every binomial equation of an odd degree is advisable, either by $x + 1$ or $x - 1$; and the equation may always, therefore, be depressed to the next lower degree, or a binomial equation of an odd degree may be transformed into one of an even degree.

We shall, in the next place, shew that a recurring equation of an even degree may always be reduced to one of half that degree.

Let the equation be

$$x^{2n} + px^{2n-1} + qx^{2n-2} \dots + qx^2 + px + 1 = 0.$$

Divide by x^n , and we have $x^n +$

$$px^{n-1} + pqx^{n-2} \dots + \frac{q}{x^{n-2}} + \frac{r}{x^{n-1}} + \frac{1}{x^n} = 0.$$

$$\text{Or } x^n + \frac{1}{x^n} + p\left(x^{n-1} + \frac{1}{x^{n-1}}\right) +$$

$$q\left(x^{n-2} + \frac{1}{x^{n-2}}\right) + \&c. = 0.$$

Take n successively $= 1, 2, 3, \&c.$, and let $x + \frac{1}{x}$

$= z$, then the transformed equation become $x + \frac{1}{x}$

$$+ r = 0, \text{ or } z + r = 0, \left(x^2 + \frac{1}{x^2}\right) + (x +$$

$$\frac{1}{x}) + q + z^2 - 2 + pz + q = 0, \overline{z^3 - 3z} +$$

$z^2 - 2 + qz + r = 0, \&c.$ a recurring equation of half the degree of the given one.

On binomial equations.

Binomial equations are of the form $y^n \pm a^n = 0$, or if $ay = y$, of the form $a^n x^n \pm a^n = 0$, or $x^n \pm 1 = 0$.

The following are a few of the obvious properties of these equations.

1. If n be an even number, the roots of the equation $x^n + 1 = 0$ are all imaginary, for $\sqrt[n]{-1}$ is always imaginary when n is even.

2. If n be odd, $x^n + 1 = 0$ has only one root, for $\sqrt[n]{-1} = -1$ when n is odd

3. If n be even, $x^n - 1 = 0$ has only two real roots, and therefore $n - 1$ imaginary one; for

$$\sqrt[n]{+1} = \pm 1.$$

4. If n be odd $x^n - 1 = 0$ has only one real root, and therefore $n - 1$ imaginary one, for $\sqrt[n]{-1}$ only.

PART III.

OF THE APPLICATION OF ALGEBRA TO GEOMETRY.

CHAP. I.

A line, whether known or unknown, may be represented by a single letter: a rectangle by the

product of the two letters representing its sides : and a rectangular parallelopiped by the product of three letters : two of which represent the sides on any of its rectangular bases, and the third the altitude.

These are the most simple expressions of geometrical magnitudes; and any other, which has a known proportion to them, may in like manner be expressed algebraically. Conversely, the geometrical magnitudes, represented by such algebraical quantities, may be found; only the algebraical dimensions above the third, not having any corresponding geometrical dimensions, must be expressed by proportionals. Thus, if the algebraical equation $a^4 + b^4 = c^4 - d^4$, is to be expressed geometrically, a, b, c , and d , being supposed to represent straight lines; let $a : b : e :: f : g$, in continued proportion, then $a^4 : b^4 :: a : g$, and $a^4 : b^4 :: u : a + g$; then let $a : c : h : k : l$, and $a^4 : c^4 :: a : l$; also, let $c : d : m : n : p$, and $c^4 : d^4 :: c : p$ or $c^4 : d^4 :: c : c - p$. By combining the two former proportions, $c^4 : a^4 + b^4 :: l : a + g$, and combining the latter with this last found, $c^4 - d^4 :: b^4 :: p \times l : c \times a + g$; therefore

$$c - p \times l = c \times a + g, \text{ and } c : c - p :: l : a + g.$$

If any known line is assumed as 1, as its powers do not appear, the terms of an equation, including any of them, may be of very different dimensions; and before it can be properly expressed by geometrical magnitudes, the deficient dimensions must be supplied by powers of the 1. When an equation has been derived from geometrical relations, the line denoting 1 is known; and when an assumed equation is to be expressed by the relations of geometrical magnitudes, the 1 is to be assumed.

In this manner may any single power be expressed by a line. If it is x^r , then to 1, x find four quantities in continued proportion: so that $1 : x : m : n : p : q$, then $1 q :: 1^r$, or $q = x^r$; and so of others.

The opposite position of straight lines may be expressed by the signs $+$ and $-$.

Thus, let a point Δ be given in the line AP ,

$$P \quad M \quad A \quad M \quad P$$

any segment AP taken to the right hand being considered as a positive, a segment AP to the left is properly represented by a negative quantity. If a and b represent two lines, and if, upon the line AB from the point A , AP be taken towards the right equal to a , it may be expressed by a ; then PM taken to the left and equal to b , will be properly represented by $-b$, for AM is equal to $a - b$. If $a = b$, then M will fall upon A , and $a - b = 0$. By the same notation, if b is greater than a , M will fall to the left of A ; and in this case, if $2a = b$, and if RP be taken equal to b , then $a - b = -a$ will represent AP , which is equal to a , and situated to the left of A .

II. The Demonstration of Theorems.

All propositions in which the proportion of magnitudes only are employed, and all propositions expressing the relations of the segments of a straight line, of their squares, rectangles, cubes,

and parallelopipeds, are demonstrated algebraically with great ease.

This is particularly the case in those propositions, which may be geometrically deduced without any construction of the squares, rectangles, &c. to which they refer. From the first proposition of the second book of Euclid, the nine following may be easily derived in this manner, and they may be considered as proper examples of this most obvious application of algebra to geometry.

If certain positions are either supposed or to be inserted in a theorem, we must find, according to the preceding observations, the connection between these positions and such relations of magnitude, as can be expressed and reasoned upon by algebra. The algebraical demonstration, of the 12th and 13th propositions of the second book of Euclid, require only the 47th of the I. El. The 53d and 36th of the third book require only the 3. III. El. and 47 I. El.

From a few simple geometrical principles, a number of conclusions, with regard to figures, may be deduced by algebra; and to this in a great measure is owing the extensive use of this science in geometry. If other more remote geometrical principles are occasionally introduced, the algebraical calculations may be much abridged. The same is to be observed in the solution of problems; but such in general are less obvious, and more properly belong to the strict geometrical method.

III. Of the Solution of Problems.

Upon the same principles are geometrical problems to be resolved. The figure appropriate to the solution of the problem is supposed to be constructed, and the known and unknown quantities are denoted by appropriate symbols. Thus from the known geometrical relations between the parts known, and the one unknown, the necessary equations are formed; and by their respective resolution the problem is solved. It may first be remarked, as was done in the case of theorems, that in those problems which relate to the division of the line and the proportions of its parts, the expression of the quantities, and the stating their relations by equations, are so easy as not to require any particular directions. But when various positions of geometrical figures and their properties are introduced, the solution requires more attention and skill. No general rules can be given on this subject, but the following observations may be of use.

1. The construction of the problem being supposed, it is often farther necessary to produce some of the lines till they meet; to draw new lines joining remarkable points; to draw lines from such points perpendicular or parallel to other lines, and to perform such other operations as seem conducive to the finding of equations; and for this purpose, those specially are to be employed which divide the figure into triangles that are given, right-angled or similar.

2. It is often convenient to denote by letters, not the quantities particularly sought, but some others from which they can easily be deduced. The same may be observed of given quantities.

3. There must be as many independent equa-

tions as there are unknown quantities assumed in the investigation, and from these a final equation may be inferred by the rules of Part I.

If the final equation from the problem be resolved, the roots may often be exhibited geometrically; but the geometrical construction of problems may be effected also without resolving the equation, and even without deducing a final equation.

If the final equation is simple or quadratic, the roots being obtained by the common rules may be geometrically exhibited by the finding of proportionals, and the addition or subtraction of squares.

By inserting numbers for the known quantities, a numeral expression of the quantities sought will be obtained by resolving the equation. But in order to determine some particulars of the problem, besides finding the unknown quantities of the equation, it may be farther necessary to make a simple construction; or, if it is required that every thing be expressed in numbers, to substitute a new calculation in place of that construction.

PROBLEM I.

To divide a given straight line AB into two parts, so that the rectangle contained by the whole line, and one of the parts may be equal to the square of the other part.

$$\overline{c \ A \ C \ B}$$

Let c be the point of division, and let $AB = a$, $AC = x$, and then $CB = a - x$. From the problem $a^2 - ax = x^2$; and this equation being resolved, gives $x = \pm \sqrt{a^2 - \frac{a^2}{4}}$.

$$\sqrt{a^2 + \frac{a^2}{4}} - \frac{a}{2}.$$

The quantity $\sqrt{a^2 + \frac{a^2}{4}}$ is the hypotenuse of a right angled triangle, of which the two sides are a and $\frac{a}{2}$, and is therefore easily found $\frac{a}{2}$ being taken from this line, gives $x = AC$, which is the proper solution. But if a line AC be taken on the opposite side of A , and equal to the above-mentioned hypotenuse, together with $\frac{a}{2}$ it will

represent the negative root $\sqrt{a^2 + \frac{a^2}{4}} - \frac{a}{2}$, and

will give another solution; for in this case also $AB \times BC = AC^2$. But c is without the line AB ; and therefore, if it is not considered as making a division of AB , this negative root is rejected.

PROBLEM II.

In a given triangle ABC to inscribe a square.

Suppose it be done, and let it be $EFHG$. From let AD be perpendicular on the base BC , meeting EF in K .

Let $BC = a$, and $AD = p$, both of which are given because the triangle is given. Let AK be assumed as the unknown quantity, because from it the square can easily be constructed; and let it be called x .

Then $(KD = EG =) EF = p - x$.

On account of the parallels EF , BC , $AD : BC :: AK : EF$; that is $p : a :: x : p - x$, and $p^2 - px = ax$, which equation being resolved gives $x = \frac{p^2 - ax}{p + a}$.

Therefore x or AK is a third proportional to $p + a$ and p , and the point K being found, the construction of the square is sufficiently obvious.

PROBLEM III.

To describe a circle through two given points A, B , that shall touch a line CD given in position.

Join at n , and through o , the assumed centre of the required circle, draw re perpendicular to AB , which it will bisect in e . Join OB , and draw eh, og perpendicular to cd ; og will fall on the point of contact o .

Now, as A, E, B, n , and r are given points, put $EB = a$, $EF = b$, $EH = c$, and FO , the required radius $= x$.

Then $OF = b - x$, and because OEB is a right-angled triangle $AB^2 = EO^2 + EB^2$, or $OB^2 = x^2 + a^2$; and by similar triangles $FE : EH :: FO : EC$; or OB ; or $b : c :: b - x : OB = \frac{c}{b} \times bx$. Hence if these two values of OB be equated,

$$b^2 - c^2 \cdot x^2 + 2bc^2x = b^2(c^2 - a^2),$$

$$\text{or } x^2 + \frac{2bc^2}{b^2 - c^2}x = \frac{b^2(c^2 - a^2)}{b^2 - c^2},$$

a quadratic equation, which, resolved the usual way, gives

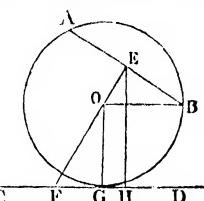

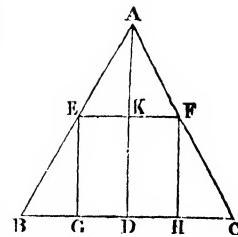

$$b\sqrt{c^4 + \frac{c^2 - a^2 \cdot b^2 - c^2 - bc^2}{b^2 - c^2}}$$

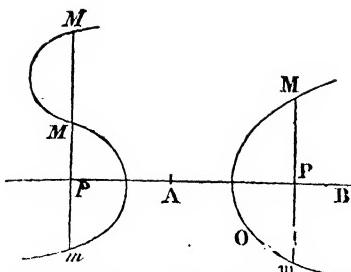

CHAP. II.

OF THE DEFINITION OF LINES BY EQUATIONS.

1. When curve lines are considered algebraically, they are supposed to be produced by the extremity of one straight line, as PM moving in a given position, which is called the base.

2. The straight line PM , moving along the other, is called an inordinate, and is usually denoted by y .

3. The segment of the base AP between a given point in A , and an ordinate PM , is called an absciss, with respect to that ordinate, and is denoted by x . The ordinate and absciss together are called co-ordinates.

4. If the relation of the variable absciss and ordinate AP and PM be expressed by an equation, which besides x and y contains only known quantities, the curve MO , described by the motion of the ordinate, is called the locus of that equation.

5. If the equation is finite, the curve is called algebraical. N. B. The terms geometrical and algebraical, as applied to curve lines, are used in different senses by different writers; there are several other classes of curves, besides what are here called algebraical, which can be treated of mathematically, and even by means of algebra.

6. The dimensions of such equations are estimated from the highest sum of the exponents of x and y in any term. Thus the terms $x^4, x^3y, x^2y^2, xy^3, y^4$, are all of the same dimensions.

7. Curve lines are divided into orders, from the dimensions of their equations, when freed from fractions and surds.

I. The determination of the figure of a curve from its equation.

The general figure of the curve may be found by substituting successively particular values of x the absciss, and finding, by the resolution of these equations, the corresponding values of y the ordinate, and of consequence to so many points of the curve.

1. If in any case a value of y vanishes, then the curve meets the base in a point determined by the corresponding value of x . Hence by putting $y = 0$, the roots of the equation, which in that situation are values of x , will give the distances on the base from the point assumed as the beginning of x , at which the curve meets it.

2. If at a particular value of x , y becomes infinite, the curve has an infinite arc, and the ordinate at that point becomes an asymptote.

3. If when x becomes infinite, y vanishes, the base is an asymptote.

4. If any values of y become impossible, then so many intersections of the ordinate and curve vanish. If at any value of x , all the values of y become impossible, the ordinate does not there meet the curve.

5. If two values of y become equal, and have the same sign, the ordinate in that situation either touches the curve, or passes through an intersection of two of its branches, which is called a punctum duplex, or through an oval become infinitely little, called a punctum conjugatum.

In like manner is a punctum triplex, &c. to be determined.

$$\text{Let the equation be } ay^2 - xy^2 = x^3 + bx^2 \\ \text{Therefore, } y^2 = \frac{x^3 + bx^2}{a - x} \text{ and } y = \pm \sqrt{\frac{x^3 + bx^2}{a - x}} \\ = \pm \sqrt{\frac{x + b}{a - x}} + x.$$

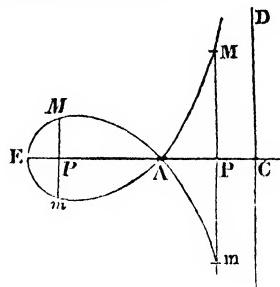

Let AB be assumed as a base on which the absciss are to be taken from A , and the ordinates perpendicular to it.

Since the two values of y are equal, but have opposite signs; PM and pm , which represent them, must be taken equal to each other on opposite sides of AB ; and it is plain that the parts of the curve on the two sides of AB must be every way similar and equal.

$$\text{If } x \text{ is made equal to } a, y = x\sqrt{\frac{x + b}{a - x}},$$

which is an algebraical expression for infinity, therefore if AC is taken equal to a , the perpendicular cd will become an asymptote to the curve, which will have two infinite arcs. If x is greater than a , the quantity under the radical sign becomes negative, and the values of y are impossible; that is, no part of the curve lies beyond cd .

Both branches of the curve pass through A , since $y = 0$, when $x = 0$. Let x be negative, and $= \pm x\sqrt{\frac{b - x}{a + x}}$; the values of y will be possible, if x is not greater than b ; but if $x = b$, then $y = 0$, and if x is greater than b ; the values of y become impossible; that is, if the absciss AP be taken to the left of A , and less than b , there will be two real equal values of y , PM , pm on the opposite sides as before; if AE be taken equal to b , the curve will pass through E , and no part of it is beyond E .

The portion between A and E is called a nodus.

If y be put $= 0$, then the values of x are $0, 0 - b$; that is, the curve passes twice through A , or A is a punctum duplex, and it passes also through E as before.

By the same methods, the locus of any other equation is to be traced: thus, by varying the former equation, the figure of its locus will be varied. If $b = 0$, then the points A and E coincide, the nodus vanishes, and A is called a cusp.

If b is negative, then E is to the right of A , which will now be a punctum conjugatum. The rest of the curve will be between E and C , and cd becomes an asymptote.

II. General properties of curves from their equations.

A straight line may meet a curve in as many points as there are units in the dimensions of its equation; for so many roots may that equation have. An asymptote may cut a curve line in as many points, excepting two, as it has dimensions, and no more. The same may be observed of the tangent.

Impossible roots enter an equation by pairs; therefore the intersection of the ordinate and curve must vanish by pairs.

The curves, of which the number expressing the order is odd, must have at least two infinite arcs; for the absciss may be so assumed, that for every value of it, either positive or negative, there must be at least one value of y , &c.

Scholium.

If the relation between the ordinate and absciss be fixed, but not expressible by a finite equation, the curve is called mechanical or transcendental. This class is also sometimes defined by equations, by supposing either x or y in a finite equation to be a curve line, of which the relation to a straight line cannot be expressed in finite terms.

If the variable qualities x or y enter the exponents of any term of an equation, the locus of that equation is called an exponential curve.

We shall now conclude this article with two or three problems to show the application of algebra to the different departments of science.

PROB. I. A pendulum vibrates as often in a minute as it is inches long. What is its length?

Let the required length be represented by x ; then the length of the seconds pendulum being $39\frac{1}{2}$, and the number of vibrations made in a given time being inversely as the square roots of the lengths, we have

$$\sqrt{x} : \sqrt{39\frac{1}{2}} :: 60 : x, \text{ or } x\sqrt{x} = 60\sqrt{39\frac{1}{2}}, \text{ or } x^2 = 140850; \text{ whence } x = \sqrt{140850} = 52.0282.$$

PROB. II. Suppose a wheel a turns another wheel b , on whose axis is another wheel c which turns a wheel d . It is required to find the least number of teeth in each of these four wheels, so that the wheels a and d may make equal revolutions; the wheel b being supposed to roll round the wheel c in 365 turns of the wheel a !

Let a , b , c , d , represent the four wheels, the letters denoting also the number of teeth in the wheels. Then $\frac{b}{c}$ are the turns b or c has for

one of a , and $\frac{d}{c}$ the turns

d has for one of c ; consequently $\frac{bd}{ac}$ are the turns

d makes for one of a , which would be 1, if the wheel d were stationary, because a and d are to revolve in equal times. But

$\frac{d}{c}$ are the turns which d gains or loses in 365 turns of the wheel a , according as it is carried,

the contrary or the same way as the motion of the wheel c , and $365 : \frac{c}{d} :: 1 : \frac{c}{365d}$, the part of a turn which d gains or loses in one turn of a . Hence we have this equation

$$\frac{ac}{bd} \pm \frac{c}{365d} = 1, \text{ or } \frac{d}{c} \pm \frac{1}{365}.$$

Here 365 is divisible into two fractions, 73 and 5, take $c = 73$, and, and multiply the equation by 5, and it becomes $\frac{5a}{b} = \frac{5d \pm 1}{73}$.

To find the least value of d which will make $\frac{5d + 1}{73}$ an integer, multiply it by 29, and it becomes $\frac{165d \pm 29}{73}$ which must also be a whole number,

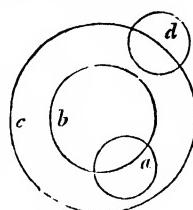

$$\text{and consequently: } \frac{146d}{73} - \frac{145d + 29}{73} = \frac{d - 29}{73}$$

must be a whole number. Let n be that number, then $d = 73n \pm 29$. If d roll round c the same way that c revolves, the lower sign is used; but if the contrary way, the upper sign.

It is evident that the least value of d will be obtained by taking $n = c$, when $d = 29$, $5a \div b = 2$, or $a : b :: 2 : 5$, the ratio of a to b ; whence $a = 10$, $b = 25$, $c = 73$, and $d = 29$. If the upper sign be used, the least value of d will be obtained by taking $a = 1$, in which case $a = 15$, $b = 23$, $c = 73$, and $d = 46$.

PROB. How high in a given latitude is it possible to erect a building?

When the centrifugal force arising from the earth's rotation exceeds the force of gravity at the same point, a body situated in that place would be thrown off from the earth; hence the height of the point at which the focus of gravity and centrifugal force are equal, will be the answer to this question. Now the centrifugal force at the surface of the earth at the equator is known to be $\frac{1}{20}$ th part of the force of gravity, and the force of gravity is inversely as the square of the distance from the centre, and the centrifugal force directly as the distance from the axis of rotation. In the annexed figure let AB represent the building, N the north, and S the south pole; E and Q the points where the meridian cuts the equator, BF and AD perpendiculars on EQ and NS . Put $AB = x$, $CA = r$, and $AD = c$; then $BC = r + x$, and $CA : AD :: CB : CF$; or $r : c : r + x = c : r + x : r = c : CF$. Now if s be considered as the centrifugal force at Q or A , then $CQ : CF :: 1 : r + x \cdot c \div r^2$, the centrifugal force at F or B in the direction CF ; and $CB : CF :: r + x \cdot c \div r^2 : r + x \cdot c^2 \div r$, the centrifugal force at B in the direction CB . And $CB^2 : CA^2 :: 289 : 289 \cdot r^2 \div r + x^2$, the force of gravity at B . Hence $r + x \cdot c^2 \div r = 289r^2 \div r + x^2$, or $r + x^2 = 289r^2 \div c^2$, whence $x = r(\sqrt{289 \div c^2} - 1)$. If the latitude be 55° , and the radius of the earth $= 3970$ miles, then &c.

ALGEDO, in surgery, from *αλυγός*, the running of a gonorrhœa stopping suddenly after it appears. When it thus stops, a pain reaches to the anus, or to the testes, without their being swelled; and sometimes to the bladder; in which case, there is an urging to discharge the urine, which is with difficulty passed; calomel repeated so as to purge, brings back the running, and then all difficulty from this symptom ceases.

ALGEMA, *ἀλγημα*, in medicine, the disease whence the pain proceeds, in which sense the term is frequently used by Hippocrates.

ALGEMISI, or **ALGEMESEN**, a small town, of Spain, six leagues south of Valencia, and five leagues north-north-west of Gandia. It is situated not far from the river Xucar, near which, grow great quantities of the pita, (as it is called) or American aloes, Agave, of which the people make cordage, and the Catalans spin it to a sufficient fineness for making lace.

ALGENEB, or **ALGENIB**, in astronomy, the name of two fixed stars of the second magnitude; one marked γ in the wing of Pegasus, the other α on the right side of Perseus.

ALGERINES, the inhabitants of Algiers. See **ALGIERS**.

ALGEZIRA, or **ALGEZIRAS**, an ancient maritime town of Andalusia, in Spain, which has a sea-port, on the coast of the Straits of Gibraltar. The harbour is formed by two islands, which gave rise to the name Algezira, signifying in the Arabic tongue, an island. It was formerly called Old Gibraltar, and lies seven miles west from the town of that name. By this city the Moors entered Spain in 713; and it was not recovered from them till 1344, after a very long siege, remarkable for being the first in which cannon

were made use of. Algezira is agreeably situated close by the sea side, on a gentle slope, not far from Jarifa. It formerly consisted of two towns of considerable importance, but is now falling into decay. An aqueduct of hewn stone, three-fourths of a mile in length, supplies the city with fresh water. It was near this place that Sir James Saumarez, obtained a victory over the French and Spanish fleet, on the 11th of July, 1801.

ALGEZUR, a small town of Portugal, in Algarva, whose old castle makes a part in the royal arms of Portugal.

ALGIER, or **ALGERI**, a town in Sardinia, and a bishop's see, upon the north-west coast of the island, between Sasserì and Bossa, seventy-nine miles north-west of Cagliari. Though not large, it is well peopled, and has a commodious port. The coral obtained on this coast is in the highest esteem of any in the Mediterranean.

ALGIABARII, a Mahomedan sect of predesertinarians, who attribute all the actions of men, good or evil, to the agency or influence of God. The Algiabarii stand opposed to the Alkadarii. The justice of God in punishing the evil he has caused, they resolve wholly into his absolute dominion over his creatures.

ALGIDUM, from *gelidus*, cold or freezing, in ancient geography, a town of Latium, supposed to be so called on account of the cold. It belonged to the *Aequi*, and was situated between Prænesté and Alba. On the top of a high mountain of the same name, was situated a celebrated temple of Diana.

ALGITEN, a small town of Lombardy, ten miles north of Milan, and situated on the Lambro.

A L G I E R S.

' **ALGIERS**, a kingdom of Africa, now one of the states of Barbary. According to the latest and best computations, it extends 460 miles in length, from east to west, along the Barbary coast, but is very unequal in breadth, some places being scarce forty miles broad, and others upwards of one hundred. It lies between long. $0^{\circ}. 16'.$ and $9^{\circ}. 16'$. west, and extends from lat. $36^{\circ}. 55'.$ to $44^{\circ}. 50'.$ north. It is bounded on the north by the Mediterranean; on the east by the river Zaine, the ancient Tusca, which divides it from Tunis; on the west by the Milwoia, and the mountains of Trava, which separate it from Morocco and Taflet; and on the south by mount Atlas, and the Zaara, or Numidian desert.

DIVISIONS.—This country comprehends the greater part of the Numidia and Mauritania Cæsariensis of the ancients; so called from the city of Casarea, built here by Juba the younger. The present name is derived from the situation of the metropolis, called by the Turks Algezair, Aljezier in Arabic, Al-jezirah, *the island*, alluding to an island which was anciently opposite the city, but is now joined to it by a pier. The modern divisions are Tlemsan or Tremecen, Mascara,

Titterie, Algiers Proper and Constantia; although Dr. Shaw makes a different arrangement, and unites the provinces of Algiers Proper and Titterie into one district.

Of the above divisions Constantia is the most important, lying along the eastern confines, and once in the possession of Tunis. Of the chief towns of this district, Constantia contains population of at least 100,000; Bona is strongly fortified, and has an excellent harbour; Bujeya has a larger port than Algiers, though not so safe for shipping; Gigeri, Zamoura, Tebef, Necanz, and Stessa are all places of considerable eminence. Cuco and Biscari are regions tributary to this province; but can scarcely be said to have any settled administration of government; and in this respect correspond with Labez, a barren rocky region, frequently described as a portion of this province. Algiers Proper contains the capital. Titterie, extending towards the south presents a surface irregularly broken with mountains, although some fertile plains are stretched around in different directions; and the towns of Bleeda and Medea contribute much to its improvement. I: Mascara or Tlemsan, the western district, are the towns of Tlemsan, Mascara,

Oran, Tannis, Mustygannim, Sher-shell, and the port of Mars-al-Quibber; of which Oran, originally fortified by the Spaniards, and Sher-shell, containing monuments and antique remains, are the most important.

RIVERS.—The chief rivers are the Milwooria, anciently called Malva, the Yesser or Ziz, which divides the province of Mascara; the Zelifor Shellif; the Mina, the Chylematis of Ptolemy; the Belef, the Carthema of the ancients; the Hued-al-quiver or Zinganir, supposed to be the ancient Nalabata or Nasaba, and the Suf-Gemar, the Ampsaga of Ptolemy; the Haregol, probably the Signa of Ptolemy, flowing from the Great Atlas, through the desert of Anguid, till it falls into the Mediterranean Sea near Oran.

MOUNTAINS. The chief mountains are the Atlas, various branches of which stretch into these provinces from the southern regions, under the names of Lowat and Ainnier; the mountains of Trara and Jurjura, extending from the interior toward Algiers; those of Felizia, Gibbell Auress, Anwell, the Mons Auracia of the ancients. Generally speaking, the Great Atlas bounds the states from east to west, and the mountains of Trara from the west towards the kingdom of Morocco.

CLIMATE, SOIL, &c.—The climate of Algiers, except when the hot and violent winds blow from the Great Desert, is in most places so moderate, that they enjoy a constant verdure; the leaves of the trees being neither parched up by heat in summer, nor nipped by the winter's cold. They begin to bud in February; in April the fruit appears in its full bigness, and is commonly ripe in May. The melons have an exquisite taste, and the stems of the vines are so large, that a man can hardly grasp them with his arms; and the bunches of grapes are 1½ feet long. Scarcely a cloud blots the sky in the summer months; and in September and October the rains begin to fall, wheat and beans are then sown; the latter rains fall in April, to which succeeds the harvest in May or June. In dressing their corn the Algerines still retain two remarkable customs of the east, viz. treading out the corn by means of horses or cattle; and throwing it up with a shovel or fan against the wind to winnow it. The soil of Algiers is excessively various; some places being very fertile in corn, fruits, &c. and others extremely hot, dry, and barren, on which account they are generally suffered to lie uncultivated by the inhabitants, who are very negligent. These barren places, especially such as lie on the southern side, and are at a great distance from the sea, harbour vast numbers of wild creatures, as lions, tigers, buffaloes, wild boars, stags, porcupines, monkeys, ostriches, &c.

ANIMALS.—The horses of this country are very superior, though the breeding of them is not attended to as it is in Arabia. They are extremely active, full of fire, command an interesting appearance, and are exercised to gallop with the reins thrown upon the neck; and so expert are the riders, that they can stop them at full speed. African horses are seldom seen in any other pace than a gallop; and are, from their impetuosity, admirably adapted for cavalry charges. The kumrah, a breed from the ass and the cow; the ass; the mule; the dromedary and camel, are the beasts of

burden. The tame cattle are black and slender, but numerous herds run wild in the southern and eastern parts of the country, distinguished by the inflexion of their horns. Of sheep there are two species: that near the desert has an excellent appearance, and reaches almost to the height of a Shetland pony; but is not remarkable for either its flesh or its wool. A peculiar species of the goat is found in the hilly regions, with tufts of hair on the knee and neck joints. Of wild animals, besides those already mentioned, are leopards, hyenas, panthers, wolves, and a species of the jackal, which pours down into the villages in terrific flocks, and is so furious as to tear up the dead bodies out of the graves.

BIRDS.—Of birds they have a great variety. Quails are seen at the fall of the year crossing the Mediterranean in large flocks like clouds. Starlings, storks, pigeons, and most of the domestic fowls and common birds of Europe are in great plenty. There is a red lark not seen in Italy, which frequently excites the attention of travellers. Of those birds which are less common, may be enumerated, the karabur, or ash-coloured falcon; the saharag, a species of magpie; the graab, or large crow of the desert, with legs and beak red like the falcon; the houbarry, whose gall is said to be medicinal; and the capsia, a large sparrow with a shining breast and ruddy coat like the lark, who, in melody, is said far to surpass the European nightingale. Ostriches mostly inhabit the desert of Anguid, where they are seen in large flocks, and appear at a distance like troops of robbers. They shed their feathers in the winter, which are collected by the natives to supply the European markets. Assisted by the wind, this bird is capable of outrunning the fleetest horse; but if driven against the wind, is easily taken, the flapping of her wings meeting with less resistance from the surrounding air.

REPTILES AND INSECTS.—The scorpion is, amongst reptiles, the most formidable of those that are common to this region. It is of different colours, and inflicts a virulent wound, of which, though not perhaps in itself dangerous, many persons die annually. Vipers and numerous other serpents are common, and the great boa constrictor lies in the southern provinces. The locusts are a most dreadful scourge to this, and to contiguous kingdoms, from which neither fires, nor trenches, nor all the art and ingenuity of man have, as yet, been able to deliver them. In the months of April and May, these insect armies appear from the south, and spreading themselves over the valleys, begin to deposit their eggs. The young ones appear in June, and ascend in such vast multitudes, as to cover many acres of ground to the depth of several inches. Moving slowly on in quest of food, they destroy every vestige of vegetation, and leave nothing behind them but misery and distress. For the curious natural history of this insect, see the article. They have also a terrible kind of fly, which is poisonous to cattle, and particularly tormenting to the horse. A swarm of these insects settling upon a horse, have been known to sting him till he falls through loss of blood.

ANTIQUITIES.—The antiquities of this king-

dom are considerable, enriched with ruins, which have hitherto delighted and astonished the world. The mountains of Aures, to the south of Constantina, are a knot of eminences running over one another, with several plains and valleys between them. They are considered the garden of the kingdom, and present a circuit of 130 miles, covered with numerous ruins, of which those of L'Erba, called by the ancients Lambese, are the most remarkable. The magnificent remains of several city gates break upon the sight of the traveller on his approach to this interesting spot. These were four in number, according to the Arabs, from each of which, in case of emergency, the city could rout 40,000 armed men. The frontispiece of a beautiful temple of the Ionic order, and the remains of an amphitheatre, including the seats and upper part almost entire. An elegant mausoleum, erected in the form of a dome, supported by Corinthian columns, with a supposed triumphal arch, and several other eminent antiquities, throw a light on the former magnificence of this ancient city. At Mednascham is a fabric supposed to be the tomb of Syphax and the Numidian princes. Constantina, the ancient Cirta, capital of Numidia, forms one of the most interesting parts of the kingdom; and though of inferior extent to the former city, is perhaps second only to Algiers. For a detail, see CONSTANTINA. Some remains of Sigma, at Nedroina, in Constantina province, and of the Pontus Divini of Strabo, are still standing; and at Shershel are the supposed remains of Julia Casarea, consisting of wide cisterns, mosaics, broken columns, and curious sites of buildings, amongst which are found numerous medals and other monuments of antiquity.

The city of Algiers, opposite Minorca, and 300 miles west of Tunis, is supposed to be the ancient Iconium, and forms the present capital of the kingdom. It rises, from the activity of a hill, in the imposing form of an amphitheatre, and is a mile and half in circuit, containing nearly 30,000 inhabitants. Its antiquities are not very important, and of modern buildings the dey's palace, and the seraglio of his favourite wife are the largest, and are adorned with marble pillars of curious workmanship. There are ten large mosques and fifty of inferior dimensions; the finest of these erections is sixty feet in length, by forty in width, three stories in height, and supported by beautiful pillars. The walls are composed of white stone from the ruins of Ouran, the columns of white marble imported from Genoa. From the scarcity of water in the city, magnificent aqueducts have been erected, which convey water from no fewer than 150 fountains, communicating pipes branching out in all directions towards the different houses. The town consists, for the most part, of one principal street, in the direction of east and west, intersected by a few others of inferior importance. The streets generally are extremely irregular and inconvenient. So narrow are they that two persons can scarcely pass abreast; and when a camel passes, one must stand up close to the wall to avoid being crushed by him. The houses which communicate with each other are flat roofed and lofty, forming a promenade from one end of the town to the other. The inhabitants visit on the

top, and spend their evenings in each other's society. The common buildings are of brick and stone, with four chimneys rising in the four corners of the terrace, and those of the more opulent class are adorned with marble columns and ceilings of superior workmanship. The baths and mosques are numerous, and of the former some are set apart for the use of females. Within the city are numerous sepulchres and chapels dedicated to marabouts or reputed saints, which the women yet visit every Friday. The barracks for the Turkish soldiery are spacious and handsome. In the middle of the last century this town was surrounded with a high wall, twelve feet thick, flanked with square towers and a deep ditch. These works have, however, been suffered to decay, a naval rather than a military defence, being the chief dependence of the Algerines. The mole of the harbour forms a spacious semicircle, a basin 130 fathoms long and eighty wide, affording shelter and protection for ships of the largest burden. It is surrounded by a light-house, and overlooked by a castle, founded on the solid rock. Powerful batteries protect the entrance of the harbour; and along the coast are numerous other batteries, which, since the British expedition, have been put in a better posture of defence. The inhabitants are chiefly Mahomedans, Jews, and Christians. The Turkish soldiers are great tyrants; for they will go to the farm houses in the country for twenty days together, living at free quarters, and making use of every thing, not excepting the women. The Algerines eat, as in Turkey, sitting cross-legged round a table about four inches high, and using neither knives nor forks; before they begin, every one says, 'Be isme Allah,' 'In the name of God.' When they have done, a slave pours water on all their hands as they sit, and then they wash their mouths. Their drink is water, sherbet, and coffee. Wine, though prohibited by Mahomet, is drank immoderately by some. Algiers, though for several ages it has braved some of the greatest powers of Christendom, could make but a faint defence against a regular siege; and it is said that three English fifty gun ships might batter it about the ears of its inhabitants from the harbour. The Spaniards attacked it in the year 1775, both by land and sea, but were repulsed with great loss, though they had near 20,000 foot, 2000 horse, and 47 royal ships of different rates, and 346 transports. In 1783 and 1784, they also renewed their attacks by sea to destroy the city and galleys; but were at length forced to retire without effecting its capture.

The manufactures, consisting chiefly of sashes, handkerchiefs, and carpets, are inferior to those of Turkey. The trade, till within the last twenty years, was entirely in the hands of the French, who kept establishments at Bona, La Cala, and II Col, partly with a view to the coral fisheries in these quarters. In consequence of the revolution, however, France lost this branch of her commerce; and Great Britain, in 1806, stipulated with the Dey of Algiers for the possession of the three ports above named. The sum of 50,000 dollars has been regularly paid for them, although little advantage has been, at present, derived. From its situation, it affords an excellent medium

for conveying British goods into the interior of Africa. It is said that the corsairs or pirates of Algiers form a small republic, of which the rais or captain is the supreme bashaw; who, with the officers under him, form a kind of douwan, in which every matter relating to the vessel is decided. These corsairs are chiefly instrumental in importing whatever commodities are brought into the kingdom by way of merchandise or prizes, as gold and silver stuffs, damasks, cloths, spices, tin, iron, plated brass, lead, quicksilver, cordage, sail-cloth, bullets, cochineal, linen, tartar, alum, rice, sugar, soap, cotton, copperas, aloes, Brazil wood, logwood, vermillion. Few commodities, at present, are exported from Algiers. Ostrich feathers, copper, rugs, silk sashes, embroidered handkerchiefs, dates, &c. are the most remarkable.

The inland inhabitants, distinguished by the name of Berebers, are the proper natives of the country, supposed to have been descended from the ancient Sabeans, who plundered the patriarch Job; and still retaining their original character of robbers and pirates, removed from Arabia Felix and settled at Algiers.

Others believe them to be descended from the Canaanites, who were driven out of Palestine by Joshua. They are dispersed all over Barbary, and divided into a multitude of tribes under their respective chiefs: most of them inhabit the mountainous parts; some range from place to place and live in tents or portable huts; others in scattered villages: in which situation they have generally kept from intermixing with other nations. The Berebers are reckoned the richest of all the Algerines, go better clothed, and carry on a much larger traffic in cattle, hides, wax, honey, iron, and other commodities. They have also some artificers in iron, and some manufacturers in the weaving branch.—The name, Bereber, is supposed to have been originally given them on account of their being first settled in some desert place. Upon their increasing in process of time they divided themselves into five tribes, probably on account of religious differences, called Zinhagians, Muscamedins, Zeneti, Hoares, and Gomeres; and these having produced 600 families, subdivided themselves into a great number of petty tribes.—To these we may add the Zwowahs, by European authors called Azuagues, or Assagues, who are likewise dispersed over the greater part of Barbary and Numidia. Great numbers of these inhabit the mountainous parts of Cuco, Labez, &c. leading a wandering pastoral life. But the most numerous inhabitants have long been Moors and Arabians. The former are very stout and warlike, and skilful horsemen; but so addicted to robbing, that one cannot safely travel along the country at a distance from the towns without a guard, or at least a marabout or saint for a safeguard. The inhabitants, in general, have a pretty fair complexion; they are robust and well proportioned. People of distinction wear their beards; they have rich clothes made of silk, embroidered with flowers of gold, and turbans enriched with jewels. The Turks, who compose the military force, have great privileges, pay no taxes, are never publicly punished, and rarely in private. The lowest soldier domineers

over the most distinguished Moors at pleasure. If he finds them better mounted than himself, he exchanges horses without ceremony. The Turks alone have the privilege of carrying fire-arms. Some good qualities, however, distinguish them, in spite of this excess of despotism. They never game for money, nor even for trifles; and they never profane the name of the deity. They soon forget their private quarrels; and, after the first paroxysm of resentment is over, it is infamy for a Turk to keep in remembrance the injuries he has received. In this respect certainly they are less barbarous than some other nations that boast of their civilization.

The government of Algiers, although it has been styled a republic, is neither republican nor despotic, but a sort of oligarchy, or at least approximating to that model. According to some writers it is difficult to ascertain what it is, whether a vile oligarchy, an aristocratical commonwealth, or a lax, tumultuous, ill-regulated despotism. Almost every day that succeeds to the throne, paves the way by the murder of both his predecessor and rival competitors, and is himself at last strangled or otherwise despatched at the pleasure of a more powerful rival. To the imperfection of its government, may be in a great measure attributed the many miseries of this unhappy kingdom.

The population consists chiefly of Moors and Turks, who though not more than 7000 in number, keep the government in their own hands exclusively. The most enlightened of the people are the Cologlis, or the children of the Turks by the Moorish women. The Moors are divided into two kinds, the Kabylas or mountain tribes, and the Berebers, the mechanics of the country. The Arabian tribes keep themselves totally distinct and are employed in commerce.

The cadi is the ecclesiastical judge, besides whom there is a superior religious officer, called mufti or high-priest; and an inferior one called the grand marabout. To these officers lies the supreme appeal in all religious concerns. The people are generally ignorant; yet so jealous are the higher ranks of their authority, that printing, according to M. Pantani, has been prohibited, lest there should be too much knowledge in the nation. The only instruction consists in teaching boys to read and repeat fifty or sixty aphorisms from the Koran. The Alfagni or learned men are jugglers.

The Algerine kingdom made formerly a considerable part of the Mauritania Tingitana, See MAURITANIA, which was reduced to a Roman province by Julius Caesar, and from him also called Mauritania Cæsariensis. After the Romans had been driven out of Africa by the Vandals, and the latter by the Saracens about the middle of the seventh century, the Arabs continued masters of the country, divided into petty kingdoms under chiefs of their own choosing, till the year 1051, when Albubeker ben Omar, or, as the Spanish authors call him, Abu Texefien, provoked at the tyranny of those despots, gathered, by the help of his marabouts, or sain s, a powerful army of malcontents, in Numidia and Libya. His followers were named Morabites; by the Spaniards, Almoravides, probably from their being

assembled principally by the Mahomedan saints so called. The khalif of Kayem's forces were at this time taken up in quelling revolts in Syria, Mesopotamia, &c. and the Arabs in Spain engaged in the most bloody wars; so that Texefien, having nothing to fear from them, had all the success he could wish against the Arabian cheyks whom he repeatedly defeated, and at last drove out of Numidia, Libya, and all the western parts, reducing the whole province of Tingitania under his dominion. He was succeeded by his son Yusef, or Joseph, who laid the foundation of Morocco, which he designed for the capital of his empire. While that city was building, he sent ambassadors to Tremecen, at that time inhabited by a powerful sect of Mahomedans called Zeneti, proposing to bring them back to what he called the true faith; but the Zeneti, despising his offers, murdered his ambassadors, and invaded his dominions with an army of 50,000 men; whereupon he immediately led his army into their country, destroying all before him with fire and sword; while the Zeneti, instead of opposing his progress, retired as fast as possible towards Fez, in hopes of assistance. But in this they were miserably deceived, for the Fezzans coming up with the unhappy Zeneti, encumbered with their families and baggage, and ready to expire with hunger and weariness, cut them all to pieces, except a small number who were either drowned in attempting to swim across a river, or perished by falling from the adjacent rocks. Meantime Joseph reduced their country to a mere desert; but it was soon repeopled by a numerous colony of Fezzans, who settled there. In this war it is computed that near a million of the Zeneti, men, women, and children, lost their lives. Notwithstanding the assistance Joseph had thus received from the Fezzans, he declared war against them, reduced them to become his tributaries, and extended his conquest all along the Mediterranean. He next attacked those Arabian cheyks who had not yet submitted, taking many castles and fortresses, till then deemed impregnable; and at last completely subdued them. Thus was founded the empire of the Morabites, which, however, was of no long duration; that race being in the 12th century driven out by Mohavedin, a marabout. This race of priests was expelled by Abduiac governor of Fez; and he, in the 13th century, was stripped of his conquests by the Sharifs of Hascen, the descendants of those Arabian princes whom Abu-Texefien had formerly expelled. The better to secure their new dominions, the Sharifs divided them into several little kingdoms or provinces; and among these the present kingdom of Algiers was divided into four, viz. Tremecen, Tenez, Algiers Proper, and Bujeyah. The four first monarchs laid so good a foundation for a lasting balance of power between their little kingdoms, that they continued for some centuries in mutual amity; but at length the king of Tremecen having ventured to violate some of their articles, Abul Farez, king of Tenez, declared war against him, and obliged him to become his tributary. This king dying soon after, and having divided his kingdom among his three sons, new discords arose; which Spain taking advan-

tage of, sent a powerful fleet and army against Barbary, in 1505, under the count of Navare, who took Oran, Bujeyah, and some other important places; which so alarmed the Algerines, that they put themselves under the protection of Selim Eutemi, an Arabian prince. He came to their assistance with a great number of his bravest subjects, but was not able to prevent the Spaniards from landing a number of forces near Algiers, and making the Algerines tributary to Spain; or from building a strong fort on a small island opposite to the city, which terrified their corsairs from sailing either in or out of the harbour. They continued under this yoke until 1516; when, hearing of the death of Ferdinand, king of Spain, they sent to Aruch Barbarossa, who was at this time no less dreaded for his valour than for his surprising success, requesting him to join his forces with those of Selim Eutemi, and free them from the Spanish yoke; offering him a gratuity answerable to so great a service. Upon this Barbarossa immediately despatched eighteen galleys and thirty barks to the assistance of the Algerines: while he himself advanced towards the city with 800 Turks, 3000 Jigelites, and 2000 Moorish volunteers. In his road to Algiers, he surprised Hassan, another famed corsair, and obliged him to surrender; not without a previous promise of friendship: but no sooner had Barbarossa got him in his power, than he cut off his head; and obliged all Hassan's Turks to follow him in his new expedition. On Barbarossa's approach to Algiers, he was met by prince Selim, attended by the people, who looked for deliverance from this abandoned villain, whom they accounted invincible. He was conducted into the city amidst their acclamations, and lodged in one of the noblest apartments of prince Eutemi's palace, where he was treated with the greatest marks of honour. Elated beyond measure with this kind reception, Barbarossa formed a design of becoming king of Algiers; and fearing opposition from the inhabitants, on account of the excesses he suffered his soldiers to commit, caused prince Eutemi to be murdered at the baths, and caused himself to be proclaimed king; his Turks and Moors crying out as he rode along the streets, 'Long live King Aruch Barbarossa, the invincible king of Algiers, the chosen of God to deliver the people from the oppression of the Christians; and destruction to all that shall oppose, or refuse to own him as their lawful sovereign.' This last threatening so intimidated the inhabitants, already apprehensive of a general massacre, that he was immediately acknowledged king. The unhappy princess Zaphira, Selim's queen, poisoned herself, to avoid the brutality of this tyrant, whom she unsuccessfully endeavoured to stab with a dagger. After this, Barbarossa treated his subjects with such cruelty, that they used to shut up their houses and hide themselves when he appeared in public. A plot was formed against him, but being discovered, he caused twenty of the principal conspirators to be beheaded, and their bodies to be buried in a dunghill, and laid a heavy fine on those who survived; which so terrified the Algerines that they never afterwards

attempted any thing against him. Meantime, the son of prince Selim, having fled to Orar, and put himself under the protection of the marquis of Gomarez, laid before that nobleman a plan for putting the city of Algiers into the hands of the king of Spain. Upon this young Selim Eutemi was sent into Spain, to lay his plan before cardinal Ximenes; who, having approved of it, sent a fleet with 10,000 land forces, under the command of Don Diego de Vera, to drive out the Turks, and restore the young prince. But the fleet was no sooner come within sight of the land, than it was dispersed by a storm, and the greatest part of the ships dashed against the rocks. Most of the Spaniards were drowned; and the few who escaped were either killed by the Turks or made slaves. The king of Tenez made an attack upon him, but as the rest of the history of this bloody tyrant will be narrated under the article BARBAROSSA, it is only necessary to add here, that, after taking and plundering Tenez, and being chosen king of Tremecen, by the inhabitants, who were displeased with their own sovereign, he was at last killed by Abuchen-men, king of Tremecen, assisted by the Spaniards, in the forty-fourth year of his age, and second of his reign over Algiers. The circumstances of his defeat and death are related as follows: The prince of Tremen fleeing to Charles V. obtained an army of 10,000 under the command of the marquis Gomarez, who besieged him closely. Taking with him 1500 Turks and 5000 Moors, he sallied out upon his besiegers, but was obliged to retire and defend himself within the citadel of Tremecen. Seeing no other prospect of escape, he dug a subterraneous passage, by which means he left the city, but was pursued by some Spaniards, who, although he scattered plate and jewels in the way, would not suffer themselves to be diverted, and at last overtook him at Harxda, eight leagues from Tremecen, and despatched him. Abuchen-men was then declared king.

Although the news of Barbarossa's death spread the utmost consternation among the Turks at Algiers, they nevertheless proclaimed his brother Hayradin king; and the Spanish commander, having sent back the emperor's forces, without making any attempt upon Algiers, he lost the opportunity of driving the Turks out of that country; while Hayradin, justly dreading the consequences of the tyranny of his officers, sought the protection of the grand seignior. This was readily granted, and himself appointed bashaw or viceroy of Algiers; by which means he received such reinforcements, that the Algerines durst not make the least complaint; and such numbers of Turks resorted to him, that he became not only capable of keeping the Moors and Arabs in subjection at home, but of annoying the Christians at sea. His first step was to take the Spanish fort of Calan, which was a great nuisance to his metropolis, and though the Spaniards held out to the last extremity, he soon became master of it. He next set about building a strong mole for the safety of his ships. In this he employed 30,000 Christian slaves, whom he

obliged to work without intermission for three years, in which time the work was completed. He then caused the fort he had taken to be repaired, and placed a strong garrison in it, to prevent any foreign vessels from entering the harbour without giving an account of themselves. By these two important works, Hayradin soon became dreaded not only by the Arabs and Moors, but also by the maritime Christian powers, especially the Spaniards. The grand seignior having sent him a fresh supply of money, he was enabled to erect batteries on all places that might favour the landing of an enemy. All these have since received greater improvements from time to time, as often as there was occasion. Meantime the Sultan, either from a sense of the great services Hayradin had done, or out of jealousy lest he should make himself independent, raised Hayradin to the dignity of bashaw of the empire, and appointed Hassan Aga, a Sardinian renegado, and an experienced officer, to succeed him as bashaw of Algiers. Hassan had no sooner taken possession of his new government, than he began to pursue his ravages on the Spanish coast with greater fury than ever; extending them to the ecclesiastical state, and other parts of Italy; whereupon Pope Paul III. exhorted the emperor Charles V. to send a powerful fleet to suppress those cruel piracies; and, that nothing might be wanting to render the enterprise successful, a bull was published, wherein a plenary absolution of sins, and the crown of martyrdom, were promised to all who should either fall in battle or be made slaves. The emperor on his part needed no spur; and therefore set sail with a fleet of 120 ships and 20 galleys, having on board 30,000 chosen troops, and an immense quantity of money, arms, ammunition, &c. In this expedition many young nobility and gentry attended as volunteers, and many knights of Malta, so remarkable for their valour against the enemies of Christianity. Even ladies of birth and character attended Charles in his expedition, and the wives and daughters of the officers and soldiers followed them, with a design to settle in Barbary after the conquest was finished. The Algerines were greatly alarmed by this prodigious armament. The city was defended only by a wall, with scarce any outworks. The whole garrison consisted of 800 Turks and 6000 Moors, without fire arms, and poorly disciplined and accoutred; the rest of their forces being dispersed in the other provinces of the kingdom, to levy the usual tribute on the Arabs and Moors. The Spaniards landed without opposition, and immediately built a fort, under the cannon of which they encamped, and diverted the course of a spring which supplied the city with water. Being now reduced to the utmost distress, Hassan was on the point of surrendering, when advice was brought him that the forces belonging to the western government were in full march towards the place; upon which it was resolved to defend it to the utmost. Charles, in the mean time, resolving upon a general assault, kept a constant firing upon the town; which, from the weak defence made by the garrison, he looked upon as already his own. But

while the douwan or Algerine senate, were deliberating on the most proper means of obtaining an honourable capitulation, a mad prophet, named Yusel, attended by a multitude of people, entered the assembly, and foretold the speedy destruction of the Spaniards before the end of the moon, exhorting the inhabitants to hold out till that time. This prediction was soon accomplished in a very surprising and unexpected manner: for, on the 28th of October, 1541, a dreadful storm of wind, rain, and hail, arose from the north, accompanied with violent shocks of earthquakes, and an universal darkness, so that the elements seemed to combine together for the destruction of the Spaniards. In that night, some say in less than half an hour, eighty-six ships and fifteen galleys were destroyed, with all their crews and military stores; by which the army on shore was deprived of all means of subsisting in these parts. Their camp also, which spread itself along the plain under the fort, was laid quite under water by the torrents which descended from the neighbouring hills. Many of the troops, trying to remove into some better situation, were cut in pieces by the Moors and Arabs; while several galleys, and other vessels, endeavouring to gain some neighbouring creeks along the coasts, were immediately plundered, and their crews massacred by the inhabitants. Next morning Charles beheld the sea covered with the fragments of so many ships, and the bodies of men, horses, and other creatures, swimming on the waves; at which he was so disheartened, that abandoning his tents, artillery, and all his heavy baggage, to the enemy, he marched at the head of his army, though in no small disorder, towards cape Malabux, in order to re-imbarke in those few vessels which had outweathered the storm. But Hassan who watched his motions, allowed him just time to get to the shore, when he attacked the Spaniards in the midst of their hurry to get into their ships, killing great numbers, and bringing away a still greater number of captives; after which he returned in triumph to Algiers, where he celebrated his happy deliverance with great rejoicings. In this unfortunate expedition upwards of 120 ships and galleys were lost, above 300 land and sea officers, 8000 soldiers and marines, besides those destroyed by the enemy on the re-inbarkation, or drowned in the last storm. The number of prisoners was so great, that the Algerines sold some of them, by way of contempt, for an onion per head. Charles himself escaped with difficulty to Tunis with his few remaining followers. Hassan afterwards made his ally the king of Tremecen tributary, and returning to Algiers laden with riches, soon after died of a fever, in the sixty-sixth year of his age. After this Haji became king, and the Spaniards afterwards were never able to annoy the Algerines in any considerable degree. In 1555 they lost the city of Bujeyah, which was taken by Selha-Rais, Hassan's successor, who dying soon after of the plague, the Algerine soldiers chose a Corsican renegado, Hassan Corso, in his room, till they should receive farther orders from the Porte. He did not accept of the bashawship without a good deal of difficulty; and he had hardly enjoyed his dignity four months, before news came

that eight galleys were bringing a new bashaw to succeed him; one Tekelli, a principal Turk of the grand seignior's court: upon which the Algerines unanimously resolved not to admit him. By the treachery of the Levantine soldiers, however, he was admitted at last, and the unfortunate Corso thrown over a wall in which a number of iron hooks were fixed; one of which catching the ribs of his right side, he hung three days in the most exquisite torture before he expired. Tekelli was no sooner entered upon his new government, than he behaved with such cruelty and rapacity, that he was assassinated even under the dome of a saint, by Yusef Calabres, the favourite renegado of Hassan Corso; who, for this service, was unanimously chosen bashaw, but died of the plague six days after his election. Yusef was succeeded by Hassan, the son of Hayradin, who had formerly been recalled from his bashawship, when he was succeeded by Selha-Rais: and now had the good fortune to get himself reinstated in his employment. Next year the Spaniards undertook an expedition against Mostagan, under the command of the Count d'Alcandela; but were defeated, their commander killed, and 12,000 taken prisoners. Hassan having disengaged his subjects by allowing the mountaineers of Cuco to buy ammunition at Algiers, was sent in irons to Constantinople, while the aga of the Janisaries supplied his place. Hassan found means to clear himself: but a new bashaw was appointed, called Achinet; who was no sooner arrived, than he sent the two deputy bashaws to Constantinople, where their heads were struck off.—Achmet was a man of insatiable avarice, and had bought his dignity by the money he had amassed while head gardener to the Sultan. He enjoyed it, however, only four months; and after his death, the state was governed other four months by his lieutenant; when Hassan was a third time sent viceroy to Algiers, where he was received with the greatest demonstrations of joy. The first enterprise in which Hassan engaged, was the siege of Marsalquier, near Oran. His army consisted of 26,000 foot and 10,000 horse; and his fleet of thirty-two galleys and galliots, together with three French vessels laden with provisions. The city was defended by Don Martin de Cordova, brother of the Count d'Alcandela, who had been taken prisoner in the battle where that nobleman was killed, but had obtained his liberty from the Algerines with immense sums, and now made a most gallant defence against the Turks. The city was attacked with the utmost fury by sea and land, so that several breaches were made in the walls. The Turkish standards were several times planted on the walls, and as often dislodged; but the place must have in the end submitted, had not Hassan been obliged to raise the siege, on hearing that the famed Genoese admiral Doria was approaching with succours from Italy. The fleet accordingly arrived soon after; but missing the Algerine galleys, bore away for Pennon de Velez, where they were shamefully repulsed by a few Turks who garrisoned that place; which, however, was taken the following year. In 1567 Hassan was again recalled to Constantinople, where he died three years after. He was succeeded by Mahomet,

who gained the love of the Algerines by several public spirited actions. He incorporated the Janissaries and Levantine Turks together, and by that means put an end to their dissensions, which laid the foundation of the Algerine independency on the Porte. He likewise added some considerable fortifications to the city and castle, which he designed to render impregnable. But while he was thus studying the interest of Algiers, one John Gascon, a bold Spanish adventurer, formed a design of burning the whole piratic navy in the bay; but this plan, though patronised by king Philip II. proved abortive, owing to the dampness or improper mixture of the fire works; and Gascon himself, being taken prisoner, was barbarously slain by the Algerines. Mahomet, being soon after recalled, was succeeded by the famous renegado Ochali, who reduced the kingdom of Tunis; which, however, remained subject to the viceroy of Algiers only till the year 1586, when a bashaw of Tunis was appointed by the Porte. In 1585, under Memi Arnaud an Albanian, we first find the Algerines passing the Straits of Gibraltar, and extending their depredations as far as the Canary Islands, where they made a descent, carried off 300 persons (including the governor's family), with great plunder, but admitted some of the principal ladies to ransom. Early in the seventeenth century the government of the Algerines underwent considerable revolution.

Algiers, till the beginning of the seventeenth century, continued to be governed by viceroys appointed by the Porte; concerning whom we find nothing very remarkable, further than that their avarice and tyranny was intolerable both to the Algerines and the Turks. At last the Turkish Janissaries and militia becoming powerful enough to suppress the tyrannic sway of these bashaws, and the people being almost exhausted by the heavy taxes laid upon them, the former resolved to depose those petty tyrants, and set up some officers of their own at the head of the realm. The better to succeed in this attempt, the militia sent a deputation of some of their chief members to the Porte, to complain of the oppression of these bashaws, who sunk both the revenue of the state, and the money remitted to it from Constantinople, into their own coffers, which should have been employed in keeping up and paying the soldiery; by which means they were in continual danger of being overpowered by the Arabians and Moors, who, if ever so little assisted by any Christian power, would hardly fail of driving all the Turks out of the kingdom. They represented to the grand vizier how much more honourable, as well as easier and cheaper, it would be for the grand seignior to permit them to choose their own dey, or governor, from among themselves, whose interest it would then be to see that the revenue of the kingdom was rightly applied in keeping up its forces complete, and in supplying all other exigencies of the state, without any farther charge or trouble to the Porte than that of allowing them its protection. On their part, they engaged always to acknowledge the grand seigniors as their sovereigns, and to pay their usual allegiance and tribute, to respect their bashaws, and even to lodge,

and maintain them and their retinue, in a manner suitable to their dignity at their own charge. The bashaws, however, were, for the future, to be excluded from assisting at any but general douwans, unless invited; and from having the liberty of voting in them, unless when their advice was asked, or the interest of the Porte was likely to suffer by their silence. All other concerns, which related to the government of Algiers, were to be wholly left under the direction of the dey and his douwan. These proposals having been accepted by the Porte, the deputies returned highly satisfied; and having notified their new privileges, the great douwan immediately proceeded to the election of a dey from among themselves. They compiled a new set of laws, and made several regulations for the better support and maintenance of this new form of government, to the observation of which they obliged all their subjects to swear; and the militia, navy, commerce, &c. were all settled pretty nearly on the footing upon which they now are; though the altercations that happened between the bashaws and deys, the one attempting to recover their former power, and the other to curtail it, caused such frequent complaints at the Ottoman court, as made them often repent their compliance. In 1601, the Spaniards, under Doria the Genoese admiral, made another attempt upon Algiers, in which they were more fortunate than usual, their fleet being only driven back by contrary winds, so that they came off without loss. In 1609, the Moors being expelled from Spain, flocked in great numbers to Algiers; and as many of them were very able sailors, they undoubtedly contributed to make the Algerine fleet so formidable as it became soon after. In 1616 it consisted of forty sail, of between 200 and 400 tons, their admiral 500 tons. It was divided into two squadrons, one of eighteen sail, before the port of Malaga; and the other at the Cape of Santa Maria, between Lisbon and Seville; both of which fell foul on all Christian ships, both English and French, with whom they pretended to be in friendship, as well as Spaniards and Portuguese, with whom they were at war. The Algerines were now become very formidable to the European powers. The Spaniards, who were most in danger, and least able to cope with them, solicited the assistance of England, Rome, and other states. The French, however, were the first who dared to show their resentment of the perfidious behaviour of these miscreants; and in 1617 M. Beaulieu was sent against them with a fleet of fifty men of war, who defeated their fleet, took two of their vessels, while their admiral sunk his own ship and crew, rather than fall into his hands. In 1690 a squadron of English men of war was sent against Algiers, under Sir Robert Mansel; but it returned without doing any thing; and the Algerines, becoming more and more insolent, openly defied all the European powers, the Dutch only excepted; to whom, in 1625, they sent a proposal, directed to the prince of Orange, that in case they would fit out twenty sail of ships the following year, upon any good service against the Spaniards, they would join them with sixty sail of their own. Next year, the Coulolies, or Cologlies, the chil-

dren of such Turks as had been permitted to marry at Algiers, who were enrolled in the militia, having seized on the citadel, had well nigh made themselves masters of the city; but were attacked by the Turks and renegadoes, who defeated them with terrible slaughter. Many of them were executed; and their heads thrown in heaps upon the city walls, without the eastern gate. Part of the citadel was blown up; and the remaining Coulolies were dismissed from the militia, to which they were not again admitted till long after.

Amurath IV. in 1623, having made a truce for twenty-five years, with the emperor Ferdinand II. the Algerines and other states of Barbary threw off their dependence on the Porte altogether, and set up for themselves; and resolved, that whoever desired to be at peace with them must apply to their government. They accordingly began to make prizes of several merchant ships belonging to powers at peace with the Porte; and having seized a Dutch ship and poleacre at Scanderoon they ventured on shore, and finding the town abandoned by the Turkish aga and inhabitants, they plundered all the magazines and warehouses, and set them on fire. About this time Louis XIII. undertook to build a fort on their coast, instead of one formerly built by the Marsilians, and which they had demolished. This, after some difficulty, he accomplished; and it was called the Bastion of France: but the situation being afterwards found inconvenient, the French purchased the port of La Calle, and obtained liberty to trade with the Arabians and Moors. The Ottoman court, in the mean time, was so much embarrassed with the Persian war, that there was no leisure to check the Algerine pirates. This gave an opportunity to the vizier and other courtiers to compound matters with the Algerines, and to get a share of their prizes, which were very considerable. However, for form's sake, a severe reprimand, accompanied with threats, was sent them; to which they replied, that, 'these depredations deserved to be indulged to them, seeing they were the only bulwark against the Christian powers, especially against the Spaniards, the sworn enemies of the Moslem name:' adding, that 'if they should pay a punctilious regard to all that could purchase peace, or liberty to trade with the Ottoman empire, they would have nothing to do but set fire to all their shipping, and turn camel-drivers for a livelihood.' The Algerines continued to prosecute their piracies with impunity, to the terror and disgrace of the Europeans, till the year 1652; when a French fleet being accidentally driven to Algiers, the admiral took it into his head to demand a release of all the captives of his nation, without exception. This being refused, the Frenchman without ceremony carried off the Turkish viceroy, and his cadi or Judge, who were just arrived from the Porte, with all their equipage and retinue. The Algerines, by way of reprisal, surprised the bastion of France already mentioned, and carried off the inhabitants to the number of 600, with all their effects; which so provoked the admiral, that he sent them word, he would visit them another

next year with his whole fleet. The Algerines, undismayed by his threats, fitted out a fleet of sixteen galleys and galliots excellently manned and equipped, under the command of admiral Hali Pinchinin. The chief design of this armament was against the treasures of Loretto; which, however, they were prevented by contrary winds from obtaining. Upon this they made a descent on Naples, where they ravaged the whole territory of Nicotera, carrying off a vast number of captives, and among them some nuns. From thence steering towards Dalmatia, they scoured the Adriatic; and loading themselves with immense plunder, left those coasts in the utmost consternation. At last the Venetians, alarmed at such terrible depredations, equipped a fleet of twenty-eight sail, under the command of admiral Capello, with express orders to burn, sink, or take, all the Barbary corsairs he met with, either on the open seas, or even in the grand seignior's harbours, pursuant to a late treaty of peace with the Porte. The captain bashaw, who had been sent out with the Turkish fleet, to chase the Florentine and Maltese cruisers out of the Archipelago, understanding that the Algerine squadron was so near, sent orders to the admiral to come to his assistance. Pinchinin readily agreed: but having resolved on a descent upon the island of Lissa, belonging to the Venetians, he was overtaken by Capello, from whom he retired to Valona, a sea port belonging to the grand seignior, whither the Venetian admiral pursued him; but the Turkish governor refusing to eject the pirates according to the articles of the peace between the Ottoman court and Venice, Capello was obliged to content himself with watching them for some time. Pinchinin at last ventured out, when an engagement immediately ensued, in which the Algerines were defeated, and five of their vessels disabled, with the loss of 1500 men, Turks and Christian slaves; besides 1600 galley slaves who regained their liberty. Pinchinin, after this defeat, returned to Valona, where he was again watched by Capello; but the latter had not lain long at his old anchorage, before he received a letter from the senate, desiring him to make no farther attempt on the pirates at that time, for fear of a rupture with the Porte. This was followed by a letter from the governor of Valona, desiring him to take care lest he incurred the sultan's displeasure by such insults. The brave Venetian was forced to comply; but, resolving to take such a leave of the Algerines as he thought they deserved, observed how they had reared their tents, and drawn their booty and equipage along the shore. He then kept firing among their tents, while some well manned galliots and brigantines were ordered among their shipping, who attacked them with such bravery, that, without any great loss, they towed out their sixteen galleys, with all their cannon, stores, &c. In this last engagement, a ball from one of the Venetian galleys happening to strike a Turkish mosque, the whole action was considered as an insult upon the grand seignior. To conceal this, Capello was ordered to sink all the Algerine ships he had taken, except the Admiral; which was to be conducted to Venice, and laid up as a trophy.—

Capello came off with a severe reprimand ; but the Venetians were obliged to buy, with 500,000 ducats, a peace from the Porte. The grand seignior offered to repair the loss of the Algerines by building ten galleys for them, upon condition that they should continue in his service till the end of the ensuing summer ; but Pinchinin, who knew how little the Algerines chose to lie under obligations to him, civilly declined the offer.— Meantime, the news of this defeat filled Algiers with the utmost confusion. The whole city was on the point of a general insurrection, when the bashaw and douwan issued a proclamation, not only forbidding all complaints under the severest penalties, but all persons whomsoever, to take their thumbs from within their girdles, while they were deliberating on this important point. In the mean time they applied to the Porte for an order that the Venetians, settled in the Levant, should make up their loss. But with this the grand seignior refused to comply, and left them to repair their loss, as well as build new ships, the best way they could. It was not long, however, before they had the satisfaction to see one of their corsairs land with a fresh supply of 600 slaves, whom he had brought from the coast of Iceland, whither he had been directed by a miscreant native taken on board a Danish ship. Our pirates did not long continue in their weak and defenceless state ; being able, at the end of two years, to appear at sea with a fleet of sixty-five sail, which soon cleared the seas, and brought home vast numbers of slaves, and an immense quantity of rich spoils ; insomuch that the English, French and Dutch, were obliged to cringe to the mighty Algerines, who sometimes vouchsafed to be at peace with them, but swore eternal war against Spain, Portugal, and Italy, whom they looked upon as the greatest enemies to the Mahomedan name. At last Louis XIV. provoked by the outrages committed by the Algerines on the coasts of Provence and Languedoc, ordered, in 1681, a considerable fleet to be fitted out against them, under the Marquis Du Quesne, vice-admiral of France. His first expedition was against a number of Tripolitan corsairs ; who took shelter in the island of Scio, but pursuing them thither, he quickly destroyed fourteen of their vessels, besides battering the walls of the castle ; and finding they still continued their outrages on the French coast, he sailed to Algiers in August 1682, cannonading and bombarding it so furiously, that the whole town was in flames in a very little time. The great mosque was battered down, and most of the houses laid in ruins, insomuch that the inhabitants were on the point of abandoning the place ; when, on a sudden, the wind changed, and obliged Du Quesne to return to Toulon. The Algerines immediately made reprisals, by sending a number of galleys to the coast of Provence, where they committed the most dreadful ravages, and brought away a vast number of captives ; upon which a new armament was to be got ready at Toulon and Marseilles against the next year ; and the Algerines, having received timely notice, put themselves in as good a state of defence as the time would allow. In May 1683, Du Quesne with his squadron, cast

anchor before Algiers ; where, being joined by the marquis D'Affranville, at the head of five stout vessels, it was resolved to bombard the town. Accordingly 100 bombs were thrown into it the first day, which did terrible execution ; while the besieged made some hundred discharges of their cannon against them, without doing any considerable damage. The following nights the bombs were again thrown into the city in such numbers, that the dey's palace and other great edifices were almost destroyed ; some of their batteries were dismounted, and several vessels sunk in the port. The dey and Turkish bashaw as well as the whole soldiery, alarmed at this dreadful havock, immediately sued for peace.— As a preliminary, the immediate surrender was insisted on of all Christian captives who had been taken fighting under the French flag ; which being granted, 142 of them were immediately delivered up, with a promise of sending him the remainder as soon as they could be got from the different parts of the country. Accordingly Du Quesne sent his commissary-general and one of his engineers into the town ; but with express orders to insist upon the delivery of all the French captives without exception, together with the effects they had taken from the French ; and that Mezomorto their then admiral, and Hali Rais, one of their captains, should be given as hostages. This last demand having embarrassed the dey, he assembled the douwan, and acquainted them with it ; upon which Mezomorto fell into a violent passion, and told the assembly, that the cowardice of those who sat at the helm had occasioned the ruin of Algiers ; but that for his part he never would consent to deliver up any thing that had been taken from the French. He immediately acquainted the soldiery with what had passed ; which so exasperated them, that they murdered the dey that very night, and on the morrow chose Mezomorto in his place. This was no sooner done, than he cancelled all the articles of peace which had been made, and hostilities were renewed with greater fury than ever. The French admiral now kept pouring in such volleys of bombs, that in less than three days, the greatest part of the city was reduced to ashes, and the fire burned with such vehemence, that the sea was enlightened with it for more than two leagues round. Mezomorto, unmoved at all these disasters, and the vast number of the slain, whose blood ran in rivulets along the streets ; or rather, grown furious and desperate, sought only how to wreak his revenge on the enemy : and, not content with causing all the French in the city to be cruelly murdered, ordered their consul to be tied hand and foot, and fastened alive to the mouth of a mortar, from whence he was shot away against their navy. By this piece of inhumanity Du Quesne was so exasperated, that he did not leave Algiers till he had utterly destroyed all their fortifications, shipping, almost all the lower part, and above two-thirds of the upper part of the city ; by which means it became little else than a heap of ruins. The haughty Algerines were now thoroughly convinced that they were not invincible ; and, therefore, immediately sent an embassy into

France, begging in the most abject terms for peace; which Louis immediately granted, to their inexpressible joy.

The following copy of the speech, made by the Algerine envoy on this occasion, will give the reader an idea how deeply they felt the consequences of this defeat.

'Most high, most excellent, most powerful, magnanimous, and invincible Louis XIV. emperor of the French, whom God preserve, and make happy, I prostrate myself at the foot of thy sublime imperial throne, as the messenger of the joy with which our republic, and the dey, my master, have concluded a peace with thy lieutenant; and of their impatient desire, that thy sublime majesty will be pleased to put thy ratifying seal to it. The force of thy ever-victorious arms, and the strength of thy sword, have made them sensible of the fault which Baba Hassan committed, in declaring war against thy subjects. I am deputed hither to beg thy pardon for it, and to assure thee, in the sincerest terms, that, henceforth, our conduct shall be such as may deserve the friendship of the greatest emperor of the disciples of Jesus, and the only one we stand in dread of.

'The atrocious violence committed against the person of thy consul, is such as we should judge would prove an invincible obstacle to a peace if thy light, which, like that of the sun, penetrates all things, did not easily conceive how far an enraged and ungovernable populace can carry their furious resentment, in the midst of multitudes of their fellow-citizens, crushed in pieces by thy bombs; of which number they beheld their parents, brethren, and children, deprived either of life, effects, or liberty.

'But whatever their motives were, the violence we are far from excusing or extenuating. I come to beg of thee to turn for ever away thy sacred eyes from beholding a deed detested by all good men amongst us, especially those in power; who cannot therefore be justly charged with it.

'We hope, mighty emperor, great as Gemsehid, opulent as Kraour, magnificent as Solymam, and magnanimous as Akemptas, that thy clemency will not reject these our earnest prayers; and the high opinion we have of thy unparalleled generosity, gives us a kind of assurance, that thou wilt order all our brethren who wear thy chains to be set at liberty, as we ourselves have done, not only to thy subjects, but likewise to those who were under the shadow of thy august name; that the joy for this peace may become equal and universal; and that a much greater number of mouths may be thereby opened to celebrate thy praise. That, when thy subjects return to their country, they may thankfully come and throw themselves at thy feet, while our's proclaim thy praise throughout the vast countries of Africa, and imprint in their children a veneration for thy incomparable virtues, and a due regard for the French nation.

'This will prove the happy foundation of an eternal peace; of which we promise an exact and religious observance on our part, in all its articles; not doubting but it will be equally observed by thy subjects; from whom thy authority claims an unlimited obedience.

VOL. I

'May the almighty and gracious Creator give a blessing upon this peace, and maintain a perpetual union between the most high, most excellent, and most magnanimous emperor of the French, and the most illustrious and magnificent bashaw, dey, douwan, and the victorious armies of the republic of Algiers.'

Fearful of his predecessor's fate, the ferocious dey now abdicated the sovereignty; and the disputes which took place between the Turkish viceroys and the Algerine deys, occupy the principal part of their domestic history to the conclusion of this century, when the Porte united the two dignities into one. They now began to pay some regard to other nations, and to be a little cautious how they wantonly incurred their displeasure. The first bombardment by the French had so far humbled the Algerines, that they condescended to enter into a treaty with England; which was renewed, upon terms very advantageous to the latter, in 1686. This was renewed, at various periods, by James II., William III., and Geo. II. It is not to be supposed, however, that the habitual perfidy of the Algerines would disappear on a sudden: notwithstanding this treaty, they lost no opportunity of making prizes of the English ships when they could conveniently come at them. Upon some infringement of this kind, captain Beach drove ashore, and burnt seven of their frigates in 1695; which produced a renewal of the treaty five years after: but it was not till the taking of Gibraltar and Port Mahon that Britain could have a sufficient check upon them to enforce the observation of treaties; and these have since proved such restraints upon Algiers, that they still continue to pay a greater deference to the English than to any other European power. The last century furnishes no very remarkable events in the history of Algiers, except the taking of the famous city of Oran from the Spaniards in 1708, which they retook in 1737, and the expulsion of the Turkish bashaw, and uniting his office to that of dey in 1710. This introduced the form of government which still continues in Algiers.

During the general peace of the European continent in 1816, the British government felt inclined to enter into some more permanent engagements with this people. They were required to treat the inhabitants of the Ionian isles as British subjects; a peace was negotiated by our commander between the Barbary states and Sardinia and Naples, and the abolition of all Christian slavery. These proposals, the last excepted, met the dey's approbation; but, with respect to the last, as he was a subject of the Porte, he required a delay of six months to enable him to consult his government. Lord Exmouth agreed to wait three months, but had scarcely quitted the shores, when a most barbarous outrage on the coral fisheries at Bona, where a number of Corsicans, Neapolitans, and Italians, had long resorted for coral, under the protection of the British flag, summoned him to return. On the 23d of May, a body of Algerine infantry and cavalry, to the number of 2000, attacked their boats; the fire of the forts opened upon

2 R

them at the same time, the British flags were seized and trampled underfoot, and nearly the whole of the crews barbarously butchered. Our government immediately resolved to punish this insulting barbarity; and, accordingly, the Impregnable of ninety-eight guns, three ships of seventy-eight guns, four frigates, and several smaller vessels, gun-boats, &c., were commanded to rendezvous at Gibraltar, where they were joined by five Dutch frigates and a sloop, and appeared before Algiers on the 18th of August. Here they found that very considerable additions had been made to the fortifications, that new works had been thrown up on both flanks of the town, that the ships were all in port, and between forty and fifty mortar and gun boats, while an army of 40,000 troops had been collected from the interior.

After a fruitless message to the dey on the morning of the 27th of August, Lord Exmouth in the Queen Charlotte personally commenced the attack, which was seconded by the whole fleet of English, and well supported by the Dutch. After twelve hours incessant firing the whole Algerine fleet was destroyed, and at least half of the town. The fleet then retired to anchor beyond those of the enemy's batteries and mortars which were still undemolished, and the following morning the British Admiral had the satisfaction to receive from the dey the full acknowledgment of all the proposals made by the British government in the following treaty.

1. The abolition of Christian slavery.
2. The delivery to the British flag of all slaves in the dominions of the dey, to whatever nation they may belong, at noon on the 31st of August.
3. To deliver also to the British flag all money received by the dey, for the redemption of slaves since the commencement of this year, at noon also of the same day.
4. Reparation being made to the British consul for all losses he may have sustained in consequence of his confinement.
5. The dey making a public apology, in presence of his ministers and officers, and begging pardon of the consul in terms dictated by the captain of the Queen Charlotte.

Lord Exmouth had the satisfaction of informing the British Admiralty, on the 1st of September, that all the slaves in Algiers were already embarked, with 357,000 dollars for Naples, and 25,000 for Sardinia.

The dey is now absolute monarch, and pays no other revenue to the Porte, than that of a certain number of fine boys, and some presents which are sent thither yearly. His own income rises or falls according to the opportunities he has of fleecing both natives and foreigners: whence it is variously computed by different authors. Dr. Shaw computes the taxes of the whole kingdom to bring into the treasury no more than 300,000 dollars; but supposes that the eighth part of the prizes, the effects of those persons who die without children, joined to the yearly contributions raised by the government, presents from foreigners, fines and oppressions, may bring in about as much more. Both the dey, and officers under him, enrich themselves by rapine and fraud; which it is no wonder to find the common people practising upon one

another, and especially upon strangers, seeing they themselves are impoverished by heavy taxes, and the injustice of those who are in authority. It is generally known, that the first beys were elected by the militia, who were then called the douwan, or common-council. This elective body was at first composed of 800 militia officers, without whose consent the dey could do nothing; and upon some urgent occasions all the officers residing in Algiers, amounting to above 1500, were summoned to assist. But since the deys, who may be compared to the Dutch Stadholders, have become more powerful, the douwan is principally composed of thirty chiah-bashaws, or colonels, with now and then the inufti and eadi upon some emergencies; and on the election of a dey, the whole soldiery are allowed to come and give their votes. All the regulations of state ought to be determined by that assembly, before they pass into a law, or the dey hath power to put them in execution; but, for many years back, the douwan is of so little account, that it is only convened out of formality, and to give assent to what the dey and his chief favourites have concerted beforehand. The method of gathering the votes in this august assembly is perfectly agreeable to the character of those who compose it. The aga, or general of the janissaries, or the president pro tempore, first proposes the question; which is immediately repeated with a loud voice by the chiah-bashaws, and from them echoed again by four officers called bashaldalas, from these the question is repeated from one member of the douwan to another, with strange contortions, and the most hideous growlings, if it is not to their liking. From the loudness of this growling noise, the aga is left to guess as well as he can whether the majority of the assembly are pleased or displeased with the question; and from such a preposterous method, it is not surprising that these assemblies should seldom end without some tumult or disorder. As the whole body of the militia is concerned in the election of a new dey, it is seldom carried on without blows and bloodshed: but when once the choice is made, the person elected is saluted with the words Alla barrick, 'God bless you and prosper you;' and the new dey usually causes all the officers of the douwan to be strangled, filling up their places with those who had been most zealous in promoting it. From this account of the election of the deys, it cannot be expected that their government should be at all secure; and as they arrive at the throne by tumult, disorder, and bloodshed, they are generally deprived of it by the same means, scarcely one in ten of them having the good fortune to die a natural death.

The officer next in power to the dey is the aga of the janissaries, who is one of the oldest officers in the army, and holds his post only for two months. He is then succeeded by the chiah, or next senior officer. During the two months in which the aga enjoys his dignity, the keys of the metropolis are in his hands; all military orders are issued out in his name; and the sentence of the dey upon any offending soldier, whether capital or not, can only be executed in the court of his palace. As soon as he has gone through his

short office, he is considered as mazoul, or superannuated; receives his pay regularly, like the rest of the militia, every two moons; is exempt from all further duties, except when called by the dey to assist at the grand council, to which he has, however, a right to come at all times, but has no longer a vote in it.—Next to the aga in dignity, is the secretary of state, who registers all the public acts; and after him are the thirty chiahs, or colonels, who sit next to the aga in the douwan, and in the same gallery with him. Out of this class are generally chosen those who go ambassadors to foreign courts, or who disperse the dey's orders throughout the realm.—Next to them are 800 bolluk-bashaws, or eldest captains, who are promoted to that of chiah-bashaws, according to their seniority. The oldah-bashaws, or lieutenants, are next; who amount to 400, and are regularly raised to the rank of captains in their turn, and to other employments in the state according to their abilities. These, by way of distinction, wear a leather strap, hanging down to the middle of their back. One rule is strictly observed in the rotation of these troops from one deputy to a higher; viz. the right of seniority; one single infringement of which would raise an insurrection, and probably cost the dey his life. Other military officers of note are the vakelards, or purveyors of the army; the peys, who are the four oldest soldiers, and consequently the nearest to preferment; the soulacks, who are the next in seniority to them, and are part of the dey's body-guard, always marching before him when he takes the field and distinguished by their carbines and gilt scimitars, with a brass gun on their caps; the kayts, or Turkish soldiers, each band of whom have the government of one or more adowars, or itinerant villages, and collect their taxes for the dey; and the sagiards, or Turkish lance-men, 100 of whom always attend the army, and watch over the water appointed for it. To these we may add the beys, or governors of the three great provinces of the realm. All the above-mentioned officers ought to compose the great douwan or council above-mentioned; but only the thirty chiah-bashaws have a right to sit in the gallery next after the dey: the rest are obliged to stand on the floor of the hall, or council-chamber, with their arms across, and, as much as possible, without motion; neither are they permitted to enter with their swords on, for fear of a tumult. As for those who have any matters, to transact with the douwan, they must stand without, let the weather be ever so bad; and there they are commonly presented with coffee by some of the inferior officers, till they are dismissed.

Algiers with regard to its government is, as we have already intimated, by some styled a republic; but if it is not a perfect despotism, it can at best be only ranked as a vile oligarchy. It does not even merit the title of an aristocratic commonwealth. The powerful party of Turks always to be found in this part keep the government in their own hands, and the natives have no share. Algiers is at present divided into three provinces, viz. the eastern, western, and southern. The eastern, or Levant-

tine government, which is by far the most considerable of the three, and is also called Beylick contains the towns of Bona, Constantina, Gigeri, Bujeyah, Stessa, Tebez, Zamoura, Biscara, and Necanz, in all which the Turks have garrisons; besides which, it includes the two ancient kingdoms of Cuco and Labez, though independent of the Algerine government, to whose forces their country is inaccessible; so that they still live under their own cheyks chosen by each of their adowars or hords. To these we may add a French factory at Callo, under the direction of the company of the French Bastion.—The western government hath the towns of Oran, Tremeen, Mostagan, Tenez, and Secrelly, with its castle and garrison.—The southern government has neither town, village, nor even a house, all the inhabitants living in tents, which obliges the dey and his forces to be always encamped.

In this country it is not to be expected that justice will be administered with any degree of impartiality. It is ordinarily administered by the cadi, who attends a kind of police court twice a day; but principal causes are referred to the dey. The Mahomedan soldiery are so much favoured, that they are seldom put to death for any crime, except rebellion; in which case they are either strangled with a bow-string, or hanged to an iron hook. In lesser offences they are fined, or their pay stopped; and if officers, they are reduced to the station of common soldiers, from whence they may gradually raise themselves to their former dignity. Women guilty of adultery, have a halter tied about their necks, with the other end fastened to a pole, by which they are held under water till they are suffocated. The bastinado is likewise inflicted for small offences; and is given either upon the belly, back, or soles of the feet, according to the pleasure of the cadi; who also appoints the number of strokes. These sometimes amount to 200 or 300, according to the indulgence the offender can obtain, either by bribery or friends; and hence many die under this punishment, for want of advocates sufficiently powerful. But the most terrible punishments are those inflicted upon the Jews or Christians who speak against Mahomet or his religion; in which case, they must either turn Mahomedan, or be impaled alive. If they afterwards apostatize, they are burned or roasted alive, or else thrown down from the top of the city walls upon iron hooks, where they are caught by different parts of their body, according as they happen to fall, and sometimes expire in the greatest torments; though by accident they may be put out of pain at once. This terrible punishment, however, begins now to be disused.

The coin in circulation at Algiers is chiefly that of the foreign commercial nations; the Spanish doubloon and dollar are those most commonly seen: the sultanates of gold pass for two dollars. Beside these, there is a copper barba, having the arms of the country on each side, and a square silver asper, worth about an English crown. The pata chica is an ideal sum, like the pound English, equal to 232 aspers.

With respect to trade, we observe the corsairs, or pirates, form a small republic, of which the

rais or captain is the supreme bashaw; who, with the officers under him, form a kind of douwan, in which every matter relating to the vessel is decided in an arbitrary way. These corsairs are chiefly instrumental in importing whatever commodities are brought into the kingdom either by way of merchandise or prizes; which consist chiefly of gold and silver, stuffs, damasks, cloths, spices, tin, iron, plated brass, lead, quicksilver, cordage, sail-cloth, bullets, cochineal, linen, tartar, alum, rice, sugar, soap, cotton, raw and spun, copperas, aloes, Brazil and log-wood, vermillion, &c. Very few commodities, however, are exported from this part of the world; the oil, wax, hides, pulse, and corn produced, being but barely sufficient to supply the country; though before the loss of Oran, the merchants have been known to ship off from one or other of the ports of Barbary, several thousand tons of corn. The consumption of oil, though here in great abundance, is likewise so considerable in this kingdom, that it is seldom permitted to be shipped off for Europe. The other exports consist chiefly in ostrich feathers, copper, rugs, silk sashes, embroidered handkerchiefs, dates, and Christian slaves. Some manufactures in silk, cotton, wool, leather, &c. are carried on in this country, but mostly by the Spaniards settled here, especially about the metropolis. Carpets are also a manufacture of the country, which, though inferior to those of Turkey, both in beauty and fineness, are preferred by the people to lie upon, on account of their being both cheaper and softer. There are also, at Algiers, looms for velvet, taffaties, and other wrought silks; and a coarse sort of linen is likewise made in most parts of the kingdom. The country furnishes no materials for ship building. They have neither ropes, tar, sails, anchors, nor even iron. When they can procure enough of new wood to form the main timbers

of a ship, they supply the rest from the materials of prizes which they have made; and thus produce new and swift sailing vessels from the ruins of the old. Of all the states on the coast of Barbary, Algiers is the strongest at sea.

A squadron making a prize immediately drafts out the crew, and replaces it with men from her own; she is then hastened to Algiers, or a neighbouring friendly port, the flag of the vanquished enemy is displayed under that of the corsair, and several guns announce the capture. Consigning her slaves to the captain of the port, the cruiser returns to sea; but the first step towards a final disposal of the cargo, is to submit an inventory of the whole to the dey, whose legal property every capture is supposed to be, but who contents himself, generally, with an eighth of the value, and a capricious selection of the slaves. All Christian slaves who are on board an Algerine when she makes a capture, are said to be allowed their regular share of the prize.

The slaves intended for sale are marched to the basistan, or auction mart, and made to exhibit their powers of action by walking backwards and forwards, as we exhibit a horse; a crier being in attendance to announce their number, trades, and respective qualities. There are middle-men, or brokers, in this disgraceful traffic, who speculate upon parties likely to be ransomed, or to pay them for their temporary maintenance. Working on board the galleys of the corsairs, keeping up the public roads and works, and all kinds of domestic servitude, are the lot of these unhappy captives. The women of better appearance, in a company of new slaves, are committed to the care of an officer, called the checkelbeld, until offers for their ransom are made; poorer females are consigned at once to any treatment that their Turkish or Moorish masters may think proper to inflict.

ALGOA, or **ZWARTKOPS BAY**, an inlet of the southern coast of Africa, east of the Cape of Good Hope, from which it is distant about 500 English miles, being situated in south lat. 33°. 56' and east long. 26°. 53'.

This bay, in the neighbourhood of which it is projected by government to found a new and important colony, is about twenty miles in breadth from east to west, and the shore is a level sandy beach, except from the usual landing place to its western extremity. The bottom is good holding ground. A heavy swell rolls in from the eastward, and the bay is open to all winds that blow from north-east to south-east; so that it at present affords but a very imperfect shelter against the most prevailing gales. On the west, about a mile out, is good anchorage in five fathoms; in the bay the tide rises between six and seven feet. It receives the Sunday, Kowie, and Zwartkops rivers, and has some fine springs of water near the landing place on the western side. The bar of the Zwartkops is sometimes open, and at other times closed; but within the bar the river is navigable for small vessels several miles.

A slip of land about 4000 feet in length, and

500 wide, is here sheltered on one side by a ridge of sand hills, and on the other by a sudden rise of the country. The soil is fruitful, and presents a fine situation for a fishing village. The black whale abounds in the bay; a large natural salt pan is found in the neighbourhood, and solid advantages might be derived to the nation, and to the East India Company in particular, it would seem, by an establishment formed on this spot for salted beef and fish. Superior cattle to those of the Cape are found in this neighbourhood, and Mr. Barrow conjectures that beef could be yielded here at sixpence per pound, or even under that price, to shipping. Hides and skins might also be salted and become a valuable export. Those of the wild animals here, (particularly of the antelope), even with the native dressing, make excellent leather; the surrounding country is fertile in corn, and has several noble woods within a short distance from the bay. 'The country about Zwartkops bay,' says the enlightened traveller we have just named, 'seems to be well adapted for the cultivation of grain. The farmers here give themselves no trouble to manure the land, yet reckon upon a return of twenty-five, thirty, and even forty, for one, es-

pically if a stream of water can occasionally be turned upon the ground. On stiff clayey land a small quantity of sheep's dung is sometimes employed to prevent the fragments from clogging together, and so make the parts less tenacious. The little value they attach to manure is obvious from the heaps of dung that are piled about the houses in those places where the cattle, in order to preserve them from beasts of prey, are pent up at night. These consist of circular or square spaces, shut in by dead branches of the thorny mimosa, which are called kraals, a name they have also thought proper to transfer to the collected huts of the Hottentots and Caffres. The beds of some of these kraals were not less than twelve feet deep of dung, unmixed with any other material; but this is neither the only nor the least offensive nuisance with which the hovel of a Dutch peasant is usually surrounded.

The great fertility of the land in this part of the colony, is not, however, any inducement to the farmer to extend the cultivation of grain beyond the present limited quantity, as he can have no demand for his produce unless a regular coasting trade were established. They would be very glad to find a market for their grain at a fixed contract price, even as low as two shillings and eight pence for a Winchester bushel, delivered in Zwartkops bay. (This was in 1797.) The wheat of the Cape is a large full grain, weighing usually from sixty-one to sixty-six pounds a bushel. Immediately after the capture a small cargo was sent to Europe, which sold at Mark-lane market at a higher price than the best English wheat that appeared on the same day.

Zuurveldt is on the east side of this bay, and the capital of the new district of Uitenhagen stands to the north of it, and on the Zwartkops river. Fort Frederick is a recent establishment on the shores of the bay, surrounded by a few houses.

ALGOIDES, in botany, a name given by Vaillant to a species of plants, called by Michelii and Linnæus zannichellia. Also an aquatic plant so called from its resemblance to the alga, having imperfect hermaphrodite flowers.

ALGOL, or MEDUSA'S HEAD, a fixed star of the third magnitude, in the constellation Perseus; lon. $21^{\circ} 50' 42''$. of Taurus; lat. $23^{\circ} 23' 47''$ N. according to Flamsteed. This star has been subject to singular variations, appearing at different times of different magnitudes, from the fourth to the second which is its usual size. This is supposed to be owing either to the interposition of a large body revolving round Algol, or to some portion of its own; in consequence of which, part of its body covered with spots, or such like matter, is periodically turned towards the earth.

ALGON, a small island of Sweden, on the west coast of the gulf of Bothnia. Long. $18^{\circ} 26'$. E. lat. $63^{\circ} 9'$. N.

ALGONQUINS, the name of several tribes of savage Indians, who inhabit different parts of North America, but all supposed to proceed from a common origin. The Algonquins of Canada were formerly numerous; but their

present number, according to Mackenzie, does not exceed 150 families.

The Algonquins of Rainy Lake inhabit a country, the precise limits of which are not accurately known. The country which they possess has been much hunted, and its game is now nearly exhausted; in consequence of which they roam about in detached parties in quest of a precarious subsistence. They are immoderately fond of spirits, of which large quantities are furnished them by the north-west traders, in return for their furs and other commodities.

The Algonquins who inhabit Portage de Prairie, possess a low, flat, and marshy country, mostly covered with timber, and filled with game. They are emigrants from the lake of the woods, and the country east of it, and were settled in their present abodes by the north-west traders, that they might hunt the country on the lower parts of Red River. They are orderly, well disposed, and immoderately addicted to spirit drinking.

As hunters and warriors, the Algonquins had no rivals, and were once closely connected with the Iroquois Indians, and considered as their protectors; but their allies and protégés began to rival their former masters in the arts of hunting and of war, and jealousies arose which almost proved fatal to the existence of the Algonquins, although they were assisted by the French. The language of the Algonquins is considered as the most ancient and copious of the three radical tongues of the North American Indians, and is preferred to either the Huron or the Sioux. There is a church devoted to the Romish religion in their territory; but the exertions of the priesthood have hitherto had little effect on their morals: they are in the general practice of polygamy, and given to the use of intoxicating liquors as much as ever. The country around them is cultivated in miserable and detached patches of ground, and this solely by their women, the men being engrossed with fishing and hunting. The residence of the first chief, or Sachem, of all the Algonquin tribes, is at the trading establishment, situate on a high bank on the north side of the river la Pluie, in north lat. $48^{\circ} 37'$. This chief is by way of distinction called Nectam, implying personal pre-eminence. In this place the elders meet in council to treat of peace, war, and other public concerns.

ALGORAB, a fixed star, of the third magnitude, in the right wing of the constellation Corvus, marked (δ) by Bayer.

ALGORITHM, an Arabic term for the art of numbering truly and readily, comprehending the six common rules of arithmetic, and called logistica numeralis. We say the algorithm of integers, the algorithm of fractions, the algorithm of surds, &c.

ALGOSAREL, in botany, a name used by Avicenna, and some other authors, for the dauranda deus carotta of Linnæus.

ALGOZO, a small town of Portugal, in Traz-montes, twenty miles west-south-west of Miranda de Duero.

ALGUAZIL, in the Spanish polity, an officer

whose business it is to see the decrees of a judge executed.

ALHABOR, the Arabian name for the star called Sirius

ALHAGI, in botany, the trivial name of a species of *hedysarum*. See *HEDYSARUM RUS.*

ALHAMA, a populous and well built town of Granada, in Spain, situated in the midst of craggy mountains, about twenty-five miles southwest of Granada, on the banks of the Motril, and having the finest warm baths in all Spain. It was taken from the Moors in 1481, when the inhabitants, though surprised, and the town without a garrison, made a gallant defence; but being at length forced to submit, the place was abandoned to the pillage of the Christian soldiers, who, not satisfied with an immense quantity of gold and jewels, made slaves of upwards of 3000 of the inhabitants. Lon. 3°. 24'. W. lat. 36°. 49'. N.

ALHAMBRA, an ancient fortress, and residence of the Moorish monarchs of Granada. It derives its name from the red colour of the materials with which it was originally built, Alhambra signifying a red house. It appears to a traveller a huge heap of ugly buildings as can well be seen, all huddled together, seemingly without the least intention of forming one habitation out of them. The walls are entirely unornamented, all gravel and pebbles, daubed over with plaster in a very coarse manner: yet this is the palace of the Moorish kings of Granada, and it is indisputably the most curious place that exists in Spain, perhaps in the world. In many countries may be seen excellent modern, as well as ancient architecture, both entire and in ruins; but nothing to be met with anywhere else can convey an idea of this edifice, except the decorations of an opera, or the tales of the genii.

Passing round the corner of the emperor's palace, one is admitted at a plain unornamented door in a corner. 'On my first visit,' says Swinburne, in his Travels in Spain, 'I confess I was struck with amazement, as I stepped over the threshold, to find myself on a sudden transported into a species of fairy land. The first place you come to is the court called the communa or del mesucar, that is, the common baths; an oblong square, with a deep basin of clear water in the middle; two flights of marble steps leading down to the bottom; on each side a parterre of flowers, and a row of orange trees. Round the court runs a peristyle paved with marble; the arches bear upon very slight pillars, in proportions and style different from all the regular orders of architecture. The ceilings and walls are encrusted with fret work in stucco, so minute and intricate, that the most patient draughtsman would find it difficult to follow it, unless he made himself master of the general plan. This would facilitate the operation exceedingly; for all this work is frequently and regularly repeated at certain distances, and has been executed by means of square moulds applied successively, and the parts joined together with the utmost nicety. In every division are Arabic sentences of different lengths, most of them expressive of the following meanings:

'There is no conqueror but God;' or, 'Obedience and honour to our lord Abouabdoulah.' The ceilings are gilt or painted, and time has caused no diminution in the freshness of their colours, though constantly exposed to the air. The lower part of the wall is mosaic disposed in fantastic knots and festoons. The porches at the end are more like grotto work than any thing else to which they can be compared. That on the right hand opens into an octagon vault, under the emperor's palace, and forms a perfect whispering gallery, meant to be a communication between the offices of both houses. Opposite to the door of the communa through which you enter, is another leading into the quarto de los leones, or apartment of the lions, which is an oblong court, 100 feet in length, and fifty in breadth, environed with a colonnade seven feet broad on the sides and ten at the end. Two porticos or cabinets about fifteen feet square, project into the court at the two extremities. The square is covered with coloured tiles; the colonnade with white marble. The walls are covered five feet up from the ground with blue and yellow tiles disposed chequerwise. Above and below is a border of small escutcheons, enamelled blue and gold, with an Arabic motto on a bend; signifying, 'No conqueror but God.' The columns that support the roof and gallery are of white marble, very slender and fantastically adorned. They are nine feet high, including base and capital, and eight inches and a half diameter. They are very irregularly placed; sometimes singly, at others in groups of three, but more frequently two together. The width of the horse-shoe arches above them is four feet two inches for the large ones, and three for the smaller. The ceiling of the portico is finished in a much finer and more complicated manner than that of the communa, and the stucco laid on the walls with inimitable delicacy; in the ceiling it is so artfully frosted and handled as to exceed belief. The capitals are of various designs, though each design is repeated several times in the circumference of the court, but not the least attention has been paid to placing them regularly or opposite to each other. Not the smallest representation of animal life can be discovered amidst the varieties of foliages, grotesques, and strange ornaments. About each arch is a large square of arabesques, surrounded with a rim of characters, that are generally quotations from the Koran. Over the pillar is another square of delightful filagree work. Higher up is a wooden rim, or kind of cornice, as much enriched with carving as the stucco that covers the part underneath. Over this projects a roof of red tiles, the only thing that disfigures this beautiful square. This ugly covering is modern, put on by order of Mr. Wall, the late prime minister. In the centre of the court are twelve ill-made lions muzzled, their fore parts smooth, their hind parts rough, which bear upon their backs an enormous basin out of which a lesser rises. While the pipes were kept in good order, a great volume of water was thrown up; which, falling down into the basins, passed through the beasts, and issued out of their mouths into a large reservoir, where it communicated by channels

with the jets d'eaux in the apartments. This fountain is of white marble, embellished with many festoons and Arabic distiches, complimenting the monarch and his princes. Passing along the colonnade, and keeping on the south side, you come to a circular room used by the men as a place for drinking coffee and sorbets in. A fountain in the middle refreshed the apartment in summer. The form of this hall, the elegance of its copula, the cheerful distribution of light from above, and the exquisite manner in which the stucco is designed, painted, and finished, exceed all powers of description. Every thing in it inspires the most pleasing, voluptuous ideas; yet in this sweet retreat, they say, that Abouabdoulah assembled the Abencerrages, and caused their heads to be struck off into the fountain. Continuing your walk round, you are next brought to a couple of rooms, at the head of the court, which are supposed to have been tribunals, or audience chambers. Opposite to the Sale de las Abencerrages is the entrance into the Torre de las dos hermanas, or the tower of the two sisters; so named from two very beautiful pieces of marble laid as flags in the pavement. This gate exceeds all the rest in profusion of ornaments, and in the beauty of prospect which it affords through a range of apartments, where a multitude of arches terminate in a large window open to the country. In a gleam of sunshine the variety of tints and lights thrown upon this entilade are uncommonly rich. The first hall is the concert room, where the women sat; the musicians played above in four balconies. In the middle is a jet d'eau. The marble pavement is equal to the finest existing, for the size of the flags and evenness of the colour. The two sisters are slabs that measure fifteen feet by seven and a half, without flaw or stain. The walls, up to a certain height, are mosaic, and above are divided into very neat compartments of stucco, all of one design, which is also followed in many of the adjacent halls and galleries. The ceiling is a fretted cove. To preserve this vaulted roof, as well as some of the other principal cupolas, the outward walls of the towers are raised ten feet above the top of the dome, and support another roof over all, by which means no damage can ever be caused by wet weather or excessive heat and cold. From this hall you pass round the little myrtle garden of Lindarax, into an additional building made to the east end by Charles V. The rooms are small and low. His favourite motto, 'Plus outré,' appears on every beam. This leads to a little tower, projecting from the line of the north wall, called El tocader, or the dressing-room of the sultana. It is a small square cabinet, in the middle of an open gallery, from which it receives light by a door and three windows. The view is charming. In one corner is a large marble flag, drilled full of holes, through which the smoke of perfumes ascended from furnaces below; and here, it is presumed, the Moorish queen was wont to sit to fumigate and sweeten her person. The emperor caused this room to be painted with representations of his wars, and a great variety of grotesques, which appear to be copies, or at least imitations, of those in the lobby of the Vatican. From hence you go through a long passage to the hall of

ambassadors, which is magnificently decorated with innumerable varieties of mosaics, and the mottoes of all the kings of Granada. This long narrow antichamber opens into the communia on the left hand, and on the right into the great audience hall in the tower of Comares, a noble apartment, thirty-six feet square, thirty-six high up to the cornice, and eighteen from thence to the centre of the cupola. The walls on three sides are fifteen feet thick, on the other, nine; the lower range of windows thirteen feet high. The whole wall is inlaid with mosaic of many colours, disposed in intricate knots, stars and other figures. In every part various Arabic sentences are repeated. Having completed the tower of the upper apartments, which are upon a level with the offices of the new palace, you descend to the lower floor, which consists of bed-chambers and summer rooms: the back stairs and passages, that facilitated the intercourse between them, are without number. The most remarkable room below is the king's bed-chamber, which communicated, by means of a gallery, with the upper story. The beds were placed in two alcoves, upon a raised pavement of blue and white tiles; but as it was repaired by Philip V. who passed some time here, it cannot be said how it may have been in former times. A fountain played in the middle, to refresh the apartment in hot weather. Behind the alcoves are small doors that conduct you to the royal baths. These consist of one small closet with marble cisterns for washing children, two rooms for grown-up persons, and vaults for boilers and furnaces that supplied the baths with water and the stoves with party coloured earthenware; light is admitted by holes in the ceiling. Hard by is a whispering gallery, and a kind of labyrinth said to have been made for the diversion of the women and children. One of the passages of communication is fenced off with a strong iron gate, and called the prison of the sultana; but it seems more probable that it was put up to prevent any body from climbing up into the women's quarter. Under the council room is a long slip, called the king's study: and adjoining to it are several vaults, said to be the place of burial of the royal family. In the year 1574, four sepulchres were opened; but as they contained nothing but bones and ashes, were immediately closed again. This noble palace, however, is hastening to decay, and without repairs, to which the finances of Spain are inadequate, it will in a few years be a pile of ruins. Its beautiful apartments, its stately columns, and its lofty walls, will be mingled together, and no memorial be left in Spain of a people who once governed the Peninsula.

ALHANDAL, from *handal*, Arab. *coccyntos*, a term in the Arabian pharmacy, signifying colocynth—The trochisee alandal, are a kind of troches composed of colocynths, bdellium, and gum tragacanth. They were esteemed good purgatives, though not used at this time.

ALHAZEN, in biography, a learned Arabian, who lived in Spain about the close of the eleventh, or beginning of the twelfth century. His principal works are a treatise on astrology, and another on optics, printed in Latin in the *Thesaurus Opticæ* of Risner, in 1572. Alhazen supposed that the refraction of the atmosphere did not de-

pend upon its vapours, but upon its different transparency. In examining the effects of refraction, he endeavours to prove that it is so far from being the cause of the heavenly bodies appearing larger near the horizon, that it would make them appear less: two stars, he says, appearing nearer together in the horizon than near the meridian. This phenomenon he ranks among optical deceptions.

ALHEN, in natural history, a name by which Dr. Shaw, and others, have called a genus of plants, named by Linnaeus *Lawsonia inermis*.

ALHIDADA, or **ALIDADE**, Arab. a ruler, the index or label of an astronomical, or geometrical astrolabe for taking heights or distances.

ALHIRTO, in astronomy, a fixed star of the third magnitude, in the constellation Capricorn, otherwise called *rostrum gallinae*. Near this star, in 1600, appeared a new star, which continued visible twenty-one years, and then disappeared.

ALI, a sect among the Mahomedans, who adhere to the right of succession of Ali, and to the reform of Mussulmanism introduced by him. This sect is more particularly called Schiites; and stands opposed to the Sunnites, or sect of Omar, who adhere to the law as left by Mahomet, Abubeker, and Omar. After Mahomet's death, great disputes arose about the succession, and though many voted for Ali, Abubeker was preferred, and elected the first caliph. The Persians are the chief adherents to the sect of Ali, whom they hold to have been the legitimate successor of Mahomet, and Abubeker an usurper. On the contrary, the Turks are of the sect of Oimar; and hold Ali in execration. The distinguishing badge of the followers of Ali is a red turban, which is worn by the Persians, who are hence called in derision, by the Turks, Kilsibachi, i. e. red heads. See next article.

ALI, or **HALI**, the son of Abu Taleb, cousin-german and son-in-law of Mahomet, being married to his daughter Fatimah. He was the fourth caliph after him, as he did not succeed till after the death of Othman, in 1655, though he stood competitor with Abubeker, upon Mahomet's death, A. D. 632, which occasioned a civil war among the Mussulmans. He was murdered in the fifth year of his reign, and sixty-third of his age, A. D. 660, near Cafa, in Arabia Felix, by Muavias, the sixth caliph; who, to obtain that dignity, poisoned Ali's son and successor, Hacen, along with his brother Hassan, and eleven of Ali's grandsons, within six months after his death. It is worth remarking, that the four first successors of Mahomet, Abubeker, Omar, Othman, and Ali, whom he had employed during his life as his chief agents in establishing his religion, by extirpating unbelievers, and whom on that account he styled the 'cutting swords of God,' like the successors of Alexander, all died violent deaths; and that this bloody impostor's family, as well as that of the mad monarch of Macedonia, was nearly, if not totally, extirpated within thirty years after his death. When the prophet assembled his kinsmen, and declared his mission, he asked which among them would be his vizier: 'I am the man,' exclaimed the youthful Ali, then of the age of fourteen; 'whoever rises against thee, I will dash out his teeth, tear

out his eyes, break his legs, rip up his belly; O prophet, I will be thy vizier over them.' Ali kept his word; and famous both for his eloquence and valour, became one of the main pillars of the new faith, and obtained the name of the 'Lion of God, always victorious.' He is said to have been the author of several works, particularly one entitled *Centiloquium*, which is much esteemed among the Arabs and Persians; and part of which has been translated into English by M. Ockley. He also wrote an interpretation of the Alcoran.

ALI BEY, an eastern adventurer, whose history and exploits have excited considerable interest. He was probably born among the Abazans, a people inhabiting Mount Caucasus, and brought by the slave merchants to one of the annual sales at Cairo, where he was purchased by the brothers Isaac and Yousef, Jews, employed in the custom-house, and presented by them to Ibrahim, a *kiaya*, or veteran colonel of janissaries, and one of the most considerable men in Egypt. He is supposed to have been then twelve or fourteen years of age. By the favour of his patron, he was taught to read, write, and perform the customary military exercises, in which he displayed a fire and activity that obtained for him the appellation of *djendali*, or madman. At the age of eighteen or twenty his beard was allowed to grow, or he was made free; his patron gave him a wife and revenues, promoted him to the rank of *kachef*, or governor of a district, and procured him to be elected one of the twenty-four beys. His ambition was hereby excited; and the death of Ibrahim, in 1757, opened a way for the execution of his projects. After an absence of a few years, during which he had been engaged in various intrigues for raising and displacing several chiefs, and two years of which he had passed in a state of exile in Said, or Upper Egypt, devising his plans of future domination, he returned to Cairo in 1766; and in one night killed four beys, who were his enemies, banished four others, and from that time became chief of a numerous party. Not contented with the office of bey, he aspired to the sultanship of Egypt; determined to throw off the supremacy of the Porte, and accordingly expelled the pacha, refused the tribute, and in 1768 proceeded to coin money in his own name. The Porte, occupied by other concerns, was under a necessity of temporising; and Ali pushed forward his enterprises with success. He began with dispossessing Hammam, an Arab sheik, of a port of the Said, which he had occupied, and where he had formed a power capable of giving disturbance: and towards the end of this year, 1769, fitted out some vessels at Suez, which were ordered to seize on Djedda, the port of Mecca, whilst a body of cavalry marched by land to take possession of the city itself. The project which he had formed was, to make Europe abandon the passage to the East Indies by the Cape of Good Hope, and substitute the ancient route of the Mediterranean sea, and the Arabian gulf. Flushed with success, in the enterprises he had accomplished already, his ambition suggested to him more extensive conquests. Syria was the first object of his contemplation; and the war with the Russians, which broke out in 1769, and which occu-

pied all the Turkish forces in the north, favoured his design. Besides which, sheik Daher, in actual rebellion against the Porte, would be a powerful ally; and the extortions of the pacha of Damascus disposed those he had oppressed for revolt, and made way for his obtaining the title of the deliverer of nations. Ali having laid his plan, detached in 1770 a corps of Mamalukes, to take possession of Gaza, and thus to secure an entrance into Palestine; soon after he sent a larger army to form a junction with Daher at Acre, and to proceed thence to Damascus. Osman, the pacha of this place, was diligent in his preparations, and collected a numerous army. On the 6th of June 1771, a decisive action took place, in which Mahomet, the friend of Ali, and Daher his ally, proved victorious, and took possession of Damascus; but the castle resisted. At the moment when the signal of surrender was expected, Mahomet suddenly commanded a retreat, and all his cavalry turned towards Egypt. This singular revolution was at first attributed to a pretended report of the death of Ali Bey; but it was owing to a conference which had passed the preceding night between a crafty agent of Osman and Mahomet Bey, Ali's commander. Ali, though disappointed and chagrined, did not renounce his projects; he prepared, in conjunction with Daher, a second army for the campaign of 1772, but the event was unpropitious. The escape of Mahomet roused his jealousy and his fears; he beheld in him a dangerous rival, and resolved on his ruin. Having ordered the gates of Cairo to be shut, and no Mamaluke to be allowed to pass, he sentenced Mahomet into immediate exile in the Said. Mahomet, however, contrived to make his escape; and from this moment all was lost; for the Mamalukes, wearied with the insolence of Ali Bey, repaired in crowds to his rival, so that in about six weeks he left the Said with a strong force, and marched towards Cairo. Ali, however, prepared to meet him; and in the month of April 1772 the two armies had a rencontre in the plains of El-Masateb, at the gates of Cairo; the issue of which was, that Mahomet and his party entered the city, sabre in hand; and Ali Bey had barely time to escape with 800 of his Mamalukes. With this inconsiderable force he repaired to Gaza, and attempted to join his ally, Daher, at Acre, who, after some danger from which he was rescued, conducted him to the city. Both Ali and Daher marched to the succour of Said, (Sidon,) which was then besieged by the troops of Osman, in conjunction with the Druzes. At their approach the Turks raised the siege, and retired to a place about a league north of the city, on the river Aoula. There, in July 1772, an engagement took place; and the Turkish army, three times more numerous than that of the two allies, was entirely defeated. The seven pachas, who commanded it, fled; and Said remained in the possession of Daher. Ali Bey and Daher, on their return to Acre, proceeded to chastise the inhabitants of Yafa, or Jaffa, who had revolted; and, after a siege of eight months, the town capitulated in February 1773. Ali now determined to return to Cairo; and he was encouraged in his purpose by the promised succours of Daher, and of the Russians. This

assistance was delayed, and Ali became impatient. In April 1773, quickened in the execution of his purpose by fabricated letters which he received from Cairo, he began his march at the head of his Mamalukes, and some troops furnished by Daher; but when he advanced into the desert, which separates Gaza from Egypt, he fell into an ambush of 1000 Mamalukes, commanded by Mourad, a young bey, who, being enamoured of the wife of Ali Bey, had obtained a promise of her from Mahomet, in case he should bring him the head of Ali. The attack was impetuous; Mourad met with Ali in the crowd, wounded him in the forehead, made him prisoner, and conducted him to Mahomet. By his former master, Ali was received with perfidious respect; but on the third day this parade of civility and politeness terminated by the death of Ali Bey, who, according to some, died of his wounds; or, as others report, by poison.

Ali Bey was a character of original vigour and capacity; and was superior in his views to what could have been expected from one who was bred in barbarism and ignorance—he governed Egypt with a steady hand, and was particularly favourable to the Franks. But he undertook more than he had power or talents to perform; and by this means exhausted his revenues in fruitless enterprises. He is also blamed for resigning active labours to his lieutenants, replacing unlimited confidence in his favourites, and winking at the exactions of his officers. His morals were those of his country, where perfidy and murder are the only means of pursuing the objects of ambition; yet he was not devoid of generosity. During his administration, several nests of robbers in Egypt were annihilated; villages which had been inhabited by the pirates of the Nile were razed; the communication between different parts of the country was free; the roads were no longer infested with robbers, nor was navigation interrupted by that spirit of pillage, which, since his death, has resumed its fatal activity. It was his wish that every man might be able to carry his purse in his hand, and leave his door open, without running any risk.

ALI PACHA, of Janina and vizier of Epirus. He rose, as we have seen already, (article ALBANIA,) from a comparatively obscure birth; but the genius and energy of his mother gave a very remarkable and successful impulse to his early life. In the strength, as well as implacability, of her character, she appeared worthy to be the parent of such a son. 'To my mother,' said he one day to the consul general of France, M. Pouqueville, 'I owe all; for my father, on his death bed, left me but a mere hole, and a few fields. My imagination, fixed by the counsels of her who has twice given me existence, for she has made me a *man* and a *vizier*, revealed to me the secret of my destiny. From that moment I only considered Tepelini as the natal aerie from which I was to dart upon the prey already mine in idea. From that moment I thought but of power, treasure, and palaces—in fact, of all which time itself has realized, and which it still promises.' Khamco, in fact, herself the daughter of the Bey of Konitz, and

favourite wife of Ali's father, believed our hero to be destined to restore the honours of his family. 'My son,' she would frequently say to him, 'he who does not defend his inheritance deserves to be deprived of it. Recollect that the property of others only belongs to them by the right of the stronger. Why then should it not be yours?'—and Ali was, through life, but too obedient to this advice. The indignity she endured from the Gardikotes, was, it must be admitted, cruel to the last degree; being carried off by surprise from Tepelini, the family inheritance, with her daughter Chainitsa, then in the flower of youth. She was imprisoned in a dungeon, and brought out daily to endure the brutal embraces of the principal inhabitants; an injury remembered for forty years by Ali and his sister. The vizier himself declared, that after being reduced, some time after this circumstance, to the necessity of selling his sabre to procure bread, his fortunes were suddenly altered by the circumstance of discovering a chest full of gold, in the ruins of an old monastery; with which money he raised two thousand men, and entered Tepelini in triumph. He now took one of his characteristic methods of making himself absolute master of his native town. Having personal enemies whom he wished to cut off, he secretly fermented amongst them a conspiracy against himself; and left on a certain day his riding cloak in a wood, where he occasionally hunted and slept, covering a goat. The conspirators, as previously arranged, came and fired through his mantle, exclaiming in triumph as they returned, 'Veli bey, is no more.' In the evening he attacked their houses, crying out in return, 'Mine is the cause of justice,' and put the whole party to the sword.

We have noticed his attack and overthrow of the neighbouring pachas of Berat and Delvino; the latter was, according to his own acknowledgement, a distinguished benefactor of Ali's. He possessed a territory which had long been a matter of dispute between the Porte and the Venetians; and having sold to the latter a forest near the lake Pelode, Ali caused it to be secretly represented at Constantinople, that the Pacha of Delvino had alienated a portion of the Sultan's territory. On this, the Divan, as he had calculated, despatched a firman to Ali, for that chieftain's death. He went to Delvino, was received by the old Pacha with his accustomed kindness, and lodged in the seraglio. Every morning he waited upon his host to pay him the customary compliments. One day feigning indisposition, Ali requested Selim would come into his apartment for the purpose of receiving an important communication. The invitation being accepted, scarcely had the unfortunate old man entered the room, than the assassins, who had been concealed in a closet, upon a signal being given, rushed out, and stabbed him to the heart; he fell, pierced with wounds, uttering almost the same words as Cæsar, 'Is it thou, my son, who deprivest me of life?' At the noise of the tumult, his guard hastened to the spot, and found Ali in the midst of the assassins, with the firman in his hand, exclaiming in threatening accents, 'I have killed the traitor by order of our

glorious sultan! here is his imperial mandate. Ali's contests with the Suliotes, developed in the latter many of the noblest qualities of the ancient Greeks. At the commencement of their first war with him, they possessed sixty-six independent villages, and an army of 1400 experienced soldiers. The whole of this valiant Christian republic he managed, after several years of cruelty and treachery, to disperse or destroy. Their ill-deserved fate found commiseration within the walls of his own seraglio. Emineh, his favourite wife, and mother of his two sons, Mouctar and Veli, fell at his feet to implore his clemency for them, asserting that the tutelar genius of his fortunes had warned her in a dream to spare the Suliotes. 'The Suliotes, the most inveterate—the most implacable of my enemies,' exclaimed the vizier in a voice of thunder, and drawing a pistol from his girdle, discharged it at the suppliant, who, though not wounded, it is said, died with fright. His cruelties to the weaker sex 'stain him' indeed 'with disgrace.' His son, Mouctar, having become enamoured of the wife of a principal citizen of Janina, Ali did not disdain to take up the quarrel of his daughter-in-law, who detected a jewel in the possession of the beautiful Phrosina, which she had given to her husband. He swore by the beard of Mahomet, that he would obtain for her ample vengeance; and repaired himself by night to the residence of the frail fair one. With the lamp in his hand, he entered her bed-room, awoke her, exhibited the ring, and commanded her to rise and follow him. Having arrived in the court-yard, he directed his guards to conduct her into a Greek church, on the borders of the lake, and afterwards sent thither twenty of the vilest women of the place as her companions. The next evening the whole were taken out upon the water in a boat, and each being in succession sown up in a sack, was precipitated into the waves.

After the reduction of the Suliotes, Ali found himself in the midst of new enemies, having refused, on the destruction of that republic, to withdraw his troops from the district of Tramouria; the beys in authority there resented his conduct, and refused to pay into his hands those maritime duties of the coast which he had farmed from the Porte. They solicited, and received, considerable aid from the Russians, who further augmented Ali's jealousy against them, in 1805, by becoming masters of Montenegro, on the north of Albania. In this war with the beys, Ali subdued and pillaged above forty towns and villages. The progress of the French arms in Dalmatia was by no means pleasing to him, and first induced him to open that active correspondence with the court of St. James, which, through Lord Nelson, Lord Collingwood, and Major Leake successively, was kept up for many years. All the events of the French revolution were familiar to this Napoleon of the east; nor did Buonaparte overlook the importance of Ali's political situation. In the latter end of 1805, M. Pouqueville, to whom we are indebted for many anecdotes of this despot, was nominated consul-general of France at Janina. He thus describes his first audience with the vizier:

'After the usual compliments, the private

dragoman of the vizier was called, in order to commence the conversation, which the Pacha began by asking questions with a volubility very uncommon among the Turks. Through the shade (for the hall of audience was only illuminated by the flitting and uncertain light of a yellow bougie), I perceived the coruscations of his penetrating eyes, and observed the convulsive motions of his features; I listened to his conversation, apparently vague and unconnected, yet full of cunning and duplicity. Swinging himself about, continually laughing and talking, not a word escaped him but had its import, notwithstanding the rapidity of his utterance; he at times threw scrutinizing glances on me, and at length ordered his Greek secretary, and his minister, who was dressed in black and wore a long white beard, to retire. We remained with the interpreter, who continued to stammer out the questions and answers, till after a conversation of about two hours, we withdrew, leaving the vizier struggling between hopes and fears.—This interview sufficed to dissipate some of the illusions which I had been under: Ali Pacha was neither a new Theseus, nor the modern Pyrrhus of Epirus. I was disgusted with his manners, and secretly deplored my fate in being compelled to reside near and be in communication with a man of such a character.'

After the battle of Austerlitz, our wily Greek found his account in flattering the French usurper; and, is said, through the interest of the latter at Constantinople to have obtained the pachaship of Lepanta for his son Mouctar; and that of the Morea for his second son Veli. The French government, in 1807, gratified him highly by supplying him with a detachment of artillery men, and ordering colonel Vaudoncourt to remain in his dominions, for the purpose of improving the military tactics of his army. Ali, during the war that now ensued between France and Russia, was keeping a watchful eye on the Ionian isles, with the hope of adding them to his other conquests. He sent envoys to London, to Malta, Sicily, and, it is said, even to Tilsit, in the hope of accomplishing, by negociation, this favourite object; but the islands were seized by France, and Ali now again returned to his friendly relation with England. He is said to have considerably influenced the signing of a peace at this time between England and Turkey. It was at this period, 1809, that he finally subdued his rival, Ibrahim, the pacha of Berat, and cajoled the divan to bestow the vacant pachaship on his son Mouctar. He finally imprisoned the feeble vizier, Ibrahim, and constructed for him a dungeon under the great stair-case of his palace, that he might have the satisfaction of walking daily, as he said, 'over the head of his enemy.' A stratagem of Ali's, with regard to this fallen foe, marks the character of his mind and actions very strikingly. Being informed that reports of his various cruelties were becoming rather too serious at Constantinople, he suddenly withdrew Ibrahim from his prison, and concealed the place of his residence from his daughters, who had followed him into captivity. They now therefore naturally concluded that he had been put to death. Janina resounded

with their insinuations and complaints, and the French consul despatched the tidings to Constantinople. On this, a capidgi-baschi was ordered to proceed to Janina, and make a report respecting the conduct of Ali to Ibrahim. The former received him in the presence of all his ministers, and on the firman of the grand seignior and the nature of his mission being announced, Ali, with a tone of indignant surprise, exclaimed, 'Dead!—my father Ibrahim dead!' Then turning to his ministers, Mahomet and Sechri-effendi, 'Go,' said he, 'and accompany this officer into Ibrahim's apartment, that he may be convinced of the vile calumnies which are propagated against me.' These officers found Ibrahim in the handsomest apartment of the seraglio, and well instructed for their reception. He prayed the capidgi-baschi to assure the sultan, his master, that he kissed the earth on which he placed his sacred feet, and while he felt with the deepest gratitude the interest which his highness took in his welfare, being now too old to support the cares of government, he could not be happier than for himself and his possessions to be in the hands of his dearest friend, the vizier of Janina. Our limits will not allow us to add many other characteristic anecdotes of this most accomplished and most scocious tyrant of modern times; but they abound in the writings or allusions of Lord Byron, Mr. Hobhouse, Dr. Holland, and Mr. Hughes.

From his alliance with England, Ali obtained one object of his ambition, little to the credit, as we humbly opine, of British diplomacy—the possession of Parga. Ali had strenuously endeavoured in 1814, to seize upon this devoted rock, the only spot along the whole extent of his coast which could now boast of any independence; but though 5000 of his bravest and most experienced troops surrounded the place, and succeeded at one time in entering the lower town they were repulsed by the Parganiotes; and the place well provisioned, but garrisoned principally by seventy French grenadiers, frowned defiance upon him. When Ali first received the news of this repulse of his troops, he was returning into his capital from Preveza, accompanied with the English resident, and is described as becoming in a moment frantic with rage. 'What!' cried he, 'Parga defended only by sixty Frenchmen, and victorious!—then would he roll himself on his sofa, alternately 'crying like a child, and roaring like a wild beast.' The brave Parganiotes ultimately prevailed upon the British authorities in the neighbourhood to seize Parga by a coup de main. Ali, in the cession of this island, reigned with terrible and undisputed sway over a larger country than Pyrrhus, or even than Alexander himself had done before his conquests in Asia Minor. He was master in fact of all continental Greece, from the frontiers of Attica to the mountains of Illyria.

But he himself, on one occasion, ably defined his station: 'A vizier,' he said, 'is a man covered with honours, and seated on a barrel of gunpowder, which may be blown up with a spark.' The Porte became well acquainted with the great extent of his treasures, and anticipated their possible division amongst his children, in

case he died a natural death. Pacha Bey, an ejected minister, or selector of his son Veli, had incurred the implacable hatred of Ali; who, fleeing from Ali's frequent attempts to procure his assassination in Greece, had met at Constantinople with Demetrius Paleopulo, an Etolian, and these two chieftains together drew up a memorial to the divan, on the subject of Ali's extensive possessions and barbarous tyranny. Pacha Bey, after a long attendance upon the sultan, became one of his cupidgi-bachi or chamberlains, and in this situation Ali Bey had the hardihood to attempt taking him off, by means of two assassins. They procured admission to the residence of this enemy, but having only slightly wounded him, endeavoured to escape. Being pursued and put to torture, they confessed that they were hired by Ali Pacha to assassinate Pacha Bey. The assassin was hung in front of the imperial seraglio, and the sentence, firmly or imperially proscribed, was shortly after pronounced against the pacha of Janina. Its tenor was, that Ali Pacha, accused of high treason, and having at different periods received pardon of his delinquencies and felonies, should be placed under the ban of the empire, as a relapse, if he did not present himself within forty days at the golden threshold of the gate of felicity, to plead in justification; and the grand seignior, having put all his agents and couriers into irons, declared that whosoever should dare to speak to him in favour of Ali should lose his head.

New governors were at first placed in all the military positions bordering upon Albania; then the neighbouring pachalics of Scodra, Tbrace, &c. were ordered to assemble their forces, and the command of the entire expedition against the rebel vizier was committed to Pacha Bey, now denominated Pacha of Janina and Dervino, by the right of arpalich or conquest. The old lion, as Ali was frequently called, aroused himself with an energy worthy his warlike character.—He first applied for the interposition of the English with the Porte, but failing in this, he purchased largely of them arms and military stores. He re-organized the armatolis, and paid great court to the Greeks; but on the first appearance of his rival in the neighbourhood, a considerable body of the former revolted, and before a blow was struck, Ali lost Cisaxian, Macedonia, and Thessaly, to the defile of Gomphiy. His son Veli, on the appearance of the enemy in that direction, abandoned Lepanto, removed by sea all his valuable property to Preveza, and retired himself to Janina, whither his brother Mouctar repaired about the same time. Though Ali was, on his appearance in public, every where received with acclamations, he now began to find that no reliance could be placed on the greater part of his troops. The whole of higher Albania fell away from him; and though for a time his enemies were dilatory, and a Turkish fleet, which appeared upon the coasts, at first retired without effecting any object, Pacha Bey gradually advanced in sight of Janina, without fighting a single battle. Ali's long meditated plan of final defence was this, to destroy the town of Janina, and shut himself up within his vast fortress, situated on the isle of a neighbouring lake. There were remaining to

him about 8000 faithful troops. With these he garrisoned his three well-constructed castles on the isle, whose walls were protected by 250 pieces of cannon. When the inhabitants of Janina saw the despot retiring with all his treasure into the fortress, they began to embark their property and families upon the lake with a view to escape the coming conflict. Ali, on the other hand, made no scruple of giving up his capital to be pillaged by the soldiery; and Pacha Bey, on the 19th of August, marched into its still smoking ruins, through the gate of Paralepti. Ali's garrison was provisioned for more than four years, and had ample supplies of ammunition and warlike stores; neither could water ever be wanting as the castle was situated in the midst of a lake. As the crisis of his fate approached, Ali appeared to summon all his energies to overcome it: even his physical strength seemed to be renewed, and to triumph over the weight of his years. He was seen at all hours, and in all places—now on horseback, now in his palanquin; and sometimes seated on a bastion, in conversation with the workmen and common soldiers, whom he daily inspected. In the autumn, supposing that some of his troops might be discontented with the confined and arduous service in which they were engaged, he selected 1500 for a sortie: and, giving them their full pay, opened his gates and sent them forth. As he expected, when they arrived in sight of the Turkish camp, they saluted his enemy, as 'Vali' and 'Gazi.' In September, the besiegers began to murmur at their new chief, who, finding no present hope of reducing Ali to submission by military manœuvres, had recourse to a negotiation with his sons. These terminated in the surrender of both Previsa and Berat, of which, when Ali was informed, he only observed, 'that he had long considered his sons unworthy of their race; and that henceforward his now dependent soldiers are his only children.' Gradually his magnificent palace became only a well-defended camp: his harem was attacked almost universally with scurvy and fever; and a gradual waste of his own fine form and complexion evidently appeared. He slept little, and could not trust his person but to the watchfulness of two individuals, Athanasi Vai, on whose knees he slept; while Ibrahim Saretil, his former postmaster, kept watch at the door of his apartment.

The siege proceeded slowly, and more than 5000 bombs had been thrown against the castle of Ali without effect. The sultan was at last weary of these ineffectual efforts to subdue a single rebel, and Ismael Pacha was superseded in command by Churchid Mahomet Pacha, who after various minor intrigues, induced our Pacha to open a communication with him in December, on the terms of receiving a pardon and his life, for relinquishing his fortress and his treasures. One characteristic fact Ali had taken care to communicate to the new commander, viz. that he kept in his magazine, night and day, a Turk named Selim, at all times willing to sacrifice his life and who was always provided with a lighted match, for the purpose of blowing up 200,000 barrels of gun-powder. Churchid at last entrapped the wily Ali, by an artifice similar to

what this despot had often practised. He sent word by a flag of truce that at length the sultan had listened to his frequent representations, and granted Ali a pardon; but it was necessary that he should repair to the Turkish camp, and confer with Churchid in person. Ali was duped into compliance with this; and with about a dozen officers repaired to the camp of Churchid. Here a magnificent tent was prepared for his reception, and all things appeared fair and promising. On the morning of the 5th of February, Churchid sent a message to Ali Pacha, that the pardon had at length arrived, and proposed that as a token of gratitude, Ali should direct his faithful Selim to give up his lighted match. He was doubtful, but, cajoled; drew forth the half of a ring; on sight of which Selim prostrated himself, extinguished his match, and was instantly poniarded.

It was now five o'clock, P. M. and Ali being seated at the door which led to the conference chamber, the apartment was suddenly entered by Hassan Pacha, Omer Bey Brioni, the scelitar of Churchid Pacha, and several other officers of the Turkish army. Ali arose with all the energy of his youth, and grasping one of his pistols, exclaimed, 'Stop! What is it you bring me?' 'The firman of his highness: know you not his sacred characters?' (shewing him the signature).—'Yes, and I revere them.'—'If so,' said Hassan, 'submit to your fate, perform your ablutions, and make your prayer to God and to the prophet: your head is demanded.' Ali would not permit him to conclude: 'My head,' replied he furiously, 'is not to be delivered up so easily:' and fired his pistol, by which Hassan's thigh was broken. With the rapidity of lightning Ali drew forth his other pistols, and shot two more of his adversaries dead upon the spot. Already had he levelled his blunderbuss loaded with slugs, when the Scelitar, in the midst of the affray, (for Ali's adherents defended their master with the utmost fury,) shot him in the abdomen. Another ball struck him in the breast, and he fell, crying out in the struggle of death to one of his sciaires, 'Go, my friend, despatch poor Vasiliki, that these dogs may not profane her beauteous form.' Thus died as he lived this extraordinary and bloody despot: deceived to his undoing, and desperate when he found himself in the toils, because, in fact, he was without principles to teach him either patience or courage.

ALIA, in antiquity, solemn games, celebrated by the Rhodians on the twenty-fourth day of the month *Gorpiaæ*, answering to the month *Bædrominus*, or the third of the Athenian year, in honour of the sun, *αλιος* or *ηλιος*, said to have been born in Rhodes, the inhabitants of which were reputed his posterity, and therefore called Heliades. Boys as well as men engaged at these games, and the victor received a crown of poplar.

ALIACMON, or HALIACMON, a river of Macedonia flowing into the Ægean sea, to which Claudian gives the epithet of *rapidus*. It is now called *Polecas*.

ALJAMEIA, the name which the Moriscoes in Spain gave to the language of the Spaniards.—

Among other articles agreed upon by the Junto, which was appointed by the emperor Charles V. in 1526, in favour of the Moriscoes, this was one, that the Moriscoes should no longer speak Algavaria, i. e. Moorish or Arabic; but should all speak Spanish or Aljameia, as it was called by the Moors, and all their writing and contracts should be in that language.

ALIAMET, (J.) a celebrated French engraver, and a member of the academy of Painting, was born at Abbeville in 1728. His best works are representations of battles between the Chinese and Tartars. He died in 1788, at Paris.

ALIAS. Lat. otherwise. Often used in the trial of criminals after one name and before another, to signify that they have more than one appellation; as, John *alias* Thomas.

What nation formerly knew not the acts of Englishmen better than themselves? otherwise, Polydore Virgil had not undertook, to our shame and prejudice, the English chronology: nor Verstegan, *alias* Rowly, the confidence to render well nigh all the considerable gentry of this land, from the etymology of their names, Teutonicks.

Sir T. Herbert's Travels, p. 396.

If the sheriff cannot find the defendant upon the first writ of *capias*, there issues out an *alias* writ.

Blackstone.

ALIAS, in law, a second writ issued from the king's courts at Westminster—a *latitat*, *capias*, or *quo minus*, having been issued without effect.

ALIAS DICTUS, in law, the manner of describing a defendant when sued on a bond or other speciality. After the name, &c. comes the alias dictus, which describes him by the exact name and addition whereby he is bound in the bond or speciality in question.

ALIBANTES, from *ἀλιβάντες*, a Greek name for those who, on account of poverty, could not procure burial.

ALIBI, in law, denotes the absence of the accused from the place where he is charged with having committed a crime; or his being elsewhere, as the word imports, at the time specified.

ALICA, a sort of frumenty, a nourishing farinaceous food. It is also used for a kind of wheat, *χωρέπος*, which was used as a medicine.

ALICANT, a rich and strong sea-port town of Spain, in the province of Valencia, and territory of Segura. It is seated between the mountains and the sea, and has a castle that was long reckoned impregnable. The port is defended by three bastions, furnished with artillery, and has watch-towers to give notice of an enemy's ship. It was taken from the Moors in 1264. The castle was taken by the English in 1706, and held out a siege of two years before it was retaken by the French and Spaniards; but at last surrendered upon honourable terms, after part of the rock was blown up on which the castle stood, and the governor killed. The houses are high, and well built; and a very great trade is carried on in it, particularly in wine and fruit. The English, Italians, &c. have consuls in it. It is seated on the Mediterranean, on a bay of the same name, thirty-seven miles north-east of Murcia, and seventy-five miles south of Valencia. Lon. 9°. 36'. W. lat. 38°. 35'. N.

ALICANT WINE, in pharmacy, a cordial which has the agreeable colour of red wine added to the mildness of a wine made of must; and it is generally allowed that it is prepared in that manner. It is evident that the must which produces it has been coloured before fermentation.

ALICATA, a mountain of Sicily, near the valleys Mazara and Noto, upon which was situated, as is generally thought, the famous Dædalion, where the tyrant Phalaris kept his brazen bull.

ALICATA, anciently called Leocata, a town of Sicily, remarkable for corn and good wine, seated on a sort of peninsula near the sea, eighteen miles east-south-east of Girgenti. It was plundered by the Turks in 1543. Alicata contains 10,000 inhabitants. The populace pay uncommon reverence to the sacerdotal character; the women and children falling on their knees in the streets before a clergyman, touching his garments with a finger, and then kissing their hands with great veneration. Alicata is said to possess some ancient Greek manuscripts relating to the ancient city of Gale: the most remarkable is a psephisima, or decree of the senate for crowning Heraclides, director of the public academy. Lon. 13°. 50'. E. Lat. 37°. 11'. N.

ALICATA CHLAMYS, was a sort of vest with sleeves worn by the Roman boys to the age of thirteen, when they put on the praetexta.

ALICATICA, an Arabian weight.

ALICES, in medicine, spots preceding the pustules of small pox.

ALICONDA, in botany, an African tree, growing naturally in the kingdom of Congo, of such bulk that ten men cannot fathom it round. The natives call it bondo; and they do not build their huts near it, lest its fall should crush them to death, as the wood easily rots, or its fruit, which is of the size of a large gourd and easily broken from the tree, should knock them down. The bark of this tree well beaten and macerated, yields a coarse thread, of which they make their ropes; and which, when macerated and dried, and beaten with bars of iron or wood, becomes like a large piece of cloth, with which the natives cover their middle from the girdle to the knees. The shell or rind of the fruit, which is hard like that of a gourd or calabash, being freed from its pulp, which may be made into a nourishing pap, serves for vessels of various kinds, and gives an aromatic taste to water preserved in it. The small leaves are eaten in time of scarcity, and the large ones serve to cover houses, or being burned make good soap.

ALICUDA, or **ALICUR**, one of the Lipari islands, near the coast of Sicily. This island is about six miles in circumference; but its population is not so great as that of Felicunda, which consists of about 650 inhabitants; the houses are built about half way up on the declivities of the mountains, in order that their inhabitants may guard themselves against the nightly attacks of the Tunisian Corsairs. In these two islands a considerable quantity of good wine is made; besides which they have Indian figs and olive-trees. The corn grown here is wheat and barley; which, together with the grapes, amount in value of produce to about

3000 Neapolitan crowns. The inhabitants of this island are extremely industrious, and cultivate the ground to the utmost extent; though the soil is greatly interrupted by points of rocks, masses of lava, clefts and crags. Three or four fishing-boats belong to this island, which are nearly all the property of the parish priests, and are used for the purpose of increasing their small revenues, amounting to little more than twelve sequins. There is not a spring of fresh water on either this or the neighbouring island, and therefore when there is a long continuance of dry weather, the distress of the inhabitants is extreme. Their food consists of black barley-bread and wild fruits, and sometimes by way of dainty, salt fish; and their houses, or rather huts, which appear like the nests of birds hung to the cliffs, are formed of pieces of lava, and scarcely admit a ray of light; yet they are uncommonly contented and happy, owing to the salubrity of the air and the temperature of the climate they enjoy. By the vestiges of fire which are discernable in every part of this island, it has been supposed that Felicunda and Alicuda had once formed a single conical mountain; and yet, though these islands shew so indubitably that they have been the seats of volcanic eruptions, there is at present no appearance of fire; nor do the most ancient writers mention any conflagrations in either of these islands. The ancient name of Alicuda was Ericusa; and the author of the epitome of Stephanus says that it was so named from the erica, or heath, which grows there in such abundance. Lon. 14°. 3'. E. Lat. 38°. 31'. N.

ALICULA, in antiquity, a kind of puerile habit worn by the Roman children. It was a sort of chlamys or tunica manicata.

ALICUN, a town of Spain, in the province of Granada, celebrated for its medicinal waters. It is twelve miles from the city of Granada.

ALJEMBUT, or, as some write it, gembut, a name given by Avicenna, and others, to a species of acacia, also called the Nabathæan pod, and ceration, or siliqua, and which some have supposed to be the same with the common carab; but they expressly distinguish it, by saying that it is an astringent, whereas the other is gently purgative, and that the fruit of it was given in hemorrhages. Isidore says, that the acacia juice of the shops was made of its fruit, while unripe.

A'LIEN, *v. n. & adj.* Lat. *alienus, aliis*:
A'LIENABLE, } to make any thing the
A'LIENATE, *v. n. & adj.* } property of another;
ALIENA'TION, } to transfer good-will,
ALIENA'TOR, } friendship, or affection.—An alien, formerly alyaut, is one from another country, a foreigner.

Gyf that thou sekiis ane *alienare vnknow,*
To be thy maich or thy gud sone in lawe.

Douglas, b. vii. p. 219.

Symound, what seemith to thee? kyngis of crthe
of whom taken thei tribute, of her sones either of
aliens? And he seide, of aliens.

Wyclif. Matthew, chap. xvii.

An **alien** is one, born in a strange country, and never enfranchised. A man, born out of the land, so it be within the limits beyond the seas, or of English parents out of the king's obedience, so the parents (at the time of the birth) be of the king's

obedience, is not *alien*: if one, born out of the king's allegiance, come and dwell in England, his children (if he beget any here) are not *aliens*, but denizens.

Cowell.

The countries of the Turks were once Christian, and members of the church, and where the golden candlesticks did stand; though now they be utterly alienated, and no Christians left. *Bacon.*

If the son *alien* lands, and then repurchase them again in fee; the rules of descents are to be observed, as if he were the original purchaser.

Hale's History of Common Law.

Land is *alienable*, and treasure is transitory; and both must pass from him, by his own voluntary act, or by the violence of others, or at least by fate.

Dennis's Letters.

In whomsoever these things are, the church doth acknowledge them for her children: them only she holdeth for *aliens* and strangers, in whom these things are not found. *Hooker.*

If it be proved against an *alien*,

He seeks the life of any citizen;

The party, 'gainst the which he doth contrive,
Shall seize on half his goods.

Shak. Merch. of Ven.

The more Irish were not only accounted *aliens*, but enemies; so as it was no capital offence, to kill them.

Sir John Davies on Ireland.

Be it never so true, which we teach the world to believe; yet, if once their affections begin to be alienated, a small thing persuadeth them to change their opinions. *Hooker.*

His eyes survey'd the dark idolatries

Of alienated Judah. *Milton's Par. Lost.*

The mother plant admires the leaves unknown
Of alien trees, and apples not her own. *Dryden.*

From native soil

Exil'd by fate, torn from the tender embrace

Of his young guiltless progeny, he seeks

Inglorious shelter in an *alien* land. *Philip.*

God put it into the heart of one of our princes, to give a check to sacrilege. Her successour passed a law, which prevented all future alienations of the church revenues. *Atterbury.*

Great changes and *alienations* of property have created new and great dependencies.

Swift on Athens and Rome.

ALIEN, in law, from the Latin *alius*, 'another,' q. d. a person born out of the king's dominions. Thus there are alien friends, viz. persons born in countries in alliance with the state, and alien enemies; by which name are designated those born in countries considered by the state as hostile; children born of English parents, though under temporary subjection, or allegiance to a foreign power, are not considered as aliens in the eye of the law; nor children born of English parents on the high seas; nor children of English ambassadors at foreign courts. But British parents who have been guilty of felony or high treason, make their children aliens, who are born abroad. See the 25 Edward III. 7 Anne, c. 5. 10 Anne, c. 5, &c. The last two mentioned acts, however, with 4 Geo. II. c. 21, and 13 Geo. III. c. 21, render all children born out of the king's allegiance, whose grandfathers, by the father's side, or whose fathers were natural-born subjects, entitled to the civil rights of natural-born subjects. Such grandchildren, however, must, to claim the privilege of exemption from the alien duty, be protestants, and resident within the realm; and the claim to any estate or interest must be made

within five years. The issue of an English woman by an alien, born abroad, is an alien.

Having thus described what, according to the law of England, is termed an alien, we shall briefly enumerate the most common civil and political disadvantages to which he is subject, with an account of the most recent statutes, expressly bearing upon this particular.

An alien cannot vote at the election of members of parliament, nor can he enjoy any office, or be returned on any jury, unless where an alien is party in a cause when the inquest is composed of an equal number of denizens and aliens. An alien cannot purchase lands for his own use: nor can an alien female be endowed with lands, although she become the wife of a natural-born subject; nor a Jewess the wife of a naturalized Jew. However, an alien may acquire any kind of personal property; and he may bring or defend any action or process at law, for the protection of it, and may dispose of such property, by deed, will, or otherwise; his children born in the realm are generally to be held natural-born subjects. Aliens also may take leases of lands, and estates in trust; but these rights of aliens must be understood as of alien friends only; alien enemies having no rights at all, and no privileges, unless by the king's especial favour.

An alien may, by letters patent, ex donatione regis, be made an English subject, and is then called a denizen, being in a middle state between a natural-born subject and an alien. He may now purchase lands, or possess them by devise, but cannot inherit them, although his heirs may inherit from him; the parent of the denizen being held to have had no inheritable blood, which the denizen possesses after becoming so. See **DENIZEN**. He is still, however, subject to the alien duty, and there is no method of giving him the full personal rights of a natural-born subject, but by act of parliament. Even after naturalization, an alien cannot become a member of the House of Commons, or Privy Council, or hold offices or grants under the crown; and by stat. 12 William III. c. 2, and 1 Geo. I. c. 4, every bill for the naturalization of particular persons shall contain the proper disqualifying clauses. See **NATURALIZATION**.

After the commencement of the French revolution, our legislature judged it necessary to make the laws respecting aliens still more strict. Accordingly an act was passed in the 33 Geo. III. entitled, 'an act for establishing regulations respecting aliens arriving in this kingdom, or resident therein, in certain cases'; of which the following are the principle heads: 1. Masters of vessels must give in to the officer of customs at the port of arrival a written declaration specifying the names, &c. of the foreigners on board. 2. Aliens, arriving after the 10th of January, 1793, must give to the port officer of customs a written declaration of their names, rank, &c. Upon neglecting this, to be adjudged to depart out of the realm, and upon non-compliance to be transported for life. 3. They are to receive from the officer a certificate of their declarations. 4. Arms, attempted to be imported by aliens except as merchandise, are to be

seized. 5. If his majesty in council shall direct that aliens of any description shall not be landed, or only at prescribed places, masters offending are not only liable to a penalty but to forfeit their vessels. 6. No aliens are allowed to depart from the place of their arrival, (except for purposes specified) without a passport. 7. Aliens, (except domestic servants of natural-born subjects, &c.) arrived since the 1st of January, 1792, or arriving during the continuance of the act, desirous to remove; must obtain a passport from a magistrate. 8. Magistrates are authorized to grant passports to all parts of the kingdom, and also to require of an alien an exhibition of his passport, and in certain cases to detain him, till his majesty's commands may be received; and to commit him to prison, if his majesty shall not direct him to be discharged or to depart the realm. 9. Aliens who do not depart the realm, when ordered by his majesty's proclamation, are also to be imprisoned. 10. The secretary of state may grant warrants to conduct out of the kingdom, aliens, who will not obey proclamations, &c. The king may order any alien, arrived since the 1st of January, 1792, or arriving during the continuance of the act, to reside in such districts as he shall think proper. 11. Aliens in the kingdom on the 10th of January, 1793, or who arrived since the 1st of January, 1792, or arriving after the 10th of January, 1793, must deliver an account of their names, &c. and magistrates may require such accounts, and commit to jail those who neglect or refuse them. 12. They may also summon aliens suspected of not having delivered such accounts, and may arrest them for non-compliance. 13. They may require from house-keepers an account of the names, &c. of aliens, residing with them. 14. Justices of the court at Westminster, &c. may admit aliens to bail; as well as any other justices by authority of the secretary of state. 15. Aliens, within the times specified, must give an account of all weapons, &c. in their possession, and deliver them up to a magistrate, who may require them to do so. 16. The secretary of state may grant warrants to search the houses of aliens, for weapons, &c. and may require an account of such weapons from the house-keepers where aliens lodge. 17. His majesty may send out of the realm any alien, committed to jail, and if afterwards found in the kingdom he shall be transported for life. 18. Aliens thus adjudged to be transported, to be sent to such places as the king in council shall appoint: 19. and to suffer death if afterwards found within the realm. 20. Certificates are to be given gratis, and fresh passports may be granted for lost ones; but heavy penalties are awarded on those who forge them. 21. In questions respecting offences against this act, the proof lies on the party accused; and parties appealing must give six days notice. 22. The act does not extend to foreign ambassadors, aliens under fourteen years of age, or mariners certified by ship-masters to the officers of customs. Trespasses against this act, subjected the offenders to a variety of heavy penalties, specified in the act.

The acts 33 Geo. III. and 34 Geo. III. arose out of the influx of strangers to this country.

from the continent, and have been from time to time amended, and continued as in 43 Geo. III. c. 155, &c. They have generally been supposed to be applicable only to a state of ~~warfare~~, or decisive political danger from the influx of foreigners; the spirit of our constitution, and the nature of our protestant principles, having always inclined our governors to make England a place of refuge for the persecuted, and of succour to the distressed of all countries. On the principles of these laws every man is presumed to bear faith and love to that prince and country where he received protection during his infancy; and that one prince might not settle spies in another's country; but chiefly, that the rents and revenues of the country might not be drawn to the subjects of another. Some aver that the laws against aliens were introduced in the time of Henry II. when a law was made at the parliament of Wallingford, for the expulsion of strangers, in order to drive away the Flemings and Picards, who had been introduced into the kingdom by the wars of king Stephen. Others reckon the origin of this law more ancient; and that it is an original branch of the feudal law: for, by that law, no man can purchase any lands, unless he do fealty to the lords of whom the lands are holden; so that an alien, who owed a previous faith to another prince, could not take an oath of fidelity in another sovereign's dominions. Among the Romans, only the *Cives Romani* were esteemed freemen; but when their territories increased, all the Italians were made free, under the name of Latin, though they had not the privilege of wearing gold rings till the time of Justinian. Afterwards all born within the pale of the empire were considered as citizens. Upon the same principle, an individual born in the British colonies is considered as a natural-born subject.

ALIENATION, in law, from alienare, to pass away, a transfer of property from one person to another, and chiefly relating to lands and tenements. Alienation in mortmain is to pass or transfer lands or tenements to a religious body politic, or house.

ALIENATION, in fee, is the sale of lands, &c. in fee simple. All persons possessing lands, &c. may alien them to others, with particular exceptions; for no person can be supposed to transfer what he never possessed. In feoffments conditions that the feoffee shall not alien are void; but the grant of an estate in fee, on condition that the person who receives the grant shall not alien to any one particular person, is valid; and where a reversion stands in possession of the donor of an estate, he may restrain an alienation by condition. *Co. Lit.* 361, 118, 206. *Wood's Inst.* 141. *Hob.* 261, &c.

ALIENATIONS, by tenants for life, &c. incur a forfeiture of the estate. By the statute of Edward I. a bar was put to alienations, by what we call entails, which is an expedient (not founded on the strictest principles of justice) for procuring perpetuities in families; but counter expedients were devised to defeat this intent, and a practice was introduced of cutting off entails by fines; and of barring remainders and reversions by re-

coveries. The statute for alienations in Henry VII.'s time had a great effect on the constitution of that kingdom; as, among other regulations of that reign, it tended to throw the balance of power more into the hands of the people. By the stat. 12 Car. II. cap. 24, fines for alienations are taken away. Crown lands are only alienable under a faculty of perpetual redemption. The council of Lateran, held in 1123, forbids any clerk to alienate his benefice, prebend, or the like. By the laws of the ancient Jews, lands could only be alienated for the space of fifty years. At each return of the jubilee all returned again to the primitive owners, or their descendants.

ALIENATION, in mortmain, is making over lands, tenements, &c. to a body politic, or to a religious house, for which the king's license must first be obtained, otherwise the lands, &c. alienated will be forfeited.

ALIEN DUTY, an impost laid on all goods imported by aliens, over and above the customs paid for such goods imported by British subjects, and on British bottoms. It is otherwise called petty custom, and navigation duty.—Fish dried or salted, and cod fish or herring not caught in British vessels, and cured British, pay a double alien duty.—On what footing aliens are permitted to import foreign commodities into Great Britain, see **DUTY**.

ALIEN PRIORIES, a kind of inferior monasteries, formerly very numerous in England, and so called from their belonging to foreign abbeys.

ALIFORMES MUSCULI, from ala, a wing, and forma, shape, in anatomy, a pair of muscles, arising from the pterygoid bone, and ending in the neck of the lower jaw, towards the internal seat of the head.

ALIFORMES PROCESSUS, the prominences of the os cuneiforme.

ALIGHT. Active alihcan, Sax. to alight, lighten, to light. Hence by inference, to descend from a carriage; to dismount; discontinue a journey temporarily or altogether; to come down; to stop; to fall upon.

Kyn Henry in pe senep gær of hýs crounyng,
And enlene hondered gær and senene of our Lorde
alystyn. R. Gloucester, p. 430.

Bot at the last softlie he gan alicht
Of Calcidonis apoun the castell hicht.

Douglas, b. vi. p. 162.

There ancient night arriving, did alight
From her high weary waine. Faerie Queene.

There is alighted, at your gate,
A young Venetian. Shakp. Merch. of Venice.

Slackness breeds worms; but the sure traveller,
Though he alights sometimes, still goeth on. Herbert.

When marching with his foot, he walks till night;
When with his horse, he never will alight. Denham.

When Dedalus, to fly the Cretan shore,
His heavy limbs on jointed pinions bore;
To the Cunean coast, at length he came;
And, here alighting, built this costly frame.

Dryden's Aeneid.

But storms of stones, from the proud temple's height,
Pour down; and, on our batter'd helms, alight.

Dryden,

Upon the firm opacous globe
Of this round world, whose first convex divides
Vol. I.

The luminous inferior orbs, enclos'd
From chaos, and th' inroad of darkness old,
Satan alighted walks. Milton's Paradise Lost.
Should a spirit of superior rank, a stranger to human
nature, alight upon the earth, what would his notions
of us be? Addison, Spectator.

ALIGHT'. On light; to light, or enlighten; to set on fire; to enkindle.

The next morow, with Phœbus laump, the earth
Alighted clere; and eke the dawning day
The shadowes dark gan from the poale remoue.
Surrey. Aeneis.

And for to speaken ouer this,
In this parte of the aire it is,
That men ful ofte sene by night
The fire in sondrie form alight.

Gower. Con. A. b. vii.

The officer having by this time alighted his lamp, entered into the room to see him whom he accounted to be dead.

Shelton's Trans. Don Quixote, Ed. 1652.

ALIGNA, one of the Philippines, lying to the north of Mindanao. It is low and flat, and covered with thick forests.

ALIGNMENT, in maritime affairs, a supposed line drawn to preserve any part of a fleet in its just and proper direction.

ALII DE REGNO, and **ALII MULTI**, are phrases which often occur in our ancient records and historians. Their meaning has occasioned much dispute. Dr. Brady will have them to signify only tenants in capite; which Mr. Tyrrel endeavours to refute, and shew that they denote the whole commons of the kingdom.

ALIKE. See **LIKE**. With resemblance; without difference; in the same manner; in the same form.

pe bisshop of Canterbury, in common alle o liche,
Schedewit in ilk schire, alle his bisshop riche.

R. Brunne, p. 301.

And after thaym elike furth in euin space
Pristis and Cenature straif for the first place.

Douglas, book v. p. 132.

Prudence is goodly wisedom in knowinge of thynges:
Strength voydeth al aduersitees aliche euen.

Chaucer. Test of Love, book iii. fol. 308. c. 4.

The darkness hideth not from thee; but the night shineth, as the day: the darkness and the light are both alike to thee. Psalm cxxxix. 12.

With thee conversing, I forget all time;
All seasons, and their change, all please alike.

Paradise Lost.

Riches cannot rescue from the grave,
Which claims alike the monarch and the slave.

Dryden.

Let us unite, at least in an equal zeal, for those capital doctrines; which we all equally embrace, and are alike concerned to maintain. Atterbury.

Two handmaids wait the throne; alike, in place;
But diff'ren far, in figure and in face. Pope.

The boast of heraldry, the pomp of power,
And all that beauty, all that wealth e'er gave,
Await alike the inevitable hour,

The paths of glory lead but to the grave.

Gray's Elegy.

ALILÆI, in ancient geography, a nation of Arabia Felix, of whom Diodorus speaks. He mentions that their country, although burnt up with the sun, enjoyed frequent and copious showers, which rendered it fertile and productive; and also states that their mines produce excellent gold, in large pieces, the size of a nut, which need no refinement. Iron and copper were

proportionably scarce, and were therefore esteemed more valuable.

ALIMA, among mineralists, a kind of sand found in gold mines, out of which lead is extracted.

ALIMENA, in entomology, a species of *Papilio Nymphalis*, with dented black wings, an interrupted cœruleum fascia, and seven white marginal points, found in South America and India.

A'LIMENT,

ALIMENT'AL,

ALIMENT'ALLY,

ALIMENT'ARY,

ALIMENTAT'ION,

ALIMON'IOUS.

Alo, alitum, to find one in food. Alimentum; nourishment, food. That which cherishes, supports, comforts.

The sun that light imparts to all, receives
From all his alimental recompence
In humid exhalations, and at even
Sups with the ocean. *Milton's Par. Lost, book v.*
Plants do nourish; inanimate bodies do not: they have an accretion, but no alimentation.

Bacon's Natural History.

Wise men are of opinion, the bodies of animals cannot receive a proper *aliment* from ayrs.

Brown's Vulgar Errors.

New parts are added to our substance; and, as we die, we are born, daily; nor can we give an account how the *aliment* is prepared for nutrition; or by what mechanism it is distributed.

Glanville's Cœpsis Scientifica.

I do not think that water supplies animals, or even plants, with nourishment; but serves, for a vehicle to the *alimentary* particles, to convey and distribute them to the several parts of the body.

Ray on the Creation.

Of *alimentary* roots, some are pulpy and very nutritious, as, turnips and carrots. These have a fattening quality.

Arbuthnot on Aliments.

All bodies, which (by the animal faculties) can be changed into the fluids and solids of our bodies, are called *aliments*. In the largest sense, by *aliment*, I understand every thing which a human creature takes in common diet; as, meat, drink; and seasoning, as salt, spice, vinegar.

Arbuthnot.

'Th' industrious, when the sun in Leo rides,
Forget not, at the foot of every plant,
To sink a circling trench, and daily pour
A just supply of *alimental* streams,
Exhausted sap recruiting.

Philip.

The plethora renders us lean, by suppressing our spirits, whereby they are incapacitated of digesting the *alimonious* humours into flesh.

Harvey on Consumptions.

ALIMENT, in a physical sense, is whatever may be dissolved and turned into chyle, so as afterwards to become blood. The subject of aliments has been very diffusely and comprehensively discussed by Dr. Culien and others. We select a few practical and plain observations and directions upon this subject, from his *Materia Medica*, compared with other sources of information.

Our food, by the process of digestion, becomes in part, a very mild, sweet, and whitish liquor, resembling milk, and distinguished by the name of chyle. This being absorbed by the lacteal veins, is by them conveyed into circulation, and assimilated into the nature of blood, affording that supply of nutrition which the continual waste of the body is found to require. See *DIGESTION*. Next to air, food is the most

necessary thing for our preservation; on the choice of it, therefore, health greatly depends. The blood and juices naturally incline to become putrid and acrimonious: fresh chyle, duly received, prevents this destructive tendency, and preserves them in that mild state which alone consists with health. Generally, animal diet affords the most of this bland nutritious mucilage; while watery fluids dilute the too gross parts, and carry off what is become unfit for use. Of vegetables only the small portion of *jelly* which is separated from the farinaceous parts, after being much elaborated, is converted into the animal nature; yet the use of vegetables prevents both repletion and a too great tendency to a putrescent acrimony of the blood. In hot climates, as well as from the constitutional heat of particular persons, vegetables are required in the largest proportion. Animal substances afford the highest relish while our appetite continues; but sate the appetite before the stomach is duly filled. Vegetables may therefore be eaten after either flesh or fish; few herbs or fruits satiate so much as that the stomach may not be filled with them, when it is already satisfied with flesh or fish; for no diet, which is very nourishing, can be eaten to fulness, because its nutritious parts are oily and satiating. Loathing is soon the consequence of animal food alone: hot acid habits, too, receive from milk and vegetables what is needful for correcting their excesses; but cold, pituitous, and nervous habits, which require much nourishment from little digestion, and from the smallest quantity of food, may use animal diet more freely.

In the animal and vegetable, as well as in the human system, we behold the procession of decomposition and reproduction, and analyse the substances that administer to the growth and repair of each system most distinctly; but in their application to the wants and enjoyments of man, these phenomena become far more interesting. As 'lord of all below,' the whole circle of organic being moves around him for his benefit, and the student cannot be more gratified, than the common people may be advantaged, by an intelligent consideration of the admirable provisions in nature for its various movements.

From the structure of his teeth and alimentary canal, man would appear to be at present formed to subsist both on animal and on vegetable food, and these great organs of his frame are thus suited to all climates and their produce. Rice is said to be the chief food of the larger portion of mankind; and it is well known that the Brahmins and other eastern tribes, subsist wholly on vegetables. Northward, and in the colder regions of the earth, the stronger stimulus of animal food is resorted to, and few vegetables comparatively are eaten. Many savage nations, again, live almost wholly on fish, whilst others never taste them.

Mr. Moore, in his *Essay on the Materia Medica*, has some valuable observations on the power of habit over the animal economy, with regard to diet.

If any one suddenly changes his food, and feeds upon substances to which he has been un-

accustomed, he will undoubtedly become disordered. If a person, accustomed to vegetable farinacea, tries to eat a large portion of animal food, he will become feverish and plethoric; and if any one accustomed to meat suddenly adopts a vegetable diet, he will be in danger of losing strength, and being seized with indigestion. This is one reason why too great a variety of food is unwholesome; for the stomach cannot acquire the habit of digesting a variety of aliments with equal facility. Those persons, therefore, who use one or two kinds of aliments constantly and regularly, have their stomachs in far better order than those who indulge themselves in variety. But it would appear that even the habit of digesting a variety of aliments is in some degree to be acquired; for persons accustomed to variety are less disordered by it than others, although their digestive faculty is probably not in such perfect order as it is in those who live in a more simple manner. We need not, then, be surprised at the frequency of stomach complaints among the rich, for the luxurious superfluity of whose tables the earth, air, and sea are ransacked. This variety, especially when prepared with eastern spiceries, and all the refinements of modern cookery, has another bad effect; it produces a false appetite, and forms a temptation to indulge the palate after the natural appetite is gone, by which the stomach is gorged and overloaded; whereas, those who live upon a few plain and simply dressed aliments, have no excitement to eat more than their natural appetite prompts. From these, and many other causes, disorders in the stomach are frequent; and as some aliments are more easily digested than others, directions respecting diet are necessary for weak and disordered stomachs, which are unable to digest aliments that are easily overcome by stomachs of greater health and power. Animals discover their proper food by the senses of taste and smelling. Mr. Moore conceives that men, in a great degree, do the same; and, there-

fore, that a strong presumption may be formed respecting the wholesomeness of alimentary substances, by attending to the natural inclination of men. But the greatest care must be taken not to confound natural tastes with those acquired by habit and prejudice, or brought on by diseases. It is inconsistent with the admirable order and constitution of the universe, to conceive that men will naturally have a desire for such aliments as are improper for them, and loathe such as are wholesome. But we know that, in consequence of necessity, example, or prejudice, men may be induced to use, as food, substances at first disagreeable, but which, by degrees, they may be brought to prefer to more wholesome diet. It is owing to this, that many, the rich in particular, instead of plain and salutary food, prefer what is highly seasoned with hot pungent spices. These acrid and stimulating substances are detested by every person at first; but even children may be induced to eat them in imitation of their friends and relations; and, having acquired a taste for them, the stimulus given to the stomach becomes at last necessary.

But that those stimulants, though they seem to assist, yet, in reality, and in the course of time, impair the appetite and digestion, is evident from this, that the stomach which could with ease digest plain food, before it was accustomed to spiceries, cannot afterwards digest it without their assistance. A stomach in this situation, therefore, may justly be said to be in a diseased state. And it is not without foundation, that diseases, and premature old age, have been imputed to the habit of using stimulating and acrid condiments. See *Essay on the Materia Medica*, by James Moore.

We annex a list of vegetables and animals according to the Linnaean system from which the aliments of man are principally derived; beginning with his simplest and perhaps his primitive food.

TABLE I.
VEGETABLE SUBSTANCES yielding Human Food.

Order.	Linnaean Name.	Common Name.	Where eaten.	Character as Food.
Herbs.	<i>Apium petroselinum</i> .	Parsley	{ Europe generally .	Aromatic, seeds diuretic.
	— <i>gravolens</i> . .	Celery	—	Mucilag. and aromatic.
	<i>Asparagus officinalis</i> .	Asparagus	—	Mucilag. stimulant, quick of digestion.
	<i>Brassica oleracea</i> . .	Colewort and cabbage	—	Watery and flatulent, Cauliflower best.
	— <i>italica</i> . . .	Brocoli	—	Delicious but flatulent.
	<i>Cichorium endivia</i> . .	Endive	—	Bitter and wholesome.
	<i>Crambe maritima</i> . .	Sea kale	—	Quick of digestion and stimulant.
	<i>Cynara scolymus</i> . .	Artichoke	—	Sweet, mucilaginous.
	<i>Lactua sativa</i> . . .	Garden lettuce	—	Diuretic, narcotic, most digestible boiled.
	<i>Lepidium sativum</i> . .	— cress	—	Pungent, bitter, & aromat.
	<i>Portulaca oleracea</i> . .	— purslane	—	Laxative.

Order.	Linnaean Name.	Common Name.	Where eaten.	Character as Food.
Herbs—Herbs.	<i>Rumex acetosa</i> . . .	Common sorrel . . .	Europe gen. and much esteemed in France	Wholesome, contains oxalic and tartaric acid.
	<i>Sisymbrium nasturtium</i>	Water cress . . .		Wholesome, bitter and pungent.
	<i>Spinacia</i>	Spinage		Flatulent.
Radices—Roots.	<i>Allium ascalonicum</i> .	Shallot	———	Acrid, fit for sauce.
	— <i>cepa</i>	Onion	———	Stimulant.
	— <i>porrum</i>	Leek	———	Idem.
	— <i>sativum</i>	Garlic	———	Acrid, good for sauce.
	— <i>scorodoprasum</i>	Rocambole	———	Idem.
	<i>Beta vulgaris</i>	Red beet	———	Very saccharine, should be well boiled.
	— <i>cicla</i>	White beet	———	Idem.
	— <i>hybrida</i>	Mangel wurzel . .	———	Wholesome.
	<i>Brassica rapa</i>	Turnip	———	Light and nutritious.
	<i>Cichorium intybus</i> .	Succory	I. in Germany as coffee	Bitter and wholesome.
Fructus—Fruits.	<i>Convolvulus batatas</i> .	Spanish potatoe . .		Nutritive
	<i>Dioscorea alata</i> .	Yams	———	Idem, mealy.
	— <i>bulbifera</i>		———	
	— <i>sativa</i>		———	
	<i>Daucus carota</i>	Carrot	———	Mucilag. saccharine.
	<i>Helianthus tuberosus</i> .	Jerusalem artichoke .	———	Idem.
	<i>Jatropha manihot</i> .	Bitter and sweet cassava .	———	Nutritious. Of the roots is made tapioca.
	— <i>janipha</i>		———	Mucilaginous.
	<i>Maranta arundinacea</i> .	Indian arrow root .	———	Sweet, mucilaginous.
	<i>Orchis mascula</i>	Salep	———	Nutritious.
Fructus—Fruits.	<i>Pastinaca sativa</i>	Parsnip	———	Warm, acrid, watery.
	<i>Raphanus sativus</i>	Radish	———	Mucilaginous.
	<i>Scorzonera hispanica</i> .	Viper's grass . . .	Spain and S. Europe	Sweet, quick of digestion
	<i>Siun sisarum</i>	Skirret		Anylaceous and readily digested.
	<i>Solanum tuberosum</i> .	Potatoe	———	Sweet.
	<i>Tragopogon porrifolium</i>	Salsafi	———	
Fructus—Fruits.	<i>Artocarpus incisa</i> . .	Bread fruit	Warm climates	Wholesome.
	<i>Amygdalus persica</i> . .	Peach and nectarine .	Europe gen.	Delicious.
	<i>Annona muricata</i> . . .	Custard apple . . .	———	Cooling and wholesome.
	<i>Berberis vulgaris</i>	Barberry	———	Wholesome.
	<i>Bromelia ananas</i>	Pine apple	———	Acid and agreeable.
	<i>Brosimum alicastrum</i> .	Bread nut	———	Wholesome.
	<i>Cactus opuntia</i>	Indian fig, or prickly pear .	———	Idem.
	<i>Citrus aurantium sinense</i> .	China orange	East	Grateful.
	— <i>aurantium hispalense</i>	Seville orange . . .	Spain . . .	Rough, sour, bitter, peel aromatic.
	<i>Citrus medica</i>	Lemon	———	Acid, grateful.
Fructus—Fruits.	<i>Cucurbita citrullus</i> . . .	Water lemon	Europe gen.	Juicy and cooling.
	<i>Cucumis sativus</i>	Cucumber	———	Watery, mucilag. difficult of digestion.
	— <i>melo</i>	Melon	———	Watery, unwholesome.
	<i>Ficus carica</i>	Fig	East & Europe	Mucilaginous.
	<i>Fragaria vesca</i>	Strawberry	Europe gen.	Pleasant, cooling.
	<i>Garcinia mangostana</i> . .	Mangosteen	———	Well flavoured.
	<i>Mangifera indica</i>	Mango	East	Wholesome.
	<i>Mespilus germanica</i> . . .	Medlar	Europe gen.	Rough, astringent.
	<i>Morus nigra</i>	Mulberry	———	Cooling.
	<i>Musa paradisiaca</i> . . .	Plantain tree . . .	East, &c.	Wholesome.
Fructus—Fruits.	<i>Phoenix dactylifera</i> . .	Date	———	Sweet, mucilaginous.
	<i>Prunus armeniaca</i> . . .	Apricot	Europe gen.	Wholesome, more nutritious than peach or nectarine.

Order.	Linnæan Name.	Common Name.	Where eaten.	Character as Food.
Fructus—Fruits.	<i>Prunus domestica</i> . . .	Plum	Europe gen.	Apt to disorder bowels.
	— <i>cerasus</i> . . .	Cherry	—	Unwholesome.
	<i>Punica granatum</i> . . .	Pomegranate	East	Cooling, disorder bowels.
	<i>Pyrus communis</i> . . .	Pea	Europe gen.	Refreshing, flatulent.
	— <i>cydonia</i> . . .	Quince	—	Forms marmalade.
	— <i>malus</i> . . .	Apple	—	Wholesome.
	<i>Ribes grossularia</i> . . .	Gooseberry	—	Cooling, disorder bowels.
	— <i>nigrum</i> . . .	Black currant	—	Cooling, sub-acid.
	— <i>rubrum</i> . . .	Red currant	—	More acid, but very wholesome.
	<i>Rosa canina</i>	Hip	—	Pleasant.
	<i>Rubus idæus</i>	Raspberry	—	Cooling, wholesome.
	<i>Vaccinium myrtillus</i> . . .	Bilberry	—	Agreeable.
	— <i>oxyccoccus</i> . . .	Cranberry	—	Astringent, acid.
	<i>Vitis vinifera</i>	Grape	—	Saccharine, cooling, and wholesome.
Semina—Seeds.	<i>Amygdalus communis</i> . . .	Almond	Europe, Asia	Indigestible, husk acid.
	<i>Anacardium occidentale</i> . . .	Cashew nut	—	Indigestible.
	<i>Avena sativa</i>	Oat	—	Demulcent, laxative.
	<i>Coccus nucifera</i>	Cocoa nut	Warm climates	Indigest. milk agreeable.
	<i>Corylus avellana</i>	Hazel nut and filbert	Europe . . .	Indigestible, husk acid.
	<i>Fagus castanea</i>	Chesnut	—	Indigest. best roasted.
	<i>Hordeum vulgare</i>	Barley	—	Viscid, indigestible, except pearl barley.
	<i>Holcus sorghum</i>	Guinea corn	West Indies	Indigestible.
	<i>Juglans regia</i>	Walnut	Europe . . .	Husk astringent and acrid, nut nutritious.
	<i>Oryza sativa</i>	Rice	East . . .	Wholesome.
	<i>Panicum miliaceum</i>	Millet	Gen. growth	Nutritive.
	<i>Phaseolus vulgaris</i>	Kidney bean	Europe . . .	Farinaceous.
	<i>Pistacia vera</i>	Pistachio nut	East . . .	Wholesome.
	<i>Pisum sativum</i>	Pea	Europe gen.	Idem.
	<i>Polygonum fagopyrum</i>	Buck wheat	—	Idem.
	<i>Secale cereale</i>	Rye	—	Idem.
	<i>Theobroma cacao</i>	Chocolate nut	East . . .	Idem.
Alga—Lichens & Sea-weeds.	<i>Triticum aestivum</i>	Wheat	Europe . . .	Best grain causing starch, glutinous and mucilaginous matter.
	<i>Vicia faba</i>	Broad bean	—	Astringent, flatulent.
	<i>Zea mays</i>	Indian corn	West Indies, America, & S. Europe	Laxative & wholesome.
Fungi—Mushrooms.	<i>Lichen islandicus</i> . . .	Iceland liverwort . . .	North . . .	Bitter, mucilaginous.
	<i>Fucus esculentus</i> . . .	Eatable fucus . . .	—	Mucilaginous.
Agaricus campestris . Common mushroom . Europe . . Stimul. but indigestible				
A great number of Fungi are edible, others are not.—See Sowerby's Coloured Figures of English Fungi, 3 vols. and suppl. fol.				

Chemical analysis has satisfactorily determined that the nutritive qualities of vegetables depend upon the nature of their compost, and are in proportion to the relative quantities of mucilage, oil, starch, gluten, and sugar which they contain. This species of aliment, less stimulating indeed, than that which is derived from the animal kingdom, nevertheless yields its nutriment more readily to the process of digestion. The quality of chyle derived from vegetables, is inferior to that which is derived from animals; and hence, a much greater proportion of aliment is necessary

for those whose support is derived from these substances. On a review of the above table, we shall only add by way of appendage, that the seeds of certain plants belonging to the natural order of gramina, and the leguminous family of plants, yield the greatest proportion of nutritive matter; potatoes, yams, grains, &c., claim the next rank; to these, succeed beets, carrots, acids, dulcescent fruits, as grapes, dates, plums, apricots, &c. and lastly, the oily seeds, as almonds, filberts, chesnuts, &c.

TABLE II.

ANIMAL SUBSTANCES yielding Human Food.—(MAMMALIA, Class of Linnaeus.)

Order.	Linnean Name.	Common Name.	Where Eaten.	Character as Food.
I. Primates.	<i>Vespertilio vampyrus</i>	Roulette	India . . .	Very good.
II. Bruta.	<i>Myrmecophaga tetradactyla</i>	Middle ant-eater . . .	Guinea . .	Good.
	<i>Manis pentadactyla</i>	Pangolin	India . .	Fat, delicious.
	<i>Dasypus</i>	Armadillo	S. America .	Delicious, when young.
	— <i>tricinctus</i>	3 banded	—	Idem.
	— <i>septemcinctus</i>	8 banded	—	Idem.
	<i>Rhinoceros unicornis</i>	One-horned rhinoceros	—	Like coarse pork.
	— <i>bicornis</i>	Two-horned rhinoceros	Warm climates	Idem.
	<i>Elephas maximus</i>	Great elephant	—	Good.
III. Phere.	<i>Phoca vitulina</i>	Common seal	North & South	Good.
	— <i>leonina</i>	Bottle-nosed seal . . .	—	Idem.
	<i>Viverra vulpecula</i>	Coasse	Universally .	Idem.
	— <i>fossa</i>	Fossane weasel	—	Idem.
	<i>Lutra Brazilianiana</i>	Brazilian otter	S. America .	Delicate.
	<i>Ursus arctos fuscus</i>	Brown bear	Warm climates	Delicate, paw exquisite
	— <i>niger</i>	Black bear	Europe, &c.	Indigestible.
	<i>Ursus maritimus</i>	Polar bear	North . .	Like mutton.
	— <i>meles</i>	Common badger	Universally .	Highly esteemed.
	<i>Didelphis woapink</i>	Virginian opossum	America .	Like sucking pig.
	— <i>marsupialis</i>	Molucca opossum	—	Delicate.
	— <i>cinerivora</i>	Cayenne opossum	—	Equal to hare.
	<i>Macropus major</i>	Great kangaroo	N. Holland .	Coarse.
	<i>Erinaceus madagascariensis</i>	Striped hedgehog	India . . .	Flabby, insipid.
IV. Glires.	<i>Hystrix cristata</i>	Crested porcupine	Rome . . .	Good.
	— <i>prehensilis</i>	Brazilian porcupine	Brazil . . .	Idem.
	<i>Cavia cobaya</i>	Variegated cavy, or Guinea pig	Union . . .	Idem.
	— <i>paca</i>	Spotted cavy	—	Very delicate.
	— <i>capybara</i>	Capybara	—	Oily and fishy taste.
	— <i>aguti</i>	Agouti	S. America .	Excellent flavour.
	— <i>acuschy</i>	Olive cavy	—	
	— <i>aperea</i>	Rock cavy	—	
	<i>Castor fiber</i>	Castor beaver	N. America .	Good.
	<i>Mus perchal</i>	Perchal rat	India . . .	Moderate.
	— <i>amphibius</i>	Water rat	France . . .	Idem.
	— <i>leminus</i>	Lemming rat	Lapland .	Resembles squirrel.
	— <i>maritimus</i>	African rat	Africa . .	Good.
	<i>Arctomys marmota</i>	Common marmot	S. Europe .	Disagreeable.
	— <i>monax</i>	Maryland marmot	N. America .	Good.
	— <i>bobac</i>	Bobak	—	Resembles hare.
	<i>Sciurus vulgaris</i>	Common squirrel	N. Europe .	Resembles barn-door fowl.
	— <i>cinerereus</i>	Grey squirrel	—	Delicate.
	<i>Myoxus glis</i>	Fat dormouse	Europe gen.	Idem.
	<i>Dipus jaculus</i>	Common jerboa	East . . .	Idem.
	<i>Lepus timidus</i>	Hare	Europe gen.	Stimul. well-flavoured.
	— <i>cuniculus</i>	Rabbit	—	Easy of digestion.
	— <i>viscaccia</i>	Peruvian hare	S. America .	Tender.
	— <i>capensis</i>	Cape hare	S. Africa .	White and good.
	— <i>minimus</i>	Minute hare	—	Delicate.
	— <i>braziliensis</i>	Brazilian hare	Brazil . .	Good.
	<i>Hyrax capensis</i>	Cape hyrax	S. Africa . .	Idem.
	— <i>syriacus</i>	Syrian hare	Asia . . .	Idem.

TABLE II.—Continued.

Order.	Linnæan Name.	Common Name.	Where eaten.	Character as Food.
V. Pecora.	<i>Camelus glama</i> . . .	Glama	East . . .	Like mutton.
	— <i>vicugna</i> . . .	Viccunna	—	Excellent.
	— <i>guanaco</i> . . .	Guanaco	—	Idem.
	— <i>arcuanus</i> . . .	Chilihuque	S. America . . .	Moderate.
	<i>Moschus moschiferus</i> . . .	Tibetian musk	Asia . . .	Delicate.
	— <i>americanus</i> . . .	Brazilian musk	America . . .	Light and delicate.
	<i>Cervus alces</i> . . .	Elk	N. Europe . . .	Good tongues valued.
	— <i>tarandus</i> . . .	Rein deer	—	Easy of digestion.
	— <i>dama</i> . . .	Fallow deer	Universally .	Delicate.
	— <i>elaphus</i> . . .	Stag	—	Dry, but delicate.
	— <i>muntjac</i> . . .	Rib-faced deer	—	Disagreeable.
	— <i>capreolus</i> . . .	Roe buck	—	Fair grained and juicy.
	<i>Antilope orcas</i> . . .	Indian antelope	East	Coarse and tough.
	— <i>ourebi</i> . . .	Ourebi antelope	—	Highly esteemed.
	— <i>oreotragus</i> . . .	Klipspringer antelope	—	Strong, nutritious.
	— <i>bubalis</i> . . .	Cervine antelope	N. Asia . . .	Digest. and wholesome.
	— <i>saiga</i> . . .	Scythian antelope	Africa . . .	Lump in the shoulders a great delicacy.
	— <i>gnu</i> . . .	Gnou	—	Good.
	— <i>rupicapra</i> . . .	Chamois	Switzerland . . .	Idem.
	<i>Capra ibex</i> . . .	Wild goat	Asia . . .	Universally
	— <i>aegagrus</i> . . .	Caucasan goat	—	Wholesome.
	— <i>hircus</i> . . .	Domestic goat	—	Strong and nourishing.
	<i>Ovis aries</i> . . .	Common sheep	Generally . . .	Coarse.
	<i>Bos taurus</i> . . .	Common ox	—	Disagreeable.
	— <i>taurus indicus major</i>	Greater Indian ox	East	Cape ox
	— <i>americanus</i> . . .	American bison	America . . .	Coarse, marrow delicate
	— <i>bubulus</i> . . .	Buffalo	Africa . . .	Digest. and wholesome.
	— <i>moschatus</i> . . .	Musk bull	—	Lump in the shoulders a great delicacy.
	— <i>caffer</i> . . .	Cape ox	—	Good.
VI. Bellæ.	<i>Equus caballus</i> . . .	Generous horse	Tartary . . .	Idem.
	— <i>hemionus</i> . . .	Wild mule	Asia	Moderate.
	— <i>asinus</i> . . .	Ass	Arabia	Esteemed.
	<i>Hippopotamus amphibius</i> . . .	Amphibious hippopotamus	Africa	Excellent.
	<i>Tapir americanus</i> . . .	Long-nosed tapir	America	Idem.
	<i>Sus scrofa</i> . . .	Common hog	Generally . . .	Wholesome.
VII. Cete.	— <i>tajassu</i> . . .	Mexican, or Peccary hog	America	Strong and nourishing.
	— <i>babyrussa</i> . . .	Indian, or Babyroussa hog	East	Coarse.
	— <i>balenæ mysticetus</i> . . .	Common whale	North & South . . .	Wholesome.
	<i>Delphinus phocæna</i> . . .	Porpoise	—	Dry and insipid.
	— <i>dolphis</i> . . .	Dolphin	Generally . . .	Tough and tasteless.

TABLE III.
BIRDS yielding Human Food.—Linnæan Class, AVES.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character, as Food.
I. Accipitres.	<i>Strix wapacuthu</i> . . .	Wapacuthu owl	America . . .	Delicate.
	<i>Lanius ruficollis</i> . . .	Wood-chat shrike	Africa . . .	Good.

TABLE III.—Continued.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character, as Food.
II. Picre.	<i>Corvus corax</i> . . .	Raven	North	Indifferent.
	— <i>frugilegus</i> . . .	Rook	Generally	Digest. & well flavoured.
	<i>Cuculus canorus</i> . . .	Common cuckoo	—	Resembles land-rail.
	<i>Picus viridis</i> . . .	Woodpecker, green	Europe	Indigestible.
	— <i>erythrocephalus</i> . . .	red-headed	—	Good.
	<i>Sitta Europæa</i> . . .	European nut-hatch	—	Idem.
III. Anseres.	<i>Anas cygnus</i> . . .	Wild swan	Europe	Esteemed.
	— <i>anser</i> . . .	Goose	—	Strong stimulant.
	— <i>bernicla</i> . . .	Bernacle, or Brent goose	—	Fishy, indigestible.
	— <i>moschata</i> . . .	Muscovy duck	—	Resembles lark.
	— <i>penelope</i> . . .	Widgeon	—	
	— <i>ferina</i> . . .	red-headed	—	
	— <i>crecca</i> . . .	Common teal	—	Resembles wild duck.
	— <i>boschas</i> . . .	Duck, wild	—	
	— <i>domestica</i> . . .	, tame	—	Delicate and stimulant.
	<i>Alca arctica</i> . . .	Puffin	North	Idem.
	— <i>torda</i> . . .	Razor-bill	—	Fishy.
	— <i>cirrhata</i> . . .	Tufted hawk	—	Admired.
	<i>Pelecanus bassanoides</i> . . .	Gannet	Generally	
	<i>Larus marinus</i> . . .	Black-backed gull	—	Fishy.
IV. Gralla.	<i>Phænicopterus ruber</i> . . .	Red flamingo	Europe	Esteemed.
	<i>Ardea grus</i> . . .	Common crane	— & Africa	Tough, bad.
	— <i>cineræa</i> . . .	heron	—	Valued.
	— <i>stellaris</i> . . .	Bittern	Generally	Resembles hare.
	<i>Scolopax rusticola</i> . . .	Woodcock	—	
	— <i>gallinago</i> . . .	Snipe	—	
	— <i>gallinula</i> . . .	Gid, or jack snipe	—	
	— <i>glottis</i> . . .	Great plover	Europe	Light, savoury, and di-
	— <i>totanus</i> . . .	Spotted snipe	—	gestive.
	— <i>limosa</i> . . .	Stone plover	—	
	— <i>lapponica</i> . . .	Red godwit	—	
	<i>Tringa pugnax</i> . . .	Ruff and reeve	—	
	— <i>vanellus</i> . . .	Lapwing	—	
	— <i>cincclus</i> . . .	Purre	—	
	— <i>squatorola</i> . . .	Grey plover	Europe	Savoury.
	<i>Charadrius morinellus</i> . . .	Totterell	—	
	— <i>pluvialis</i> . . .	Green plover	—	
	— <i>ædinclemus</i> . . .	No-kneed bustard	—	
	— <i>himantopus</i> . . .	Long-legged plover	—	
V. Gallinæ.	<i>Fulica fusca</i> . . .	Brown gallinule	—	Digest. and stim.
	— <i>chloropus</i> . . .	moor hen	—	
	— <i>porphyrio</i> . . .	Purple gallinule	—	
	<i>Rallus aquaticus</i> . . .	Water rail	—	Idem.
	<i>Pavo cristatus</i> . . .	Peacock	Europe & Asia	Rarely eaten.
	<i>Meleagris gallopavo</i> . . .	Turkey	—	Light.
	<i>Penelope cristata</i> . . .	Guiana Guan	America	Idem.
	<i>Crax alector</i> . . .	Crested curassour	—	Idem.
	<i>Phasianus gallus</i> . . .	Dunghill cock and hen	Europe	Delicate.
	— <i>colchicus</i> . . .	Common pheasant	—	Idem.
	<i>Numida meleagris</i> . . .	Guinea hen	—	Idem.
	<i>Tatras urogallus</i> . . .	Mountain cock	—	Disagreeable.
	— <i>tetrix</i> . . .	Black cock	—	
	— <i>scoticus</i> . . .	Red game	—	Digestible.
	— <i>lagopus</i> . . .	White game	—	
	— <i>perdix</i> . . .	Common partridge	—	Light.
	— <i>coturnix</i> . . .	Quail	—	Inferior to the above.

TABLE III.—Continued.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character, as Food.
V. Passeræ.	<i>Columba domestica</i>	Common pigeon . . .	Europe . .	Savoury and stim.
	— <i>palumbus</i>	Ring dove . . .		Delicate.
	<i>Alauda</i> . . .	Lark . . .	—	Highly esteemed.
	<i>Turdus viscivorus</i>	Missel thrush . . .	—	
	— <i>pilaris</i>	Fieldsfare . . .	—	
	— <i>merula</i>	Blackbird . . .	—	
	— <i>polyglottus</i>	Mimic thrush . . .	America . .	Delicate.
	<i>Loxia curvirostra</i>	Cross bill . . .		
	— <i>coccothraustes</i>	Hawfinch . . .	Europe . .	Tender.
	— <i>cloris</i>	Greenfinch . . .		
	<i>Emberiza nivalis</i>	Snow bunting . . .	—	Savoury.
	— <i>miliaria</i>	Bunting . . .	—	
	— <i>hortulana</i>	Ortolan . . .	—	Delicate in the extreme.
	— <i>citrinella</i>	Yellow hammer . . .	—	
	— <i>oryzivora</i>	Rice bird* . . .	India & Amer.	Esteemed.
	<i>Fringilla coelebs</i>	Chaffinch . . .		
	— <i>anonti fringilla</i>	Brambling . . .	Europe . .	
	— <i>domestica</i>	House sparrow . . .		Bitter taste.
	— <i>montana</i>	Tree sparrow . . .	—	
	<i>Motacilla modularis</i>	Hedge sparrow . . .	—	
	— <i>ficedula</i>	Epicurean warbler . . .	—	
	— <i>œnanthe</i>	Wheatear . . .	—	
	— <i>rubetra</i>	Whin chat . . .		Savoury and Digest.
	— <i>rubicola</i>	Stone chatter . . .	—	
	— <i>phenicurus</i>	Red start . . .	—	
	— <i>erithacus</i>	Red tail . . .	Generally .	
	<i>Hirundo esculenta</i>	Esculent swallow . . .		Digestible.

* The nests of these birds are thought a delicacy by the Indians.

TABLE IV.

AMPHIBIA yielding Human Food.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character, as Food.
I. Reptilia.	<i>Testudo mydas</i> . . .	Green turtle . . .	South Seas .	Indigestible.
	— <i>caretta</i> . . .	Loggerheaded turtle . .		Coarse.
	— <i>ferox</i> . . .	—	Greece . .	Finely flavoured.
	— <i>græca</i> . . .	Land turtle . . .		Esteemed.
	<i>Rana pipa</i> . . .	Pipa . . .	Surinam . .	Moderate.
	— <i>temporaria</i> . . .	Common frog . . .		Idem.
	— <i>esculenta</i> . . .	Edible . . .	—	Not very nutritious.
	— <i>catesbeina</i> . . .	Bull frog . . .	—	Idem.
	<i>Lacerta alligata</i> . . .	Alligator . . .	America . .	White, delicious.
	— <i>iguana</i> . . .	Common guana . . .		Delicate.
II. Serpentes.	<i>Crotalus horridus</i> . . .	Banded Rattlesnake . . .	America . .	White and delicate.
	<i>Coluber vivipera</i> . . .	Viper . . .		Nourishing.
	— <i>berus</i> . . .	Adder . . .	Italy . . .	

TABLE V.

PISCES.—Fishes yielding Human Food.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character as Food.
I. Apodes.	<i>Muræna anguilla</i> . . .	Common eel . . .	Generally . .	Indigestible.
	<i>conger</i> . . .	Conger eel . . .	—	delicate.
	<i>Romana</i> . . .	Roman muræna . . .	Europe . .	Excellent.
	<i>echidna</i> . . .	Southern muræna . . .	Javan . .	Idem.
	<i>Monopterus javanicus</i> . . .	Javan monoptere . . .	—	—
	<i>Gymnotus carapo</i> . . .	Carapo gymnot . . .	America . .	Wholesome
	<i>Ophidium barbatum</i> . . .	Bearded ophidium . . .	—	Coarse.
	<i>mastacembal-</i> <i>· balus</i> . . .	Mastacembalus . . .	Asia . . .	Like eel.
	<i>Odontognathus aculeatus</i> . . .	Aculeated odontognathus . . .	East . . .	Moderate.
	<i>Ammodytes tobianus</i> . . .	Sand lance . . .	Isle of Wight . .	Esteemed.
	<i>Trichiarus argenteus</i> . . .	Silver trichiure . . .	America . .	Tolerable.
	<i>Anarhicas lupus</i> . . .	Common wolf fish . . .	N. Europe . .	Idem.
	<i>Xiphias platypterus</i> . . .	Broad-finned sword fish . . .	—	—
	<i>makaira</i> . . .	Short snouted sword fish . . .	Generally . .	Coarse.
	<i>Stromateus paru</i> . . .	Pau stromat . . .	—	—
II. Jugulares.	<i>cinerous</i> . . .	Ash-coloured stromat . . .	America &	—
	<i>argenteus</i> . . .	Silver stromat . . .	other places . .	Esteemed.
	<i>niger</i> . . .	Black stromat . . .	—	—
	<i>Callionymus lyra</i> . . .	Generous dragonet . . .	North . . .	Palatable.
	<i>dracunculus</i> . . .	Sordid dragonet . . .	—	—
	<i>Uranoscopus scaber</i> . . .	Bearded star-gazer . . .	Generally . .	Coarse.
	<i>Trachinus draco</i> . . .	Weaver . . .	Europe . .	Esteemed.
	<i>Gadus morrhua</i> . . .	Cod . . .	Newfoundland . .	Idem.
	<i>æglefinus</i> . . .	Haddock . . .	—	—
	<i>callarias</i> . . .	Dorse . . .	—	—
III. Thoracici.	<i>barbatus</i> . . .	Pout . . .	—	—
	<i>luscus</i> . . .	Bib . . .	—	—
	<i>minutus</i> . . .	Poor . . .	European & other seas . .	Excellent.
	<i>saida</i> . . .	Saida . . .	—	—
	<i>merlangus</i> . . .	Whiting . . .	—	—
	<i>carbonarius</i> . . .	Coal fish . . .	—	—
	<i>pollachius</i> . . .	Pollack . . .	—	—
	<i>morluccius</i> . . .	Hake . . .	—	Indifferent.
	<i>molva</i> . . .	Ling . . .	—	—
	<i>lota</i> . . .	Burbot . . .	—	Esteemed.
	<i>brosme</i> . . .	Torsk . . .	—	—
	<i>Blennius ocellaris</i> . . .	Ocellated blenny . . .	—	—
	<i>gunellus</i> . . .	Gunnel . . .	—	Coarse.
	<i>Echeneis remora</i> . . .	Sucking fish . . .	European & other seas . .	Like fried artichoke.
	<i>Coryphæna hippurus</i> . . .	Common coryphene . . .	—	—
	<i>equialis</i> . . .	Brazilian coryphene . . .	—	—
	<i>novacula</i> . . .	Razor coryphene . . .	Moluccas &	—
	<i>quinque-</i> <i>maculata</i> . . .	Five-spotted cory- phene . . .	Europe . .	Excellent.
	<i>chrysurus</i> . . .	Gilt tailed coryphene . . .	—	—
	<i>Gobius niger</i> . . .	Common goby . . .	Generally . .	Esteemed.
	<i>jozo</i> . . .	Blue-finned goby . . .	—	Poor.
	<i>plumieri</i> . . .	Plumiers goby . . .	—	Esteemed.
	<i>Cottus gobio</i> . . .	River bullhead . . .	—	—
	<i>grunniens</i> . . .	Grunting . . .	N. Europe . .	Liver injurious.
	<i>scorpius</i> . . .	Lasher . . .	—	—
	<i>Scorpaena didactyla</i> . . .	Didactyle scorpaena . . .	Generally . .	Excellent.

TABLE V.—Continued

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character as Food.
	<i>Zeus vomer</i> . . .	Brazilian dory . . .	Generally . .	Not much esteemed.
	— <i>ciliaris</i> . . .	Ciliated dory . . .	— . .	Coarse.
	— <i>faber</i> . . .	Common dory . . .	— . .	Esteemed.
	<i>Pleuronectes hippoglossus</i> . . .	Halibut . . .	N. Europe . .	Indigestible.
	— <i>cynoglossus</i> . . .	Lesser halibut . . .	— . .	Superior.
	— <i>platessa</i> . . .	Plaice . . .	— . .	Wholesome.
	— <i>limanda</i> . . .	Dab . . .	— . .	
	— <i>lævis</i> . . .	Smear dab . . .	— . .	
	— <i>linioides</i> . . .	Long dab . . .	— . .	
	— <i>flesus</i> . . .	Flounder . . .	— . .	
	— <i>solea</i> . . .	Sole . . .	— . .	
	— <i>zebra</i> . . .	Zebra sole . . .	Indian seas . .	Esteemed.
	— <i>marmoratus</i> . . .	Marbled sole . . .	Holland, &c. . .	Idem.
	— <i>tuberculatus</i> . . .	Turbot . . .		
	<i>Chatodon imperator</i> . . .	Imperial chaetodon . . .		
	— <i>catesbeii</i> . . .	Angel chaetodon . . .		
	— <i>vagabundus</i> . . .	Wandering chaetodon . . .	East & other places . . .	Excellent.
	— <i>rostratus</i> . . .	Jaculator . . .		
	— <i>bifasciatus</i> . . .	Bifasciated chaetodon . . .		
	— <i>glaucus</i> . . .	Glaucous chaetodon . . .		
	— <i>sordidus</i> . . .	Sordid chaetodon . . .		
III. Thoraci, <i>Continué.</i>	<i>Acanthurus nigricans</i> . . .	Blackish acanthurus . . .	India, America, & Arabia . . .	Idem.
	<i>Trichopus goramy</i> . . .	Goramy trichopus . . .	China . . .	Idem.
	<i>Sparus aurata</i> . . .	Gilt head sparus . . .		
	— <i>spinifer</i> . . .	Spined sparus . . .	Europe . . .	Idem.
	— <i>inæna</i> . . .	Sparus . . .		
	<i>Labrus scarus</i> . . .	Scarce labrus . . .		
	<i>Ophicephalus punctatus</i> . . .	Punctated ophicephalus . . .		Delicate.
	— <i>striatus</i> . . .	Striated . . .		Idem.
	<i>Scomber scomber</i> . . .	Mackarel . . .		Indigestible.
	— <i>thymnus</i> . . .	Tunny . . .		Coarse.
	<i>Mullus barbatus</i> . . .	Red surmullet . . .		Digestible.
	— <i>surmulatus</i> . . .	Striped . . .		
	<i>Trigla lyra</i> . . .	Piper . . .		Indigestible.
	<i>Cobitis barbatula</i> . . .	Loach, or ground ling . . .	Europe . . .	Savoury.
	<i>Salmo salar</i> . . .	Salmon . . .		
	— <i>trutta</i> . . .	Sea-trout . . .		
	— <i>fario</i> . . .	Trout . . .		
	— <i>alpinus</i> . . .	Charr . . .		
	— <i>salmarius</i> . . .	Salmon trout . . .		Digest. Nutritious.
	— <i>eperlanus</i> . . .	Smelt . . .		
	— <i>albula</i> . . .	Whiting . . .		
	— <i>thymallus</i> . . .	Grayling . . .		
	<i>Esox lucius</i> . . .	Pike . . .		Ready of digestion.
	<i>Mugil cephalus</i> . . .	Mullet . . .		Indigestible.
	<i>Clupea harengus</i> . . .	Herring . . .		
	— <i>sprattus</i> . . .	Sprat . . .	North . . .	Idem.
	— <i>alosa</i> . . .	Shad . . .		
	<i>encrasiculus</i> . . .	Anchovy . . .		
	<i>Cyprinus barbus</i> . . .	Barbel . . .	Europe . . .	Coarse.
	— <i>carpio</i> . . .	Carp . . .		Ready of digestion.
	— <i>gobio</i> . . .	Gudgeon . . .		
	— <i>tinca</i> . . .	Tench . . .		Moderate.
	— <i>cephalus</i> . . .	Chub . . .		Coarse.
	— <i>leuciscus</i> . . .	Dace . . .		Good.
	— <i>rutilus</i> . . .	Roach . . .		
	— <i>aiburnus</i> . . .	Bleak . . .		Wholesome.
	— <i>brama</i> . . .	Bream . . .		

TABLE V.—Continued.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character as Food.
V. Chondropterygii.	<i>Accipenser sturio</i>	Sturgeon	Europe.	Nutritive.
	<i>ruthenus</i>	Starlet	—	Tender.
	<i>huso</i>	Isinglass fish	—	Coarse.
	<i>Squalus carcharias</i>	White shark	—	Idem.
	<i>Raia batis</i>	Skate	—	Indigestible
	<i>Petromyzon marinus</i>	Lamprey	—	
	<i>fluviatilis</i>	Lesser lamprey	—	
	<i>branchialis</i>	Lampern	—	

TABLE VI.
INSECTA.—Insects yielding Human Food.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character as Food.
Hemiptera.	<i>Gryllus migratorius</i>	Migratory locust	Africa	Moderate.
	<i>Cicada septendecim</i>	American	India	Idem.
Hymenoptera.	<i>Apis mellifica</i>	Honey bee	Generally	Yields honey.
	<i>Cancer mænas</i>	Common crab	Generally	Coarse.
Aptera.	<i>pagurus</i>	Black-clawed		Indigestible.
	<i>gammarus</i>	Lobster	—	
	<i>astacus</i>	Craw fish	—	
	<i>serratus</i>	Prawn	—	
	<i>cranjou</i>	Shrimp	—	
	<i>squilla</i>	White	—	Similar to lobster.

TABLE VII.
VERMES.—Worms sometimes Eaten.

Order.	Linnæan Name.	Common Name.	Where Eaten.	Character as Food.
Mollusca.	<i>Limax rufus</i>	Red slug	Generally	Nutritious.
	<i>Sepia sepiola</i>	Cuttle fish	—	Indigestible.
	<i>Echinus esculentus</i>	Edible sea urchin	—	
	<i>Pholas dactylus</i>	Dactyle pholas	Italy	Delicate.
Testacea.	<i>Cardium edule</i>	Common cockle	Generally	Nutritious.
	<i>Ostrea edulis</i>	Common oyster	—	Quick of digestion.
	<i>maxima</i>	Scallop	—	
	<i>Mytilus edulis</i>	Eatable mussel	—	Rich.
	<i>Helix pomatia</i>	Esculent snail	—	Nutritious.

With respect to animal food generally, it may be observed that venison seems to unite the qualities of being lighter and most nutritious of any; the flesh of young animals yields more gelatiné than that of the same animal in the adult state; that of wild animals is also sooner digested than that of domesticated ones. Salt meat is not so strengthening as fresh; and meat which has been kept for a short time, is considered to be more nourishing than that recently

killed. Even meat in a state of incipient putrefaction is more easily digested than that which is quite fresh: it does not follow, however, that it is more wholesome; and children universally reject it. Roast meat is considered to be more nutritious than boiled; for, by the process of boiling, much of the nutritious matter is evaporated. For CONDIMENTS and DRINKS, see those articles.

ALIMENTARI^{II} PUERI, &c. in Roman antiquity, were certain children maintained and educated by the munificence of the emperors, in public places, not unlike our hospitals. Trajan was the first that brought up any of these alimentary boys. He was imitated by Adrian. Antoninus Pius did the same for a number of maids, at the solicitation of Faustina, and hence, in some medals of that empress, we read *Puellae Favstianae*. Alexander Severus followed his example, at the request of Mammæa; and the maids thus educated were called Mammæanæ.

ALIMENTARY Duct, or **CANAL**, *ductus alimentalis*, is that part of the body through which the food passes, from its reception into the mouth, to its exit at the anus; including the gula, stomach, and intestines. The whole *ductus alimentalis* may be divided into four parts. 1. That which conveys the food, called the æsophagus. 2. That which digests, or corrodes it, called the stomach. 3. That which distributes the chyle, called the intestines. 4. That which discharges the faæces, called the rectum. This duct is said to be the true characteristic of an animal, there being no animal without it, and whatever has it, being properly ranged under the class of animals. Plants receive their nourishment by the numerous fibres of their roots, but have no common receptacle for digesting the food received, or for carrying off the recretions. But in all, even the lowest degree of animal life, we may observe a stomach and intestines, even where we cannot perceive the least formation of any organs of the senses, except the common one of feeling, as in oysters.

ALIMENTARY LAW, was an old law among the Romans, whereby children were obliged to find sustenance for their parents.

ALIMONY, **ALIMONIA**, in law, denotes that portion, or allowance, which a married woman sues for, upon any occasional separation from her husband, wherein she is not charged with elopement or adultery. It was anciently called *rationalib^e estoverium*, reasonable maintenance, and recoverable only in the spiritual court; but now it is recoverable also in chancery. When a woman is divorced à mensâ et thoro, she may sue her husband in her own name for alimony, or maintenance, out of her husband's estate, during the separation, either in chancery, or in the spiritual court.

ALIMOS, in botany, a name given by Greek writers to liquorice, from its quality of making the appetite insensible either to hunger or thirst.

ALINDA, **Ἀλινδα**, in ancient geography, a town of Caria, whose queen, Ada, adopted Alexander the Great as her son. A medal of this town represents a club, with a lion's skin, and within which, a crown of laurel, emblematical of Hercules; the inscription is **ΑΛΙΝΔΕΩΝ**.

ALINDESI^{IS}, or **ALINDES**, in the ancient gymnastic medicine, a kind of exercise, wherein persons being besmeared with oil, roll themselves naked in the dust.

ALINGSAS, or **ALINGSAHS**, an inland town of Sweden, in the province of Elsborg, where there are silk, woollen, tobacco, and pipe manufac-tories. Lon. 12°. 20'. E. lat. 50°. 30'. N.

ALIO D^EI, in mythology, the formula used by

the Augur when on religious grounds she dissolved the comitia or assemblies of the people, 'Quid gravius quam rem susceptam dirimi, si unus augur alio die dixerit.' *Cic. de Leg.*

ALIP/ENOS, or **ALIPANTOS**, from *ἀλίπαντος*, a negative, and *λιπανεύ*, to fatten, in the ancient physic, an appellation given to dry topical medicines, or such as have no fat mixed with them. It stands opposed to lipara, or plasters, which have fat in their composition; called also by Celsus, lenia. Galen gives the name *ἀλίπη* to the remedies which are applied to fresh wounds, in order to check the inflammation, and hasten their healing.

ALIPASMA, in ancient medicine, an ointment applied to the body to prevent perspiration.

ALIPEDE, from *ala*, a wing, and *pes*, the foot: nimble; swift-footed.

ALIPEE, a town of Cochin, in Hindostan, belonging to the rajah of Travancore. It is situated on a river communicating with that of Quilon, and is very populous, many merchants residing here who act as agents for houses at Bombay. Pepper, grain, and timber, are the chief exports. Lat. 9°. 42'. N.

ALIPILARIUS, or **ALIPILUS**, in antiquity, an officer belonging to the baths, who, by means of waxen plasters, took off the hairs from the alæ, or arm-pits. The alipilus answered to what the Greeks called *δρωπακτης*. The ancient Romans made it a point of cleanliness to keep the arm-pits clear and smooth; and in after times went farther, and took off the hair from their arms, legs, and other parts, with pitch, rosin, and the volsella, an instrument for that purpose.

ALIPIUS, bishop of Tagaste, in Africa, the countryman and intimate friend of St. Augustine, and, like him, at one time, a zealous Manichee. He accompanied him to Rome, where he studied law, and had some considerable employments. He embraced the Christian religion, and was baptized by St. Ambrose the same day with his friend Augustine. He afterwards went to Palestine, where he became intimate with St. Jerome. On his return to Africa, in 394, he was chosen bishop of Tagaste. He assisted at several councils, particularly that of Carthage, where he shewed his zeal against the Donatists, and died in 430.

ALIPIUS, in ancient history, a geographer of Antioch, and made governor of Britain, by the emperor Julian, to whom he dedicated a work on geography. He was afterwards exiled for following magical divinations.

ALIPOW, Montis Ceti, a kind of white turbit. It is found in several parts of Languedoc, particularly near Cete, whence its name of Montis Ceti. It is sometimes used instead of senna; but is a much stronger cathartic.

ALIPTA, from *ἀλιπτω*, I anoint, in the ancient gymnastics, a slave appointed to anoint the athlete. The aliptæ amount to the same with what are otherwise called unctores or jatraliptæ. The word is sometimes used for the director, or superintendant of the exercises of the athletes; in which sense, it is synonymous with *gymnastes*, or *pædotribæ*.

ALIPTERIUM, *ἀλιπτηριον*, in antiquity, the

place where the athleteæ were anointed before their exercises, otherwise called eleothesion, unctuarium, and sometimes also ceroma.

ALIQUANT PART, in arithmetic, that part of a given quantity which will not divide it exactly, or without remainder. It is opposed to the aliquot part of a quantity; thus four is an aliquant part of ten. The following are the aliquant parts of a pound English:

3s.	is an aliquant part	= $\frac{1}{10}$ th and $\frac{1}{20}$ th of 1l.
6s.	.	= $\frac{1}{5}$ th and $\frac{1}{10}$ th.
7s.	.	= $\frac{1}{5}$ th and $\frac{1}{10}$ th.
8s.	.	= $\frac{1}{4}$ ths.
9s.	.	= $\frac{1}{4}$ th and $\frac{1}{8}$ th.
11s.	.	= $\frac{1}{4}$ and $\frac{1}{20}$ th.
12s.	.	= $\frac{1}{4}$ and $\frac{1}{10}$ th.
13s.	.	= $\frac{1}{4}$, $\frac{1}{10}$ th, and $\frac{1}{20}$ th.
14s.	.	= $\frac{1}{4}$ and $\frac{1}{8}$ th.
15s.	.	= $\frac{1}{4}$ and $\frac{1}{4}$ th.
16s.	.	= $\frac{1}{4}$, $\frac{1}{8}$ th and $\frac{1}{16}$ th.
17s.	.	= $\frac{1}{4}$, $\frac{1}{8}$, and $\frac{1}{16}$ th.
18s.	.	= $\frac{1}{4}$ and $\frac{1}{16}$ ths.
19s.	.	= $\frac{1}{4}$, $\frac{1}{8}$, and $\frac{1}{16}$ th.

ALIQUOT PART, in arithmetic, that part of a given quantity which will equally and exactly divide it. It is opposed to the aliquant part; thus, four is an aliquot part of twenty. The following are the aliquot parts of a pound English:

10s.	.	= $\frac{1}{2}$ of 1l.
5s.	.	= $\frac{1}{4}$ th.
4s.	.	= $\frac{1}{5}$ th.
2s.	.	= $\frac{1}{10}$ th.
1s.	.	= $\frac{1}{20}$ th.
6s. 8d.	.	= $\frac{1}{4}$ d.
3s. 4d.	.	= $\frac{1}{8}$ th.
2s. 6d.	.	= $\frac{1}{10}$ th.
1s. 8d.	.	= $\frac{1}{20}$ th.
1s. 4d.	.	= $\frac{1}{16}$ th.
1s. 3d.	.	= $\frac{1}{12}$ th.
10d.	.	= $\frac{1}{2}$ d.
5d.	.	= $\frac{1}{4}$ d.

ALIRROTHIUS, a son of Neptune, killed by Mars for an attempt upon the chastity of Alcippe his daughter. Neptune cited Mars before him on the hill Areopagus, which derived its name from this circumstance.

ALISANDERS, or **ALEXANDERS**, in botany. See **SMYRNIUM**.

ALISANUS, in botany, the Rhexia virginica of Linnaeus. See **RHEXIA**.

ALISE, a small town of France, in the department of the Côte d'Or, or the Auxois, Burgundy, about twenty miles W. N. W. of Dijon. It stands on the site of the ancient **ALESIA**, which see.

ALISHUNG, or **ALISHUN**, a district of Afghanistan, in India, situated between the thirty-fifth and thirty-sixth degrees of north latitude, and sixty-eighth and sixty-ninth of east longitude, and surrounded by lofty mountains, generally covered with snow, whence the river Ali-shung has its rise. The chief town is Penjshehr.

ALISMA, or **WATER PLANTAIN**, so called from its supposed virtue in curing the bite of a sea-hare. It was also supposed to have the power of breaking the stone in the kidneys.—**GENUS**, polygynia: **CLASS** hexandria: **NATURAL ORDER**, Tetrapetaloidæ: **CAL**. a three leaved peri-

anthium: **COR**. three roundish, large, flat, expanding petals: **STAM**. six awl-shaped filaments, shorter than the corolla: **ANTH**. roundish: **PIST**. more than five germina: **STYLI**, simple: **STIG**. blunt; the seeds, small and solitary. Of this genus there are nine species, viz.: 1. *Alisma Cordifolia*, a native of America, found in stagnating waters, 2. *Alisma Damasonium*, or star headed water plantain, a native of Britain. 3. *Alisma Flava*, or yellow water plantain, a native of America, grows in swamps. 4. *Alisma natans*, or creeping water plantain, a native of Britain. 5. *Alisma Parnassifolia*, a native of America, found in boggy ground. 6. *Alisma plantago*, or great water plantain, grows in all the marshy parts of Scotland. 7. *Alisma ranunculoides*, or lesser water plantain, also a native of this country. 8. *Alisma subulata*, a native of America. 9. *Alisma repens*, a native of Spain, growing on the banks of the Manzanares.

ALISO, in ancient geography, a river of Germany, which flows into the Lippe, not far from Paderbon. It is now called Alme. Pliny also mentions a place near the Rhine by the name **Alaeorov**.

ALISONTIA, or **ALISUNTIA**, in ancient geography, a river of Belgic Gaul, now Alsetz; which, rising on the borders of Lorrain, and running through the duchy, waters the city of Luxemburg, and falls into the Sur.

ALITE'. A little.

He rested bot a lite, a sonde pe Inglis him sendes.

R. Brunne, p. 81.

For leuth well and sooth is this
That whan I knowe all howe it is,
I woll but forthren hem alite.

Gower. Con. A. book ii.

ALITES, in ancient mythology, birds which afforded auguries by their flight, in distinction from oscines, or those which gave auguries by singing or croaking, &c. To the class of alites belonged the buzzard, osprey, &c. To that of oscines, the crane, raven, owl, &c.

ALJUBARROTA, a market town in the district of Leira, Portuguese Estremadura, containing about 1600 inhabitants. It is ten miles north of Leira.

ALJUSTREL, a town of Portugal, in the province of Alentejo, 16 miles from Beja, containing 1,500 inhabitants. There is another town of this name in Estremadura, four miles from Thomar.

ALIVE'. On live. In life. See **LIFE**.

Our quene pat was pen dame Helianore his wife
pe gode, erle of Warenne, Sir Hugh was pan o' life.

R. Brunne, p. 213.

For as the fishe, if it be drie,
Mote in defaute of water die;
Right so without aire, on liev
No man, ne beast, might thriue.

Gower. Con. A. book vii.

Nor well alive, nor wholly dead, they were;
But some faint signs of feeble life appear. *Dryden*.
Not youthful kings, in battle seiz'd alive;
Nor scornful virgins, who their charms survive. *Pope*.

And to those brethren said, rise, rise by-live;

And unto battle do yourselves address:

For yonder comes the prowest knight alive,

Prince Arthur, flower of grace and nobility.

Faerie Queens

The earl of Northumberland, who was the proudest man *alive*, could not look upon the destruction of monarchy with any pleasure. *Clarendon.*

John was quick, and understood business; but no man *alive* was more careless, in looking into his accounts. *Arbuthnot.*

Contemn thou while thou art *alive*, that, which thou canst not enjoy, when thou art dead.

Bp. Hall's Remedy of Discontentment.

His soul, where moral truth spontaneous grew,
No guilty wish, no cruel passion knew;
Though tremblingly *alive* to nature's laws,
Yet ever firm to honour's sacred cause.

Falconer's Shipwreck.

ALKA, the auk. See ALCA.

ALKADARI, from Akladar, Arab. a decree, a sect of the Mahomedans, who deny any eternal, fixed, divine decrees; being asserters of free will. They are a branch of Moatalites, and stand opposed to the Algiabarii.

ALKAHEST, in alchemy, compounded of al and geest, Germ. i. e. all spirit, according to Paracelsus and Van Helmont, is a certain fluid in nature, capable of reducing all sublunary bodies, into their *ens primum*, or original matter or into an uniform portable liquor, that will unite with water, and the juices of our bodies. Van Helmont, declaring that he himself possessed the secret, excited succeeding chemists and alchemists to the pursuit of so wonderful a menstruum; and Mr. Boyle is said to have declared that he had rather have been master of it than of the philosopher's stone. The different conjectures of chemists, with regard to the matter of the alkahest, are innumerable; some expected to obtain it from sea-salt and mercury; others wrought on equinoctial dew; others on rain-water, others on talc, on zinc, on antimony, &c. &c. But Kunkel very properly asks, If the alkahest dissolves all substances, in what vessel can it be contained? Alkahest is used in a more extensive sense for all fixed salts volatilized, and reduced into a quintessence.

ALKAKENGLI, or winter cherry, the fruit of a species of nightshade.

ALKAKENGI, in medicine, is used as an astringent, dissolvent, and diuretic, and is celebrated for its lithontriptic quality; it is also prescribed to cleanse the urinary passages in the gravel, and other obstructions. Its detergative quality also recommends it against the jaundice, and other disorders of the viscera.

ALKALI, in botany. See KALI and SALICORNIA.

ALKALL, a term in chemistry applied to an order of salts of considerable importance. It has been traced by some to the Arabic word, alkhalet, burnt; but it is more generally derived from the word kali, the name of a plant, from the ashes of which one species of alkali can be extracted. The substances that are met with under the denomination of alkaline, are possessed of certain properties of a peculiar kind; they are mainly characterized, however, by a power of combining with acids in such a manner as to impair the activity of the latter, so that alkalis, as chemical agents, are distinguished by properties the reverse of acids; acids and alkalis being thus generally considered as antagonist principles.

But besides the power of neutralizing acids, and thereby forming certain saline substances, the alkalies are further distinguished by the following properties:

First, they have an acrid taste, and corrosive power when applied to some substances; thus proving caustic to the skin and tongue.

Secondly, They change the blue colour of vegetables to a green, the red to purple, and the yellow to a reddish brown. If the purple have been reddened by acid, alkali will restore the original colour.

Thirdly, They are almost unlimitedly soluble in water; that is, they combine with it in every proportion.

Fourthly, They unite with oils and fats, and form by this union the well-known compound called soap.

There is another class of substances which have a strong analogy with alkalies, especially in reference to their opposition to acids, viz. the earths; these indeed by Fourcroy were arranged among the alkalies, but they have been kept apart by other systematic writers, on the ground of the analogy between the one and the other being far from amounting to an identity of essence and peculiar property.

The true alkalies have been arranged by a modern chemist into three classes.

First, Those which consist of a metallic basis, combined with oxygen. These are three in number, potash, soda, and lithia. Secondly,

That which contains no oxygen, viz. ammonia.

Thirdly, Those containing oxygen, hydrogen, and carbon. In this class are placed aconita, atropia, brucia, cicuta, datura, delphia, hysocynamia, morphia, strychnia. And it is supposed that the order of vegetable alkalies, may by subsequent discoveries, be proved as numerous as the vegetable acids. The original distribution of alkaline substances was into volatile and fixed—the volatile alkali being known under the name of ammonia, while one of the fixed was called potash or vegetable, because procured from the ashes of vegetables generally—the other soda, or mineral, on account of its having been principally obtained from the incineration of marine plants.

In respect to the principle of alkalescence generally, this, like that of acidity, has recently been the subject of an investigation, which has led to very important inferences. Alkalies and earths, it has already been said, display in their relations to acids, considerable analogy; and the substances that are known under the denomination of metallic oxydes, have nearly the same connexions. Now the constitution of these last having been ascertained, it might have been fair to suppose that the former are of a similar nature; but their real composition was not at all understood, until the splendid discoveries of Sir H. Davy, who, having submitted potash and soda to the action of a powerful galvanic battery, observed that at the negative pole globules were collected, having metallic lustre, while at the positive side, a gas was disengaged, which proved to be oxygen. These results, Sir H. D. fairly inferred, arose from the decomposition of the alkalies, which he thence considered as com-

pounds of metallic substances with oxygen; and thus has for ever been banished the hypothetical principle of Morveau, who conceived hydrogen to be the principle of alkalescence as Lavoisier had judged oxygen to be the essence of acidity. But although, so far, both the analytic and synthetic experiments are complete and satisfactory in relation to the components of alkalies, we must not push the inference to too great an extent; for ammonia seems to shew that the alkaline principle may exist independent of oxygen; nor is there at present any proof that metallic matter constitutes the base of this last-mentioned substance.

Analysis and synthesis have, however, gone far enough to prove, that in the composition of the acids and alkalies, there is some sort of analogy, or rather to show that it is the mode in which the constituents of each are united, rather than the nature of the constituents themselves, which gives rise to the acid or alkaline condition. According to Dr. Murray, indeed, ‘the class of alkalies will exhibit the same relations as the class of acids.’ ‘Some,’ he says, ‘are compounds of a base with oxygen, such are the greater numbers of the metallic oxides, and probably of the earths. Ammonia is a compound of a base with hydrogen. Potash, soda, barytes, strontites, and probably lime, are compounds of bases with oxygen and hydrogen; and these last, like the analogous order among the acids, possess the highest powers. Acidity, he says, is produced in a higher degree by the joint action of oxygen and hydrogen, than by the operation of hydrogen alone. A similar result, there is reason to conclude, exists in their relations to alkalinity. The most powerful alkalies, potash and soda, and the earths which have the highest degree of alkaline energy have been supposed to contain water in considerable proportion, in intimate combination, in their insulated form. There is every reason to draw the same conclusion with regard to this; as with regard to the supposed pressure of combined water in the stronger acids. It is probable that the elements rather exist in the combination; and thus the alkalies, applying the term in its most extensive signification, to denote those substances which neutralize acids, display the same relations as acids.’ But against this elementary hypothesis of Murray, Dr. Ure starts objections somewhat similar to those he had urged in reference to the principle of acidity; and we shall conclude the present article, by extracting the observations made by Dr. Ure on this head.— ‘Surely,’ says he, ‘perfectly dry and caustic barytes, lime, and strontites, as well as the dry potash and soda, obtained by Gay Lussac and Thenard, are not inferior in alkaline power to the same bodies after they are slackened or combined with water: 100 parts of lime destitute of hydrogen, that is pure oxide of calcium, neutralize seventy-eight parts of carbonic acid. But 132 parts of Dr. Murray’s strongest lime, that is the hydrate, are required to produce the same alkaline effect. If we ignite nitrate of barytes, we obtain, as is well known, a perfectly dry barytes or protoxide of barium; but if we ignite crystallized barytes, we obtain the same alkaline earth, combined with a prime equivalent of

water.’ These two different states of barytes were demonstrated by M. Berthollet, in an excellent paper published in the second volume of the Mémoires D’Arcueil, so far back as 1809:— ‘The first barytes,’ says he, ‘presents all the characters of a combination; it is engaged with a substance which diminishes its action on other bodies, which renders it more fusible, and which gives it by fusion the appearance of glass. This substance is nothing else but water; but in fact, by adding a little water to the second barytes, (that from ignited nitrate, as opposed to that from crystallized barytes,) and by urging it at the fire, we give it the properties of the other.’ 100 parts of barytes void of hydrogen, or dry barytes, neutralize $28\frac{1}{2}$ of dry carbonic acid. Whereas $111\frac{1}{2}$ parts of the hydrate, or what Dr. Murray has styled the most energetic, are required to produce the same effect. In fact, it is not hydrogen which combines with the pure barytic earth, but hydrogen and oxygen in the state of water. The proof of this is, that when carbonic acid and that hydrate unite, the exact quantity of water is disengaged. The protoxide of barium or pure barytes, has never been combined with hydrogen by any chemist. For an account of the different alkalies, see under their respective names, and also the article CHEMISTRY.

ALKALIMETER, in chemistry, a scientific instrument invented by Descroizelles to measure the purity of different alkalies; it acts by ascertaining how many times their own weight they require in sulphuric acid to complete their saturation.

ALKANET, in botany. See ANCHUSA.

ALKENDI, (Jacobus,) a celebrated Arabian philosopher, born at Balsora, in the beginning of the ninth century. Alkendi appears to have studied philosophy with attention and success. He explained the writings of Aristotle to the schools, and obtained so much celebrity that Cardan ranks him as one of the first twelve sublime spirits of the world. His moderation is greatly exemplified by the following anecdote related of him by Abulfaragius. Alkendi having endeavoured to explain the doctrines of the Alcoran, as consistent with the principles of philosophy, was accused by one Abu-Maasher, an advocate for the vulgar interpretation, of impiety. Instead of using his influence with the caliph to silence this bigot, he procured a person to teach him philosophy, and by his kindness won him to become one of his most zealous disciples. Alkendi’s principal works are a treatise entitled De Temporibus et Mutationibus. 2. De Gradibus Medicinarum compositarum investigandis. 3. De Ratione sex Quantitatibus. 4. De Quinque Essentiis. 5. De Motu Diurno. 6. De Vegetabilibus. 7. De Theoria Magicarum Artium.

ALKERMES, in medicine, a term borrowed from the Arabs, denoting a celebrated remedy, of the consistence of a confection; whereof the kermes berries are the basis. The other ingredients are pippin-cyder, rose-water, sugar, amber-grease, musk, cinnamon, aloes-wood, pearls, and leaf-gold; but the sweets are usually omitted. The confectio alkermes is chiefly made at Montpelier. The grain which gives it the denomination, is no where found so plentifully as there.

ALKIBRIC, in chemistry, sulphur vivum.
ALKIN, in chemistry, pot-ash.

ALKIR, in chemistry, smoke of coal.
ALKORAN. See ALCORAN.

ALKUSSA, in ichthyology, a name given by the Swedes to the fish which they also call lake. It is a species of the silurus, distinguished by Aredi as the silurus with one cirrus, or beard under the chin; the common silurus, the glanis of the ancients, having four cirri.

ALL, *n. adj. & adv.* Gothic, *alle*; *Æll*, alle, Sax. Old Welsh; *al*, Dutch; *alle*, German; *ωλς*, Gr. The whole number; every one, taken together; quite; completely. In our old writers it may be often considered expletive, or emphatic. It is found, in composition, without changing the sense of the word, to which it gives additional force.

He sent for *alle* pe kynges fro Berwick vnto Kent,
And pei with fulle gode wille *alle* vnto him went.

R. Brunne, p. 19.

And who ever wole be the firste among you schal be
servaunt of *alle*. *Wicklif. Mark*, x.

Six dayes thou shalt labour, and do *all* thy work.

Deut. v. 13.

All the fitter, Lentulus; our coming
Is not for salutation; we have bus'ness.

Ben Jonson.

When I shall wed,

That lord, whose hand must take my plight, shall
carry

Half my love with him, half my care and duty:

Sure, I shall never marry, like my sister,

To love my father *all*. *Shaksp. King Lear.*

Then shall we be news-cramm'd.—*All* the better;
we shall be the more remarkable. *Shaksp.*

Up, with my tent; here will I lie to-night:

But where, to morrow?—Well, *all's* one for that.

Shaksp.

Brutus is an honourable man:

So are they *all*; *all*, honourable men.

Shaksp. Julius Caesar.

To graze the herb *all* leaving,

Devour'd each other. *Milton's Parad. Lost.*

Sceptre and pow'r, thy giving, I assume:

And glad, her shall resign; when, in the end,

Thou shalt be *all* in *all*, and I in thee,

For ever; and in me, all whom thou lov'st. *Milton.*

I am of the temper of most kings; who love, to be
in debt; are *all* for present money, no matter how
they pay it afterward. *Dryden.*

No more with fruitless care, and cheated strife;
Chase fleeting pleasure through the maze of life;
Finding, the wretched *all* they here can have,
But present food, and but a future grave. *Prior.*

Ye sons of men, with just regard attend,
Observe the preacher, and believe the friend,
Whose serious muse inspires him to explain,
That *all* we act, and *all* we think, is vain.

Prior's Solomon. Knowledge.

Our *all* is at stake, and irretrievably lost, if we fail
of success. *Addison.*

Thus let me hold thee to my heart,

And ev'ry care resign;

And shall we never, never part,

My life—my *all* that's mine.

Goldsmith's Hermit.

ALL-FOURS, a game of cards played by two persons; so called from the four sorts of cards, called high and low, jack of trumps, and the game, which, joined in the hand of either party, constitute him the winner.

VOL. I

ALL-GOOD, in botany, the chenopodium or bonus henricus, of Linnaeus, so called because it is applied by common people to heal slight wounds.

ALL-HALLOW FAIR, an annual fair held in Edinburgh, beginning the second Monday of November, and lasting a week, chiefly for black cattle and horses.

ALL HANDS HOAY, in sea language, the order by which the ship's company is summoned on deck by the boatswain. *All hands to quarters hoay*, is the order to the crew for preparation for battle. This command is more generally given by the boatswain piping down the hatchway.

ALL IN THE WIND, the state of a ship's sails when parallel to the direction of the wind, so as to shake and shiver, by turning the ship's head to windward, either by design, or neglect of the helmsman.

ALL-HEAL, in botany, the stachys of Linnaeus. See STACHYS.

ALL-SAINTS, a festival, called also All-Hallows, celebrated on the first of November, in commemoration of all saints in general. The number of saints being excessively multiplied, it was found too burdensome to dedicate a feast day to each; there being, in fact, scarce hours enough in *the* year for this purpose. It was therefore resolved to commemorate, on one day, all who had no particular days. Boniface IV. in the ninth century, introduced the feast of All-Saints in Italy, which was soon after adopted into the other churches.

ALL-SAINTS ISLANDS, a small group of islands lying near Guadalupe, in the West Indies.

ALL-SAINTS, a large convenient bay on the coast of Brazil, province of Bahia. It is thirty-seven miles from north to south, and twenty-seven from east to west. Its entrance is about eight miles from point Tagapipe to that of San Autonio. In this bay vessels are sheltered from every wind in clear ground, and there is ample space for an immense number of ships to harbour here without confusion. There are many smaller bays in it, convenient for careening vessels, and also many fertile islands. On the west side are two shoals, which, however, are not dangerous, sufficient space being left for the passage of vessels, without approaching them. Several rivers fill into this bay, the principal are Paraguasu, Sergippe, Jaguaripe, Matuim, Paranamerin, and Piraja. This capacious lake or inland sea, as it might be called, is surrounded by a rich and fertile country, the neighbouring shores being covered with sugar plantations, the productions of which are conveyed in large barges by the rivers. The trade has greatly increased since the commercial treaty concluded with great Britain, after the royal family of Portugal quitted Europe. The surrounding coast abounds with whales; a few large boats are employed in this fishery; but the oil procured is hardly equal to the consumption. The eastern part of the bay lies in long 38°. 42'. W. lat. 12°. 42'. S.

ALL-SAINTS (bay of), a deep bay on the coast of New California, or New Albion. Point Græjero, its northern promontory, is situated in long 243°. 34'. E. lat. 31°. 43'. N.

ALL-SEED, in botany, a name given to the

2 T

Chenopodium polyspermum, or *linum radiola* of the Linnean system.

ALL-SOULS DAY is a festival held in commemoration of all the faithful deceased; first introduced in the eleventh century, by Odilon, abbot of Cluny, who enjoined it on his own order; and soon after adopted by the neighbouring churches.

ALL-SPICE. See *MIRTUS PIMENTO*.

ALLA, or **ELLI**, the first king of Sussex, who landed in England with a Saxon army, in 477, and having made himself master of that part of the country, erected it into a kingdom, and died in 514, after a reign of twenty-three years. *Polyd. Virg.*

ALLA, or **ALLAH**, the name by which the professors of Mahomedanism call the Supreme Being. The word is Arabic, derived from the verb alah, to adore. It is synonymous with the Hebrew Eloah, which signifies the Adorable Being.

ALLAGITE, in mineralogy, a carbo-silicate of manganese.

ALLAHABAD, a province of Hindostan, lying between the twenty-third and twenty-sixth degrees of north lat., and the seventy-ninth and eighty-third of east long. It is bounded on the north and north-west by the provinces of Oude and Agra; on the east by Bahar and Gundwana; on the south by Gundwana and Berar; and on the west by Agra and Malwah. Its greatest length is about 250 miles, and its breadth about 120 miles, comprehending, according to the arrangement of the *Ayeen Akberry*, ten circars, or counties, and 177 pergunnahs, or hundreds; and capable, at the time of the completion of that celebrated volume, of yielding 11,375 cavalry, 237,870 infantry, and 323 elephants. The chief towns are Allahabad ('the House of God,' or 'King of Adorable Places,' as it signifies); Benares, the ancient seat of Brahminical learning, Callingur, Chunar, Chatterpore, Ghazypore, Joanpour, and Mirzapour; and it is well watered by the Ganges, the Jumna, and their various tributary streams. A large portion of the inhabitants are native Hindoos, and the rest, perhaps one-eighth, Mahomedans.

On the dismemberment of the Mogul empire, in 1740, this province was seized by Mahomet Kooli, an ally of the Zainindar of Benares, with whom he entered the Bengal provinces, in 1760, at the head of 60,000 men. The British, then acting as allies of the nabob of Bengal, conducted an inferior force to meet him, to which he was ultimately obliged to surrender himself; and this district, with that of Corah, was again ceded to the mogul, the emperor having the fort of Allahabad for his residence. In return, he confirmed the rights of the British to their territorial acquisitions on the coast of Bengal, the great foundation of the British power in India. Of the Benares part of this province, the British obtained possession on the death of Sujah Dowlah, in 1775; of the capital and central districts in 1801; and of Bundelcund, and the southern parts of the province, by treaty with the Paishwa of the Poonah Mahrattas in 1803.

The diamond mine at Pannah, in this province, was formerly considered the most remarkable mine in India, and seems to have been

known to Ptolemy. It was a source of considerable revenue to the emperor Acber, as well as to the native chiefs of Bundelcund, where it is situated. To the former, it yielded eight lacks of rupees annually. In 1756 it was considerably exhausted, and only yielded four lacks of rupees to the rajah. Latterly it has excited little attention, and, we therefore conclude, affords but little profit. Muslims, cotton, opium, indigo, salt-petre, sugar, grain, and a great variety of fruits, form the other produce of Allahabad. The population is said to exceed seven millions.

Allahabad is, on the whole, one of the most productive provinces of Hindostan. In the neighbourhood of the river, particularly, wheat flourishes exceedingly well, and will yield seven quarters per acre. Land is rented here at about a pound an acre. Ploughing is begun at the commencement of the rainy season, in June; but the land is only turned up once until the rains cease. It is then ploughed fourteen or fifteen times before it is thought fit for the seed. But a still more laborious occupation of the agriculturist is to keep it watered in the dry season, a task which will employ four bullocks and three waterers, for nine days, on a single acre. They sow in September and October, after rains, peas, barley, and oil crops with the wheat.

In the province of Allahabad are two famous resorts of Hindoo superstition, Benares and Pragaya (Allahabad), which have for ages attracted their thousands from all parts of India.

The Bundelcund portion of this province rises to the south-west in elevated table lands, which abound with fortresses, but are very ill cultivated. Here the climate is as delightfully temperate, as in the flatter and more fruitful districts; it is insupportably sultry to Europeans. This part of the province has no considerable streams, and principally depends for irrigation on the periodical rains. There is a small breed of sheep cultivated in this district, the fleece of which is used as a rug for the shepherds, it being wholly unfit for weaving.

ALLAHABAD, the capital of the province of that name, is situated near the junction of the Jumna and the Ganges. It is divided into two parts, the Old Town and the New. The former stands on the site of the ancient town of Praeg, or Bhat Prayag, held in the highest veneration throughout Hindostan; so that notwithstanding all its changes of masters and of appearances, Allahabad is still the resort of numerous pilgrims, who come hither to offer their devotions to the Ganges and perform their ablutions in its waters. The surrounding country, to the extent of forty miles, is esteemed by these devotees as a sort of holy ground. This ancient part is mainly distinguished by the magnificent ruins of a fortress of stone, erected here by the emperor Acber. The walls are said to have been forty feet high throughout, including a number of elegant courts and domes. In the centre, a column of one stone, nearly forty feet high, is still standing, which records the honours of the emperor, in Sanscrit and Persian, the date of the building, 1583, &c. There is an extensive subterraneous cave in the middle of this fort, supported by

pillars, in which some of the most important rites of the Hindoo devotees are performed. It is said to extend under ground to Delhi. We should not omit to notice, that Dr. Robertson regards this place as occupying the situation of the palibothra of Strabo and Arrian, the celebrated capital of the Prasii.

On the sides that are presented to the two rivers, the fort retains its old walls, which are mounted with some pieces of cannon. The other side has three regular modern ravelins, two bastions, and a half bastion, whose foundations are much higher than the surrounding country. There is a spacious government house within the walls, containing some elegant rooms that overhang the river, and an extensive barrack.

The modern town is the residence of a British judge, and of the collector of the province. Population about 20,000. The fort stands in north lat. $25^{\circ} 27'$. and east long. $81^{\circ} 50'$. at about fifty-three miles from Benares, and 550 from Calcutta.

ALLAHABAD, is also the name of a district surrounding the above city, and contains some of the most fertile lands of the province.

ALLAH-SHEHR, i. e. CITY OF GOD; a town of Natolia, in Turkish Asia, the Philadelphia of the ancients. It contains some few remains of its ancient strength and importance; particularly portions of the strong walls and towers with which it was once encompassed. The inhabitants, however, are not very numerous: they are a mixture of Turks and Greeks; but during the passage of the caravans to and from Smyrna, (distant about five days' journey,) the town is much frequented. The Greeks are said to amount to about three hundred and ten families, living on friendly terms with the Mahomedans. Here is a lofty and beautiful cathedral for the use of the Greeks. Besides which, they have upwards of twenty inferior churches, though few in a state fit for public worship. This town is about five leagues from Sardis, or Sart.

ALLAMANDA, in botany; a genus of the monogynia order, and pentandria class of plants. Characters: CAL. one-leaved perianth. COR. one funnel-shaped petal: TUBE, cylindric: BORDER semiquinquefied and verticose; divisions expanding and obtuse: STAM. filaments scarce any: ANTH. five arrow-shaped, converging in the throat of the tube: PIST. oval germen, girt at the base with an annular margin; stylus uniform, the length of the tube: STIGM. headed and contracted in the middle: PER. is an orbicular, compressed, bristly capsule, containing one cell with two valves: the seeds are imbricated, orbicular, flat, with a membranous wing on the margin, and are very numerous. There is but one species, viz. *allamanda cathartica*, a native of Surinam.

ALLAMPARVA, a fort on the coast of the Carnatic, Hindostan, originally presented by the native powers to the French, by whom it was ceded to the British in 1760. It is sixty-seven miles south by west from Madras. North lat. $12^{\circ} 10'$. east long. $80^{\circ} 7'$.

ALLAN, a river of Perthshire, which rises near Gleneagles, in the parish of Blackford, runs west through Strathallan, and, after passing Dum-

blane, falls into the Forth, a mile above Stirling bridge.

ALLAN, (David,) a Scottish portrait and historical painter of the eighteenth century, was born at Edinburgh. After a long course of study at Rome, he was, in 1780, appointed master of the academy established in Edinburgh for diffusing the knowledge of the fine arts. There are several engravings from his pictures, one of which, entitled the Origin of Painting, or the Corinthian Maid, drawing the shadow of her lover, is well known and justly appreciated. He died in 1796.

ALLAN, (George,) an attorney and antiquary of Darlington, in Yorkshire, who died in 1800. He had a printing-press in his own house, and issued many curious tracts, as, The Letter of Cromwell to William Lenthall, Esq. speaker of the House of Commons, for erecting a College and University at Durham, &c. 4to. Mr. Allan liberally communicated MSS. to the completion of a civil and ecclesiastical history of the county palatine of Durham, having presented to the Society of Antiquaries of London twenty-six quarto volumes of MSS. chiefly gathered by the Rev. William Smith, of University College, Cambridge, and formerly rector of Melsonby, Yorkshire.

ALLANITE is a mineral first recognised by Mr. Allan of Edinburgh. Its analysis and description, by Dr. Thomson, were published in the sixth volume of the Edinburgh Philosophical Transactions. M. Giesecke found it in a granite rock in West Greenland. It is massive and of a brownish-black colour. External lustre, dull; internal, shining and resinous—fracture small conchoidal—opaque—greenish-grey streak—scratches glass and hornblende—brittle—spec. grav. 3.5 to 4.0. Froths and melts imperfectly before the blow-pipe, into a black scoria. It consists in 100 parts, of silica 35.4, oxide of cerium 33.9, oxide of iron 25.4, lime 9.2, alumina 4.1, and moisture 4.0. It has been also found crystallized in four, six, or eight sided prisms. It closely resembles gadolinite, but may be distinguished from the thin fragments of the latter, being translucent on the edges, and of a fine green colour, whereas those of the former are commonly opaque and of a yellowish brown. The ores of cerium analyzed by Berzelius, under the name of cerin, approach very closely to it in their composition.

ALLANTODIA, in botany, from *αλλατος*, *ἀλλατος*, a sausage, so called from the tumid oblong figure of the sori or lines of capsules, wrapped within their membranous covering. Class and order, cryptogamia, filices. NAT. ORD. filices. ESS. CHAR. fructification in scattered oblique lines accompanying a vein, involucrum vaulted, originating laterally from the vein, and inserted into it by both margins; at length separating at the inner one. The habit of this genus, says Mr. Brown, is between nephrodium and diplazium. Polypodium umbrosum Hort. Kew. ed. 1, affords an example of it, and there are some unpublished species. We are acquainted with.

A. umbrosa. Madeira wood sausage-fern. Frond triply pinnate; ultimate segments lan-

ceolate, decurrent, deeply serrated ; the lower serratures cloven. Lines contiguous; finally confluent.—Gathered in shady woods in Madeira, by the late Mr. Masson, who sent roots to Kew, in 1779, and gave specimens to the younger Linnaeus. *A. australis*. Southern sausage-fern. Br. n. 1.—Frond doubly pinnate, deltoid, membranous, flaccid. Leaflets pinnatifid, tapering at the point; lobes oblong, obtuse, deeply serrated, many-flowered. *Involucrum* oblong.—Native of Van Diemen's island.—*A. tenera*. Tender sausage-fern. Br. n. 2—Frond doubly pinnate, membranous, flaccid. Leaflets pinnatifid; lobes oblong, obtuse, serrated, flowering at the base. Spots linear.—Gathered by Mr. Brown, in the neighbourhood of Port Jackson, New South Wales. The *Aspidium axillare*, Willd. Sp. Pl. v. 3. 278. Ait. ed. 2. v. 5. 512, should seem, if the specific character of Willdenow were right, to belong to the present genus.

ALLANTOIS, in anatomy, a urinary membrane so called from its resemblance to a pudding. It makes a part of the secundine, appearing differently in different animals, and most conspicuously in the cow and sheep kind. Its length in the former extends to about twelve feet. It is very dilatable, and may be blown up to above a foot diameter. The inhabitants of Iceland make use of it, instead of glass, for windows.

ALLASIA, from *αλλαγ*, a sausage, or black-pudding, in reference to the shape and colour of the fruit. Class and order, tetrandra, monogynia. General Character : CAL. one leaf, inferior; TUBE, short : LIMB, in five, rather acute, hairy segments : COR. superior, of four small, concave and very hairy petals : STAM. Filaments four, awl-shaped, thick, the length of the calyx : ANTHRIA, inverted, two-lobed, each lobe two cells : PIST. Germen roundish, between the calyx and the corolla : STYLE, awl-shaped, length of the stamens : STIGM. acute : PERIC. berry large, oblong, obtuse, smooth, fleshy, pendulous, one cell. Seeds numerous, ovate, tumid, somewhat compressed and imbedded in pulp. Ess. Char. Berry with numerous seeds : GERM. between the five-cleft calyx : COR. four petals. Its common name is the black-pudding tree, or muringuirue of the Africans. It was first observed by Loureiro, at Mozambique, near the eastern coast of Africa. It is a large tree, with spreading branches, destitute of thorns.

ALLAT, from Allah, God, Arab. the name of an idol among the Arabians and idolatrous Jews.

ALLATIUS, (Leos) a native of Scio, keeper of the Vatican library, and a celebrated writer of the seventeenth century. He assisted the gentlemen of Port Royal in their controversy with M. Claude, respecting the belief of the Greeks as to the Eucharist. He was devoted to the see of Rome, and inveterate against the Greek church, in which he had been educated. He never engaged in matrimony, nor entered into orders. Pope Alexander VII. having asked him one day, why he did not enter into orders; he answered, 'Because I would be free to marry.' The Pope rejoined, 'If so, why do you not marry?' 'because,' replied he, 'I would be at liberty to take

orders.' Patricius says, that Allatius had a very extraordinary pen, with which he wrote Greek for forty years; and when he lost it, he lamented it with tears. He published several translations of Greek authors, and some pieces of his own, the principal of which are, *De Ecclesia Occidentalis et Orientalis perpetua Concione*, *On Purgatory*, *De Patria Homeri*, *De septem orbis Spectaculis*, *Confutatio Fabule de Joanna paissa*, *De Georgiis*, *De Simeonibus*. He died at Rome in 1669, aged 83.

ALLAY, *v. & n.* Supposed to be derived **ALLAYER**, from *allegge*, with the *g* **ALLAMENT**, softened into *y* from *Alegyan*, **ALLOY**, to lay: to put down; to ease; to soothe; alleviate; lessen; reduce. To abate the force or strength of the predominant material with which something is made; as in *alloy*, immediately from the French *aloyer*.

If he no lusty thought assaye,
Whiche maye his sory thurst *allaye*,
As for the tym yet it lesseth
To hym, whiche other ioye misseth.

Gower. Con. A. book vi

For if that they were put to swiche assayes,
The gold of hem hath now so bad *alayes*,
With bras, that though the coine be faire at eyne,
It wolde rather brast atwo than plie.

Chaucer. The Clerkes Tale, v. i. p. 363.

When flowing cups run swiftly round
With no *allaying* Thames,
Our careless heads with roses bound,
Our hearts with loyal flames:
When thirsty grief in wine we steep,
When healths and draughts go free,—
Fishes, that tipple in the deep,
Know no such liberty.

Rd. Lovelace in Ellis, v. iii. p. 277.

But thou'lt say
There were some pieces of as base *alay*
And as false stamp there, parcels of a play,
Fitter to see the fire-light than the day:
Adultrate monies, such as would not go.

Ben Jonson. Underwood's. On Vulc.

Gold incorporates with lead in any proportion; so it does with copper, which is its common *alloy*; it likewise incorporates with brass and tin, which was the ancient *alloy*. *Bacon's Nat. and Exper. Hist.*

Phlegm and pure blood are reputed *allayers* of acrimony. *Harvey on Consumptions.*

I will purge in the furnace thy dross;
And I will remove all thine *alloy*.

Louth's Isaiah. Preliminary Dis.
Yet leave me not! I would *alay* that grief,
Which else might thy young virtue overpower,
And in thy converse I shall find relief
When the dark shades of melancholy lower.

Beattie's Minstrel, b. ii.

ALLAZÆZIS, among chemists, denotes a philosophical brass or copper, called also *alum*, *aqua mercurii*.

ALLE, a river of Prussia, which falls into the Pregel, near Wehlaw.

ALLE, a species of auk. See *ALCA*.
ALLECT, Ad: *lacio, lectum*, to **ALLECTIVE**, *n. & adj.* draw to; to attract, al-
ALLIGENT, lure, entice, seduce; to
ALLIGENCE, gain over by stratagem.

Consider what is root and ground
Of thy mischief, which is plainly found

Woman farced with fraud and disceipt
To thy confusion most *allective baite*.

Chaucer. The Remede of Lore, fol. 323. c. i.

They made so cruell and deadly warre, that not
lyke men, whose nature is to be satisfied with the
slaughter of men, and to be merciful to the impotent
and sycke persons, brent tounes, spoyle houses, and
killed me and children, and *allected* with the sweet-
nes of spoyle and prayes, wasted all the countrey of
Northumberlād.

Hall. Hen. VII. fol. 50.

But among all things, the very deadly pestilēce
is this : to be coutersaūt daie and night among them,
whose life is not only on every side an *allective* to
syne ; but ouer that all set in the expugnacion
of vertue. *Sir Thomas More's Workes*, p. 12. c. i.

ALLECTOR, a species of CRAX, which see.

ALLECTUS, in ancient history, a prætorian prefect, who, having killed Carausius in Eng-
land, took possession of his throne, which he held
from 294 to 297 ; when Constantius Cæsar
landing in Britain with an army, Allectus was
killed in an engagement which ensued. Medals
are still extant bearing his effigy.

ALLEGANY COUNTY, a county of the
state of New York, in North America. It was
erected from Genesee county in 1806, is about
forty miles north and south, and twenty-eight
east and west. It is bounded on the north by
Genesee county, east by Steuben county, south
by Pennsylvania, west by Cattaraugus county.
The area is 1120 square miles. The first settle-
ment of this county commenced in 1804, whence
it is at present in its infant state. It is watered
by the Genesee river, which follows a devious
course nearly through its centre from south to
north, receiving many small streams from every
part. In the south-west corner some small
streams are collected, which form the eastern
sources of Allegany river, and in the south-west
corner rise the eastern sources of Cattaraugus
Creek. The soil is rich, though a considerable
part of the land is broken. The Merino sheep
have been introduced along with other agricul-
tural improvements, which are common throughout
the state.

ALLEGANY COUNTY, in Pennsylvania, extends
from the junction of the river of that name with the
Ohio, where its chief town Pittsburg is situ-
ated, to the New York line.

ALLEGANY, or AHALACHIAN MOUNTAINS, a
range of mountains in North America, which
extend in a direction west of south from the forty-
second to the thirty-fourth degree of north lati-
tude. They approach the sea, in the state of
New York, whence, in their course towards the
south, they recede from the sea-shore. Their
breadth may be estimated at 110 miles, and they
consist in a succession of parallel ridges, follow-
ing nearly the direction of the sea-coast, irregu-
larly intersected by rivers, and divided by valleys.
The ridge which separates the Atlantic rivers
from the western waters, generally known by
the name of Allegany, preserves throughout a
nearly equal distance of 250 miles from the
Atlantic ocean, and a nearly uniform elevation
of 3000 feet above the level of the sea. Those
mountains may, however, be perhaps considered
as consisting of two principal chains ; between
these lies the fertile Limestone valley, which,
although occasionally interrupted by transversal

ridges, and, in one place, by the dividing of Allegany ridge, may be traced from Newburgh and Esopus, on the Hudson river, to Knoxville on the Tennessee. The eastern and narrowest chain is the blue ridge of Virginia, which, in its north-east course, under various names, traverses the states of Maryland, Pennsylvania, and New Jersey, forms the high lands broken at West-point by the tide of the Hudson, and then uniting with the Green mountains, assumes a northerly direction, and divides the waters of the Hudson, and of lake Champlain, from those of Connecticut river. On the borders of Virginia and North Carolina the blue ridge is united, by an inferior mountain, with the great western chain, and thence to its southern extremity becomes the principal or dividing mountain, discharging eastwardly the rivers Roanoke, Pedee, Santee, and Savannah, into the Atlantic ocean ; southwardly the Chatahouchee, and the Alabama into the gulf of Mexico, and westwardly the New River and the Tennessee. The New River, taking a northwardly course, breaks through all the ridges of the great western chain, and, at a short distance beyond it, unites under the name of Kanawha with the Ohio. The Tennessee pursues at first a south-west direction between the two chains, until having reached, and in a westwardly course turned, the southern extremity of the great western chain, it assumes a northwardly direction, and joins its waters with those of the Ohio, a few miles above the confluence of that river with the Mississippi. The western chain, much broader, and more elevated, is known by the names of Cumberland and Gauley mountains, from its southern extremity, near the great bend of the Tennessee river, until it becomes in Virginia the principal or dividing mountain. Thence, in its northerly course, towards the state of New York, it discharges westwardly the Green Briar river, which, by its junction with the New River, forms the Kanawha, and the rivers Monongahela and Allegany, which, from their confluence at Pittsburgh, assume the name of Ohio. Eastwardly it pours into the Atlantic ocean, James river, the Potomac, and the Susquehannah. From the northernmost and less elevated spurs of the chain, the Genesee flows into the lake Ontario ; and in that quarter the northerly branches of the Susquehannah seem to take their source, from amongst the inferior ridges, and in their course to the Chesapeake to break through all the mountains. From the Susquehannah the principal chain assumes a more eastwardly direction, and is washed on the north by the lateral valley of the river Mohawk. Whilst it gives rise southwardly to the Delaware, it terminates under the name of Catskill mountain, near the tide-water of the Hudson. In the back parts of Pennsylvania, scarce one acre in ten of this vast range is capable of cultivation ; but in other parts, extensive tracts of fine arable and pasture land intervene between the ridges, having a fine rich black soil ; and some of the mountains admit of cultivation almost to their tops.

ALLEGANY RIVER, a river of North America,
which rises on the western side of the Allegany
mountains, about twenty miles from Lake Erie ;
and after a course of 200 miles in a south-west
direction, meets the Monongahela at Pittsburg,

when these rivers both unite from the Ohio. In its course it is increased by French Creek and other smaller rivers, and begins to be navigated about 200 miles from Pittsburg. Its banks are fertile, and the planters settled upon it, as well as upon the Monongahela, export the products of their grounds by way of the Ohio and the Mississippi. For about 150 miles above Pittsburg the lands consist of white oak and chestnut ridges, and in many places of poor pitch pines, interspersed with tracts of good land and low meadow. The waters of the Allegany are clear and limpid in all weathers.

ALLEGATA, Lat. from *allegatus*, appointed; a word anciently subscribed at the bottom of rescripts and constitutions of the emperors, as *signata*, or *testata*, was under other instruments; and synonymous with *verificata*, verified. It was, however, less used than *data*, *propositum*, *accepta*, &c.

ALLEGE', ALLEGATION, ALLEGABLE, ALLEGEMENT, ALLEG'GER. Ad: *lego*, allegatio. To state by way of excuse or proof. To declare; affirm; maintain; urge.

I wene þe kyng allegid, þei were of his tresour,
Noþoles he wild haf briggid, þe fals loue and erroure.

R. Baume, p. 247.

And eke this noble duke aleyde
Full many an other skill, and seide,
She had well deserved wreche.

Gower. Con. A. book iii.

Thy son Enee, myskawing this deray,
As thou *allegeis*, is absent now away.

Douglas, book x. p. 316.

Thei wollen *a leggen* al so, and by þe godspel preoven hit

Nolite judicare quenquam.

Vision of Pier's Plothman, p. 202.

Hath he not twit our sovereign lady here
With ignominious words, though darkly coucht?
As if she had suborned some to swear
False *allegations*, to o'erthrow his state.

Shakspeare's Henry VI.

If we forsake the ways of grace or goodness, we cannot *allege* any colour of ignorance, or want of instruction; we cannot say, we have not learned them, or we could not.

Sprat.

He hath a clear and full view; and there is no more to be *alleged*, for his better information. Locke.

The narrative, if we believe it as confidently, as the famous *allegor* of it (Phamphilio) appears to do, would argue; that there is no other principle requisite, than what may result from the lucky mixture of several bodies.

Boyle.

ALLEG'GAS, or ALLEGIAS, a stuff manufactured in the East Indies; of which there are two sorts; the one of cotton, and the other of several kinds of herbs, spun like flax. They are eight ells by five, six, or seven eighths, and twelve ells by three fourths or five eighths.

ALLE'GIANCE, n. Ad: *ligare*, to bind.

ALLE'GIANT. to. Old Fr. *allegiance*. The *tie* or *bond* of fidelity which binds the governed to the governor. Applied also to any tie or bond of duty, or good faith.

In this passe tyme. Robert duke of Normandy, mowed in coneyence to vysyte the holy sepulture of our Lorde, called before hym his lordes of his lande, wyllyngne and cõmaundynge theym to owe theyr trewe *allegeaunce* vnto his yonge sone, Wyllyam; and

to take hym for theyr lord and duke, if he retourne nat agayne.

Fabyan, p. 220.

I did pluck *allegiance* from men's hearts,
Loud shouts and salutations from their mouths,
Even in the presence of the crowned king.

Shaksp.

For your great graces
Heap'd upon me, poor undeserve, I
Can nothing render, but *allegiant* thanks,
My pray'rs to heaven for you.

Shaksp. Henry VIII.

We charge you, on *allegiance* to ourselves,
To hold your slaughtering hands, and keep the peace.

Shaksp.

The house of commons, to whom every day petitions are directed by the several counties of England, professing all *allegiance* to them, govern absolutely; the lords concurring, or rather submitting, to whatsoever is proposed.

Clarendon.

Ere wit oblique had broke that steady light,
Man, like his Maker, saw that all was right;
To virtue in the paths of pleasure trod,
And own'd a father when he own'd a God.
Love all the faith, and all th' *allegiance* then,
For nature knew no right divine in men.

Pope's Essay on Man, Epist. iii.

ALLEGIANCE, in English law, Lat. from *alligare*, to bind, is the ligamen, or tie, which binds the subject to the king, in return for that protection which the king affords the subject. The thing itself, substantially, is founded in the nature of government; the name and form are derived to us from our Gothic ancestors. Under the feudal system, every owner of lands held them in subjection to some superior, from whom, or from his ancestors, the tenant, or vassal, had received them; and there was a mutual trust subsisting between the lord and vassal, that the lord should protect the vassal in the enjoyment of the territory he had granted him, and that the vassal should be faithful to the lord, and defend him against all his enemies. This obligation on the part of the vassal was called his fidelitas or fealty: and an oath of fealty was required by the feudal law to be taken by all tenants to their landlord, which is expressed in almost the same terms as our ancient oath of allegiance; except that, in the usual oath of fealty, there was frequently an exception of the faith due to a superior lord, under whom the landlord himself was perhaps only a tenant or vassal.

But when the acknowledgment was made to the superior himself, who was vassal to no man, it was no longer called the oath of fealty, but the oath of allegiance; and therein the tenant swore to bear faith to his sovereign lord, in opposition to all men, without any exception. Land held by this species of fealty, was called *feudum legium*, a liege fee; the vassals, homines ligii, or liege-men; and the sovereign, *dominus ligius*, or liege lord. And when sovereign princes did homage to each other, for lands held under their respective sovereignties, a distinction was always made between simple homage, which was only an acknowledgment of tenure, and liege homage, which included the fealty before-mentioned, and the services consequent upon it.

In Britain, as it became a settled principle of tenure, that all lands in the kingdom are holden of the king as their sovereign and lord paramount, no oath but

that of fealty could be taken to inferior lords; and the oath of allegiance was necessarily confined to the person of the king alone. By an easy analogy, the term of allegiance was soon brought to signify all other engagements due from subjects to their prince, as well as duties merely territorial. And the oath of allegiance, as administered in England for upwards of 600 years, contained a promise ‘to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honour, and not to know or hear of any ill or damage intended him, without defending him therefrom.’ But, at the revolution, the terms of this oath being thought to favour non-resistance, the present form was introduced by the Convention Parliament, which is more general and intermediate than the former; the subject only promising ‘that he will be faithful and bear true allegiance to the king,’ without mentioning ‘his heirs,’ or specifying in the least wherein that allegiance consists. The oath of supremacy is principally calculated as a renunciation of the pope’s pretended authority: and the oath of abjuration, introduced in the reign of King William III, very amply supplies the loose and general texture of the oath of allegiance; as it recognises the right of his majesty, derived under the act of settlement; engaging to support him to the utmost of the juror’s power; promising to disclose all traitorous conspiracies against him; and expressly renouncing any claim of the descendants of the late pretender, in explicit terms. This oath must be taken by all persons in any office or employment; and may be tendered by justices of the peace to any person whom they suspect of disaffection. It may also be tendered to all persons above the age of twelve years, whether natives, denizens, or aliens. Besides these express engagements, the law also holds that there is an implied, original, and virtual allegiance, due from every subject to his sovereign, antecedent to any express promise, and although the subject never swore any allegiance in form. Thus Sir Edward Coke observes, that ‘all subjects are equally bounden to their allegiance as if they had taken the oath; because it is written by the finger of the law in their hearts, and the taking of the corporeal oath is but an outward declaration of the same.’ Allegiance, both expressed and implied, is however distinguished by the law into two species, the one natural, the other local.

In natural-born subjects, and also in subjects naturalized by law, allegiance is perpetual, and cannot be dissolved. The former, immediately upon their birth, are under the king’s protection; and the latter are so, immediately upon their naturalization. This species of allegiance therefore becomes a debt of gratitude, which cannot be forfeited or altered by any change of time, place, or circumstance; nor by any thing except the united concurrence of the legislature. Thus, a Briton, who removes to France or to China, owes the same allegiance to the British sovereign, as when at home; and the same twenty years hence as now.

The oath of allegiance, or rather the allegiance sworn to in it, is held to be applicable, not only

to the political capacity of the king, or regal office, but to his natural person and blood-royal; and for the misapplication of their allegiance, viz. to the regal capacity, exclusive of the person of the king, were the Spencers banished in the reign of Edward II.

It is to be observed, however, in explanation of this allegiance, that it does not preclude resistance to the king, when his misconduct or weakness is such as to make resistance beneficial to the community. Allegiance is obedience to lawful commands. If the king should issue a proclamation, levying money, or imposing any service or restraint upon the subject, beyond what the law authorized, there would exist no sort of obligation to obey such a proclamation. Neither can allegiance extend to the king after he is actually deposed, driven into exile, or otherwise rendered incapable of exercising the regal office. The promise of allegiance implies, that the person to whom it is made continues to exercise the power, and afford the protection, which belong to the office of king.

Local allegiance is that which is due from an alien or stranger born, so long as he continues within the king’s protection; and it ceases the instant such stranger transfers himself from this kingdom to another. It is founded on the principles of civil policy, ‘that the government which gives protection requires obedience.’ The common law prescribes the taking the oath of allegiance by all persons above twelve years of age, at courts leet; and there are various statutes requiring the oaths of allegiance and supremacy to be taken under penalties. Persons above the age of eighteen may be summoned by any justice of peace to take these oaths; and if any natural-born subject be withdrawn from his allegiance, and be reconciled to the pope or see of Rome, or shall promise obedience to any other state, he and his advisers incur the guilt of treason. 1 Eliz. c. i. 1 William and Mary, c. i. 8. 1 Anne, stat. i. c. 22, &c. &c.

ALLEGORYE, or Αλλος, another; αγορεω, to make a speech;
AI'LEGORY, n. αλληγορια, another meaning.
ALLEGORICAL, αλληγορια, another meaning.
ALLEGORICALLY, αλληγορια, another meaning. A figurative discourse in which something is intended besides what the words literally signify.

For it is wrytten, that Abraham had two sonnes, the one by a bonde mayde the other by a fre womā. Yee and he whynch was borne of the bonde woman, was born after the fleshe: but he which was of the fre womā, was borne by promes. Whiche thynges are spoken by an *Allegorye*. For these are two testamētes. *Bible*, 1539. *Galatians*, iv.

Wyth hys *allegorical* expisition of spirituall eatynge of Christes godhead and of his bodi by belife of hys passion, he goeth about to take away from vs the very lytteral truth, of the very eating and bodily receiuing of Christes own veri flesh and blodd.

Sir Thomas More’s Workes, p. 1041, c. i.

When our Saviour said, in an *allegorical* and mystical sense, ‘ Except ye eat the flesh of the Son of Man, and drink his blodd, ye have no life in you,’ the hearers understood him literally and grossly.

Bentley.

The epithet of Apollo for shooting, is capable of two applications; one literal, in respect of the darts

and bow, the^{*} designs of that god; the other *allegorical*, in regard to the rays of the sun. *Poppe.*

Fable may be divided into the Probable, the Allegorical, and, the Marvellous. *Pope.*

The stoic philosophers, as we learn from Cicero, were great *allegorizers*. *Coventry. Phil. Com.*

Neither must we draw out our *allegory* too long; lest either we make ourselves obscure; or fall into affectation, which is childish. *Ben Jonson.*

This word *nympha* meant nothing else, but (by *allegory*) the vegetative humour or moisture, that quickeneth and giveth life to trees and flowers, whereby they grow. *Peacham.*

On the broad stern, a pencil warm and bold,
That never servile rules of art controll'd,
An allegoric tale on high pourtray'd
There a young hero, here a royal maid. *Falconer's Shipwreck, can. ii.*

ALLEGORY, in composition, a figure of speech which conceals, under the literal meaning of our words, another and a different sense. It seems to be derived from *αλλογ*, another, and *ἀγορά*, an harangue; and is a species of composition with which the eastern writings abound. An allegory differs from a metaphor or simile, as it consists of a continued story, told in a chain of metaphors. Thus, likening a ship to a state is a simile; but to steer the ship through storms without, to rule it in spite of mutiny within, and to reach the destined port in safety, signifying the outward warfare and the internal rebellions of that state, overcome by the wisdom of its governor, is an allegory, and one of the most usual, and the most obvious kind. Thus Horace, l. i. ode xiv.

O navis, referent in mare te novi
Fluctus. O quid agis? fortiter occupa
Portum.

The principal subject is kept out of view, but all its circumstances and properties will be represented 'in common with all other metaphorical language.' Says a late author, 'an allegory is exactly similar to an hieroglyphical painting, only substituting words for colours.'

Numberless instances of allegory, in the highest style of excellence, might be given from writers in our own language, as it has been a favourite figure of composition with us. The Bible abounds in the finest instances, of which Blair gives Psalm lxxx. ver. 8—16 as a specimen. Spenser's Faerie Queene is an allegory throughout, and Addison, in his Spectator, abounds with allegories, any of which may be taken as a prototype for this kind of figure. The resemblance of an allegory to its real and intrinsic meaning may be too obvious; but equal care must be taken that it may not be broken or obscure; for in the one case the pleasure is destroyed, and in the other the instruction intended to be conveyed is overwrought, hidden, and finally lost. Most writers are unlucky in their choice, the analogy being generally so faint and obscure, as rather to puzzle than to please.

The distinctive characters of allegory and parable have not in general been accurately defined. The beautiful parable of the Egyptian vine, Psalm lxxx., is by no means a correct allegory. The figure in parable is altogether imaginary;

in correct allegory it is real. The history of Abraham's family, particularly Sarah's miraculous, and Hagar's natural conception, with the birth and strife of their sons, are expressly called an *allegory*, Gal. iv. 24, representing the two covenants. But although this distinction applies, in general, to scriptural allegories and parables, in other writings allegory is universally understood to be a work of imagination. Thus Spenser's Faerie Queene, Butler's Hudibras, Swift's Tale of a Tub, and Gulliver's Travels, &c. are allegories, wherein the figures, personages, and scenes represented, are entirely imaginary, though the moral and satire contained in them apply to real life and historical facts. Nothing gives greater pleasure than an allegory, when the representative subject bears a strong analogy, in all its circumstances, to that which is represented.

No author ancient or modern has drawn a more complete or perfect allegory than John Bunyan, in his Pilgrim's Progress; a work which, we believe, has afforded pleasure to many readers, even among those who do not entirely approve of the doctrines it inculcates. An eminent London bookseller, lately deceased, who had made an estimate of the quantity of copies sold of the books most universally read, says, that upwards of 430,000 copies of Bunyan's Pilgrim's Progress have been printed; which exceeds the sale of all the other books in the English language, except, the Bible and Prayer books, &c. by above 100,000 copies! This affords an indubitable proof how universally a well written allegory is relished. See FABLE, METAPHOR, PARABLE, TYPE, &c.

ALLEGORICAL SYMBOLS. The following extract from one of Plutarch's moral essays, is a curious specimen of the symbolical language, in which the ancients sometimes concealed their precepts. These allegorical symbols were employed by Pythagoras; and the Chaldean oracles, given by Mr. Taylor, could they be at this day as ingeniously elucidated, might appear more significant, and less mysterious.—We must not feed on fish with black tails; that is, we must avoid all connexions with men of a malignant character.—Tread not on the scales; that is, respect justice, and be careful not to infringe the laws.—Sit not on the bushel; that is, fly all indolence, and labour for the necessities of life.—Wear not a tight ring; that is, preserve your liberty, and be the slave of no person.—Stir not the fire with a sword; that is, irritate not a man in a passion, but strive to calm him.—Gnaw not your heart; that is, give not yourself up to devouring griefs.—Abstain from eating beans; that is, do not meddle with the affairs of government. for anciently the votes for the election of magistrates were made with beans. It is in this manner that the commencement of all knowledge has been made in enigmas; and these have appeared to remote posterity more absurd and barbarous than they really were, by metaphors which are unintelligible, and customs which are forgotten.

ALLEGANZA, a very small island, or rather rock, the most northerly of the Canaries. It is barren and destitute of inhabitants, and is only resorted to by those of the neighbouring islands at certain times to gather orchilla.

ALLEGAMENTE, in music, rather quick.

ALLEGRESSIMO, in music, very quick.

ALLEGRETTO, in music, a diminutive of allegro, which is more quick and lively:

ALLEGRI (Alexander,) an Italian satirical poet, of the latter end of the sixteenth century, who was born at Florence. He served in the army, but afterwards became an ecclesiastic. His principal works are *Rime piacevoli*, *Lettore di ser poi Pedante*, and *Fantastica Vizioni di Parri da Pozzolatico*. These were published together in one volume, which is now very scarce. Allegri left other poetry in the hands of his family, which never was published, together with a tragedy entitled *Idomeneus*, and several Latin poems of considerable excellence.

ALLEGRI (Gregorio,) was an eminent musical composer of the seventeenth century, a native of Rome, and by profession an ecclesiastic. He was a disciple of Namini, who was contemporary with Palestrina, and his intimate friend. His abilities as a singer were inconsiderable, and yet he was accounted an admirable master of harmony; and the pope appointed him to be one of the singers at the Vatican in 1629. To his extraordinary merit as a composer of church music, he is said to have joined a devout and benevolent disposition, and an excellent moral character. He died February 18th, 1672, and was buried in the Chiesa Nuova, before the chapel of St. Filippo Neri.

ALLEGRI (Antonio.) See **CORREGIO**.

ALLEGRO, in music, a word denoting one of the six distinctions of time. It expresses a sprightly motion, the quickest of all, except *Presto*, and originally means gay, as in Milton.

ALLEGRO, Più, in the Italian music, intimates to play or sing a little quicker.

ALLEGRO Poco Più; that the part it is joined to must be played, or sung, a little more brisk and lively than *allegro* alone requires. The usual distinctions succeed each other in the following order: *grave*, *adagio*, *largo*, *vivace*, *allegro*, and *presto*. The movements of the same name, as *adagio*, or *allegro*, are swifter in triple than in common time.

ALLEIN (Joseph,) the son of Tobias Allein, was born in Dévizes in 1633, and educated at Oxford. In 1655 he became assistant to Mr. Newton, of Taunton Magdalen, in Somersetshire; but was deprived for non-conformity. He died in 1668, aged 35. He was a man of great learning, and greater charity; preserving, though a non-conformist, and a severe sufferer on that account, great respect for the church, and loyalty to his sovereign. He wrote several books of piety, which are highly esteemed; but the most celebrated is his *Alarm to Unconverted Sinners*, of which the sale has always been considerable.

ALLEIN (Richard,) a nonconformist divine, born in 1611, at Ditchet, in Somersetshire. He was educated at Oxford, and in 1641 obtained the living of Batcomb, in Somersetshire, from which he was ejected for nonconformity, and preached privately till his death in 1681. His writings on practical divinity have been useful.

ALLELENGYON, in antiquity, a kind of tax or tribute, which the rich paid for the poor, when absent in the armies.

ALLELOPHAGI, from *αλληλαγε*, one another, and *φαγω*, I eat, in natural history, a term used by Mouffet, and other writers on insects, to express a peculiar genus of flies, which devour one another; thus called in distinction from the heterophagi, which feed on different substances, and not on one another.

ALLELUIA, **ALLELUJAH**, or **Hallelujah**, **הַלְלוּיָה**, Praise ye the Lord.

He will set his tongue to those pious divine strains, which may be a proper præludium to those *allelujahs* he hopes eternally to sing.

Government of the Tongue.

Then shall thy saints

Unfeigned *hallelujahs* to Thee sing;

Hymns of high praise.

Milton.

ALLELUJA, in botany, a name used by many for the common wood sorrel.

ALLELUJAH, in sacred music, an expression formerly used in religious assemblies, as a call for each other to praise the Lord.

ALLEMAND, a sort of grave solemn music, invented by the Germans, with good measure, and a slow movement. Also a brisk kind of dance, very common in Germany and Switzerland.

ALLEMANDA, in music books, a certain air in common time, and in two parts, each part being played twice over.

ALLEMANNIC, **ALAMANNIC**, or **ALEMANNIC**, from Alemanni, Allemanni, or Alamanni; the name whereby the German nation was anciently known; any thing relating to the ancient Germans. Goldastus published collections of writers on Allemannic affairs. The Allemannic language was spoken throughout the southern parts of Germany, which was divided into several districts; the principal of which are the Suevic and Helvetic. It differed from the Francic, which was the language in use through the northern parts of Germany. The chief dialects of this are the Palatine, Franconian, and Saxon.

ALLEMANNIC LAW, otherwise called the Suevic law, that which obtained in the more southern parts of the country, as the Saxon law did throughout the northern. Schilter has published the feudal Allemannic law.

ALLEN, a county town of Kentucky, in the United States, North America, population 5327; Scottsville, 160 miles south-west by south of Frankfort, is the chief town: also the name of a newly formed county in the state of Ohio.

ALLEN, Bog or, an immense tract of moss, the largest in Ireland, which runs through part of the counties of Dublin, Carlow, Kildare, Kilkenny, and Meath. Part of it has been recovered and cultivated, by burning and sowing it with rape-seed.

ALLEN, ISLE OF, corrupted from Hy-al-lain, Irish, i. e. the district of the great plain, a district of Ireland, in the county of Kildare.

ALLEN, (John,) archbishop of Dublin, under Henry the VIII. was educated in the university of Oxford, but took his degree of A. B. at Cambridge. Being sent by Dr. Warham, archbishop of Canterbury, to the pope, he continued at Rome nine years, and was there created L.L. D. After his return he was appointed chaplain to cardinal Wolsey, and judge of his court as legate a latere.

He assisted the cardinal in suppressing forty small monasteries, for the erection of his colleges at Oxford and Ipswich; and Wolsey procured him the living of Dalby in Leicestershire. In 1528 he was consecrated archbishop of Dublin, and about the same time made chancellor of Ireland. His principal works are, 1. *Epiſtolaē de Pallii ſignificatione activa et paſſiva.* 2. *De Conſuetudinibus ac statutis in tuitoriis cauis obſervandis;* with several other pieces on ecclesiastical affairs. He was barbarously murdered in an insurrection set on foot by Thomas Fitzgerald, eldest son of the earl of Kildare, in 1534.

ALLEN, (Thomas,) a famous mathematician of the sixteenth century, born at Uttoxeter in Staffordshire, the 21st of December, 1542. He went to Oxford in 1561; and in 1567 took his degree of A. M. In 1570 he retired to Gloucester-hall; and when Robert earl of Leicester would have conferred a bishopric upon him, his love of solitude made him decline the offer. The author of book, entitled *Leicester's Commonwealth*, accused him of using the black art, to promote the earl of Leicester's unlawful designs, and to bring about a match between him and queen Elizabeth. He published in Latin the second and third books of Claudius Ptolemy of *Pelusium*, concerning the Judgment of the Stars; or, Quadruplicate Construction, with an exposition. He wrote also a *Commentary on Lilly's books*, and on John Bale's work, *De Scriptoribus M. Britanniae*. Having lived to a great age, he died in Gloucester-hall in 1632.

ALLENBURG, a town of East Prussia, in the circle of Tapiau, with 1350 inhabitants. It stands on the Alle, about thirty miles south-east of Konigsberg.

ALLENCE, in mineralogy, another name for stannum.

ALLENDALE, E. and W. townships in Tindal ward, Northumberland, nine miles and a half south-west from Hexham, and 291 miles from London; containing 790 houses and 4629 inhabitants. They are chiefly inhabited by miners, and stand, as the name implies, in a dale at the foot of Tinney-hill, on the river Allen, which flows into the South Tyne.

ALLENDORF, a bailiwick and small town of Hesse Darmstadt, between Marburg and Giessen, with 1030 inhabitants: six miles north-east of Giessen. Long. 8°. 51'. E. lat. 50°. 40'. N. Also a small town of Germany, in the duchy of Westphalia.

ALLENDORF, a town in the electorate of Hesse-Cassel, remarkable for its salt-works and three stone bridges. It is seated on the Weser, fifteen miles east of Cassel, and contains 2500 inhabitants.

ALLENSTEIN, in Polish Olsztan, a bailiwick and town, with a castle, in East Prussia. Population 2000. Sixty miles south of Konigsberg. Long. 20°. 25'. E. lat. 53°. 40'. N.

ALLENSTOWN, a town of New Jersey, North America, fifteen miles north-east from Burlington, and thirteen south by east from Princeton. Also a township of North America, in New Hampshire, situated on the east side of Merrimack river, twenty-five miles north-west of Exeter, and forty from Portsmouth.

ALLEN-TOWN, Northampton county, in Penn-

sylvania, is situated on the point of land formed by Jordan's creek, and the Little Lehigh, and contains about ninety houses, and an academy. Long. 75°. 30'. W. lat. 40°. 35'. N.

ALLER, a river of Germany, which rises in Magdeburg, runs north-west through the duchy of Lunenburg, and, passing by Zell, falls into the Weser a little below Verdun.

ALLERBERG, a market-town of Bavaria, sixteen miles from Nuremberg. Inhabitants, 1570.

ALLER SANS JOUR, in law, Fr. to go without day: to be finally dismissed the court, no farther day being appointed.

ALLERIA, a decayed town of Corsica, where king Theodore first landed, in 1739. Long. 8°. 50'. E. lat. 42°. 5'. N.

ALLERION, or **ALERION**; from aquilario, a diminutive of aquila, an eagle: in heraldry, a sort of eagle without beak or feet, having nothing perfect but the wings. They differ from martlets by having their wings expanded, whereas those of the martlet are close and denote imperialists vanquished and disarmed; for which reason they are more common in French, than in German coats of arms.

ALLERTON, NORTH, or NORTH-ALLERTON, (anciently ALVERTON), a borough and market-town in Allertonshire wap. N. R. of York, 222 miles from London; containing 557 houses and 2626 inhabitants. The manor has been subject to the bishop of Durham from the time of William Rufus. He appoints a bailiff for life, who presides at the election for members of parliament, the choice of whom is in the whole of the housekeepers who pay scot and lot. The town chiefly consists of one street about half a mile long, on a small stream called the Wiske, a branch of the Swale. The church is a Gothic structure, built in the form of a cross, and contains several handsome monuments. Here is a new prison, erected on Mr. Howard's plan, as a relief to the county gaol at York; it consists of thirty cells, with four strong ones for capital offenders, and a place for correction and labour. Formerly there was an ancient castle at North Allerton, which was enlarged by bishop Pudsey; but seized and destroyed by Henry II. A small convent for monks of the Cistercian order was founded here by Edward I. but no remains are extant. Near this place was fought the celebrated battle between the English and Scots, called the battle of the Standard, in 1138. The spot retains the name of Standard Hill, and some caverns near are supposed to be the places where the Scots were buried.

When the invaders under the command of David, king of Scotland, had advanced as far as this town, committing the most horrid murders and desolations, they were met by the English army under the command of the earls of Albemarle and Ferrers. In order to animate them, the archbishop of York brought forth a consecrated standard from the convent of Beverley, which was drawn on a four-wheeled carriage; from this circumstance it derived its name. The battle was fought with great obstinacy on both sides; until the Scots, through a mistake, imagined their king was slain, when the flight became general, and a great slaughter ensued. The town has a good weekly market on Wednesday

for corn, cattle, and provisions. The living is a vicarage, value £ 17. 10s., of exempt jurisdiction. Patron, the dean and chapter of Durham.

ALLERTON, a township in the parish of Bradford, North Riding of York, 199 miles from London, and three north-east of Bradford. Population 1488.

ALLERTON-CHAPEL, a township and curacy of Leeds parish, 193 miles from London, and three north of Leeds, with 1678 inhabitants. It has a hospital for ten widows, with an endowment of fifty pounds annually, given by Robert Parker.

ALLERSHEIM, a market-town of Bavaria, six miles south of Wurtzburgh.

ALLESTRY, (Richard, D. D.) born at Upington in 1619, was educated at Coventry, and afterwards at Oxford. He took up arms for king Charles I. and was sometimes seen with his musket in one hand, and his book in the other. Being very active in the service of Charles II. before his restoration, he was seized at Dover by a party of soldiers, as an emissary of the royalists, and confined six or eight weeks. On the restoration, he was made canon of Christ-Church, chaplain to the king, and regius professor of divinity. In 1665 he was appointed provost of Eton college, and raised the school, which he found in a low condition, to great reputation.—The west side of the outer quadrangle of the college was built from the ground at his expense. He died in 1680, and lies buried in Eton chapel.

ALLESTRY, (Jacob,) of the same family as the above, entered at Christ Church, Oxford, in 1671; was elected student in 1672; took his degree in arts in 1679; and died in 1686. He published Examen Poeticum, containing verses and pastorals, spoken in the theatre at Oxford in 1681, before James, duke of York, his duchess, and the lady Anne.

ALLEVEURE, the smallest copper coin that is struck in Sweden, not worth quite two deniers Tournois, of France, or above a British half-penny.

ALLEVIARE, in old records, to levy or pay an accustomed fine or composition.

ALLEVIATE, v. { Ad : *levo, levus*, light.

ALLEVIATION, { To make light; to lift up

ALLEVIATIVE. { A weight or burden so as to relieve the person carrying it. To lessen; to comfort; to ease; to soften.

These are, my son, special compositions of wholesome recipes for the several maladies of thy soul; wherein it shall be my happiness to have suggested unto thee such thoughts as may any whit avail to the alleviation of thy sorrows.

Bp. Hall's *Balm of Gilead.*

The pains, taken in the speculative, will much alleviate me in describing the practical part. Harvey.

Most of the distempers are the effects of abused plenty and luxury, and must not be charged upon our Maker; who, notwithstanding, hath provided excellent medicines, to alleviate those evils which we bring upon ourselves.

Bentley.

Some cheering alleviative to lads kept in pure slavery to a few Greek and Latin words.

Corah's Doom.

All apologies for, and alleviations of, faults, though they are the heights of humanity; yet they are not the favours, but the duties, of friendship. South.

This loss of one-fifth of their income will sit heavy

on them, who shall feel it, without the *alleviation* of any profit.

Loche.

He [David] sought in piety that peace which he could not find in empire, and alleviated the disquietudes of state with the exercises of devotion. Horne.

ALLEY, n. Fr. *aller*, to go. Skinner defines it a way through which it is possible to go or pass. Applied to walks in a garden, to paths, or passages, from streets and roads.

So long about the *alleys* is he gan,
Till he was comen again to thilke pery,
Wher as this Damian sitteth ful mery
On high among the freshe leves grene.

Chaucer. *The Merchant's Tale*, vi. p. 414.
And all within were walks and *alleys* wide,
With footing worn, and leading inward far.

Spenser.

Where *alleys* are close gravelled, the earth putteth forth the first year knotgrass, and after spiregrass.

Bacon's *Natural History*.

Yonder *alleys* green,
Our walk at noon, with branches overgrown.

Milton.

Come, my fair love! Our morning's task we lose:
Some labour, ev'n the easiest life would choose:
Ours is not great; the dangling bows to crop,
Whose too luxuriant growth our *alleys* stop.

Dryden.

The thriving plants, ignoble broomsticks made.
Now sweep those *alleys* they were born to shade.

Pope.

Here oft the peasant, with enquiring face,
Bewilder'd trudges on from place to place;
He dwells on every sign with stupid gaze,
Enters the narrow *alleys* doubtful maze.

Gay's *Trivia*, book ii.

ALLEY, in horticulture, a straight parallel walk, bounded on both sides with trees, shrubs &c. and usually covered with gravel or turf.

ALLEY, in husbandry, the vacant spaces between the uttermost row of corn on one bed and the nearest row to it on the next parallel bed; usually about four feet in breadth, exclusive of the partitions between the rows of corn in the beds. See HOEING.

ALLEY, in perspective, that which, in order to have a greater appearance of length, is made wider at the entrance than the termination.

ALLEY, (William,) a bishop of Exeter in the reign of Queen Elizabeth, was born at Great Wycombe in Buckinghamshire. From Eton, in 1528, he removed to Cambridge, where he took the degree of A. B. He also studied some time at Oxford; was presented to a living, and became a zealous reformer. Upon queen Mary's accession he left his cure, and retired into the north of England, where he maintained his wife and himself by teaching, and practising physic. On queen Elizabeth's accession he went to London, where he acquired great reputation by reading the divinity lecture at St. Paul's, and in 1560 he was made bishop of Exeter. He died in 1570; and was author of, 1. The poor man's library, two vols. fol. Lond. 1571, which contains twelve lectures on the first epistle of St. Peter, read at St. Paul's. 2. A Hebrew grammar. He also translated the Pentateuch, in the version of the Bible which was undertaken by queen Elizabeth's command.

ALLEYN, (Edward,) an English actor in the reigns of Elizabeth and James I. but principally known as the founder of Dulwich college, Surrey. He was born at London, in 1566, and in high favour with the town, in 1592. He usually played the capital parts, and was one of the original actors in Shakspeare's and Ben Jonson's plays, the latter highly applauded him. He was keeper of the royal bear-garden, which was frequented by vast crowds of spectators; and was thrice married. Aubrey mentions a tradition, that Alleyn playing as a demon, with six others, in one of Shakspeare's plays, was, in the midst of the scene, surprised by the appearance of the devil himself; and that this so worked upon his imagination, that he made a vow of charity, which he performed by building DULWICH COLLEGE, which see. He met with some difficulty in obtaining a charter for settling his lands on the college, having proposed to endow it with £3000. per annum, for the maintenance of a master, warden, and four fellows, whereof three were to be clergymen, and the fourth a skilful organist; also six poor men and as many women, besides twelve poor boys to be educated till the age of fourteen or sixteen, and then put out to some trade. Lord Chancellor Bacon wished a part of them to be settled for the support of two academical lectures. He was himself the first master of this college, which he called the College of God's gift; and died, Nov. 25th, 1626, aged 61. In the chapel of his college, where he was buried, there is a tomb-stone over his grave, with an inscription. His original diary is also preserved.

ALLEZER, Fr. in military affairs, to cleanse the mouth of a cannon or other piece of ordnance, and to increase the bore, so as to produce its determined calibre.

ALLEZOIR, Fr. in military affairs, is a frame of timber suspended in the air with strong cordage, on which is placed a piece of ordnance with the muzzle downwards. In this situation the bore is rounded and enlarged by means of an instrument which has a very sharp and strong edge, made to traverse the bore by men or horses, in a horizontal direction.

ALLIA, in ancient geography, a river of Italy, now the Ajo, which, running down a very steep channel from the mountains of Crustumini,

I with the Tiber at forty miles from Rome. It is famous for the great slaughter of the Romans by the Gauls, under Brennus; hence Aliensis dies, an unlucky day. ‘Our ancestors,’ says Cicero, ‘deemed the day of the fight of Allia more fatal than that of taking the city.’ Virgil alludes to this battle, *AEn.* vii. v. 717.

Quosque secans infastum interluit Allia nomen.

ALLIAGE, in military affairs, a term used by the French, to denote the composition of metals used for the fabrication of cannon and mortars, &c.

ALLIANCE, with the ancient Romans, though a sort of servitude, was much coveted. Ariarathes, we are told by Polybius, offered a sacrifice to the gods by way of thanksgiving for having obtained this alliance. The Romans had different sorts of allies; some only united to them by a participation of privileges, as the

Latini and Hernici; others by their foundation, as the colonies; others by the benefactions they received from them, as Massinissa, Eumenes, and Attalus, who owed their kingdoms to Rome; others again by free treaties, which last became finally subjects, as the kings of Bithynia, Capadocia, Egypt, and most of the cities of Greece; lastly, others by compulsive treaties, and subjection, as Philip and Antiochus. For they never granted peace to an enemy, without making an alliance with him: that is, they never subdued any people without using that conquest as a means of subduing others. The forms or ceremonies of alliance have been various in different ages and countries. Anciently eating and drinking and offering sacrifices together were customary rites of ratifying alliance. Among the ancient Arabs, alliances were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a sharp stone, dipping in it a piece of their garments, and therewith smearing other stones. Among the people of Colchis, the confirmation of alliances was said to be effected by one of the princes offering his wife's breasts to the other to suck, which he was obliged to do till blood issued.

ALLIANCE, in a figurative sense, is applied to any kind of union or connection; thus we say, there is an alliance between the church and state.

ALLIARIA, in botany, dame's violet.

ALLICA, in entomolgy, a species of papilio.

ALLICAR, in chemistry, the same as acetum.

ALLIER, a department of France, so named from the river of the next article, composed of the old provinces of the Bourbonnois, &c. part of the généralité of Moulins: having the department of the Creuse and Cher west; the Cher and Nièvre, north; the Saône and Loire east, and the Pay de Dôme, south, for its boundaries. It contains the four arrondissements of Mont Luçon, Moulins, Gaunat, and Palessi; and 254,555 inhabitants.

ALLIER, a river of France, which rises in the mountains of Lozère, near Coudray, and running through the ci-devant provinces of Nivernais, Bourbonnois and Auvergne, becomes navigable near Viale, and falls into the Loire above Orleans.

ALLIGATI, in Roman antiquity, the basest kind of slaves, who were usually kept fettered. The Romans had three orders of slaves or servants; the first employed in the management of their estates; the second in the menial or lower functions of the family; the third, called alligati, above mentioned.

ALLIGATION, in arithmetic. See ARITHMETIC.

ALLIGATOR, in botany, a species of pear. See LAURUS.

ALLIGATOR, in zoology, a synonyme of the hæcera crocodilus. See LACERTA.

ALLIGHAR, or **AYGHAR**, a town and fortress of Hindostan, formerly called Kole, and the residence, in the twelfth century, of Cattub, the first Mahomedan sovereign of Delhi. It stands in the province of Delhi, between the Ganges and the Jumna, and was taken from Scindiah, by the British, in the war of 1803.

British judge and collector are now stationed
re, subordinate to the Bareily division.

ALLINGHEY, a town in the province of Dindigul, Hindostan, thirty miles south-west of Dindigul.

ALLINEGIUR, a town of Hindostan, in the Oude, twenty miles north of Ghazypore.

ALLIONI, (Charles,) a physician and botanist of Piedmont, born in 1725, and died in 1804; leaving many works on botany and medicine, of which the following are the principal: 1. *Pedemontii Stirpium Rariorum Specimen Primum*, 4to. Taurin. 1755. 2. *Oryctographia Pedemontana Specimen*, 8vo. Paris, 1757. 3. *Enumeratio Stirpium Nicensis*, 8vo. Paris, 1757. 4. *Synopsis Methodica Horti Taurinensis*, 4to. Taurin. 1762. 5. *Flora Pedemontana*, 3 vols. folio, Taurin, 1785. 6. *Auctarium ad Flora Pedemontana*, Taurin. 1789.

ALLIQNIA, in botany, a genus of plants of the monogynia order, belonging to the tetandria class; in the natural method ranking under the forty-eighth order, Aggregate. The characters are; the common cal. oblong, simple, three-flowered, five-parted, and persistent; the proper one, obscure, above: the proper cor. monopetalous and funnel-shaped; the mouth quinquefid and erect: stam. four bristly filaments, longer than the corolla, and bending to one side; the anthera roundish: pist. an oblong germen beneath; the stylus bristly, and longer than the stamina; the stigmata are multifid and linear: no pericarpium: the seeds are solitary, oblong, and naked: the receptaculum is naked. There are two species, viz. 1. *Allionia incaranata*, 2. *Allionia violacea*, both natives of America.

ALLIOTII, Arab. a horse: in astronomy, a star in the tail of the Great Bear, marked (ε) by Boyer, whose observation is much used at sea, for finding the latitude. The Arabs give this name to each of the three stars in the tail of the Greater Bear, on account of their appearing like three horses, ranged for drawing a waggon. See *URSA MAJOR*.

ALLIOTICA, **ALLIOTICS**, from *allιοω*, to vary, Galenic medicines for purifying the blood, consisting chiefly of the roots of dandelion, sycory, fennel, and raisins; with the herbs endive common ox-eye, lettuce, sorrel, &c.

ALLISTAR, or **ALLUSTAR**, a mean looking town in the peninsula of Malacca, and kingdom of Quedah, two or three leagues from the mouth of a river. The inhabitants are a mixed race of Indians and Chineses, and the natives of the latter have a large temple here. The sovereign of Quedah resides in a fortress built at Allistar, but his palace hardly equals a respectable English farmhouse and yard.

ALLITERATION, Ad: *litera*, to a letter.

ALLITERATIVE, The placing words in

ALLITERATOR, succession, or at short intervals from each other, commencing with the same letter.

The prosody of the Welsh bards depended much on alliteration. Hence they seem to have paid an attention to the scaldic versification. The Islandic poets

are said to have carried alliteration to the highest pitch of exactness in their earliest period.

T. Warton's Hist. of the Eng. Poetry.

Thus the fields must be flowery, beauty must be beaming, ladies must be lovely; and in the same manner must the 'waves wind their wat'ry way,' the 'blust'reng blasts blow,' and 'locks all loosely lay,' not for the sake of the poetry, but the elegance of the alliteration.

Connisseur, No. 83.

ALLITERATION has been used by the most celebrated poets, both ancient and modern; Virgil, Lucretius, and even Homer not excepted. The Italians were particularly fond of it, as were also our Spenser and Shakespeare. It would be difficult to appropriate this figure to any particular passion, since rage and grief, pity and despair, have been alike expressed by it; also the roughness, strength, smoothness, airiness, and gaiety of the muse. No satisfactory account of alliteration has been given in the writings of the critics. They seem to have passed it over in silence, either as a false refinement, or as a mere trifle. Many chapters have been composed on quantity, on the beauties resulting from different arrangements of long and short syllables, and on the powers of pauses variously placed; but not a word on alliteration. This is the more extraordinary, as one should think it impossible for any man to examine minutely, and dissect a number of verses, without perceiving the vast abundance of this ornament. It is as if an anatomist should publish a complete table of the arteries in the human body, and affect never to have seen a vein nor a nerve: for we may safely affirm, that upon examining any number of verses, remarkable either for sweetness or for energy, many of them will be found in some degree alliterative. We do not say that the sweetness and energy of versification depend chiefly on this circumstance, yet we cannot help believing that it may claim a considerable share: for the poets whose fame is highest for versification, are most extensive dealers in alliteration.—The trifling appearance, and the frequent abuse, of the ornament itself, are circumstances which have induced a degree of neglect. How common is it for writers, who affect to be comic, when in want of other means for raising a smile, to use affected alliteration with success! But, in the fine arts, no beauty or grace is beyond the power of ridicule. The noblest attitudes in painting have been rendered laughable by caricature. So fares it with alliteration. Nor is it to be wondered at, that much of the delight afforded by versification arises from so trifling a cause as the occasional repetition of the same letter or sound on the accented parts of a verse; since there are many other causes of pleasure which, when dissected, seem equally contemptible. The fact is, that the principal operation of this ornament is no doubt mechanical.

It is easier for the organs of speech to resume, at short intervals, one certain conformation, than to assume a number of different ones, unconnected and discordant. For example, a succession of labials, interspersed at regular distances with dentals and gutturals, are more easily pronounced than an irregular and random inter-spersion of all the three. Sounds of which the

articulation is easiest, are most completely in the power of the speaker. Not to add the pleasure that results to the ear from the repetition of the same letter, and which has been compared to the frequent returns of the key-note in music. The ear is pleased with alliteration, as it contributes to the superior ease of recitation; for what is recited with ease must be heard with pleasure. —These remarks might be illustrated by numberless passages from the best poets. Pope's works are full of alliterations; and Grey, who learned his versification from Dryden, as Dryden did from Spenser, seems to have paid particular attention to this grace: indeed these three abound in alliterations. This ornament is almost always founded upon a repetition of one or more consonants; and generally on those in the beginning of the emphatic words; but a verse is held to be alliterative, which has a letter repeated on its accented parts, although those parts do not begin words; the repeated letter bearing a strong analogy to the bars in a musical phrase. The following lines, selected from Pope's *Essay on Man*, afford instances of both kinds of alliteration.

Reason is here no guide but still a guard.

In spite of pride, in erring reason's spite.

Who for thy table feeds the wanton fawn
For him as kindly spreads the flow'ry lawn.

The bounding steed, you pompously bestride,
Shares with his lord the pleasure and the pride,

Man cares for all; to birds he gives his woods;
To beasts his pastures, and to fish his floods:
For some his int'rest prompts him to provide;
For more his pleasure; yet for more his pride.

That very life, his learned hunger craves,
He saves from famine, from the savage saves:
Nay feasts the animal he dooms his feast,
And, till he ends the being, makes it blest.

That Virtue's ends from vanity can raise:

And not a vanity is giv'n iu vain.

Most strength the moving principle requires;
Active its task, it prompts, impels, inspires.

In lazy apathy let Stoics boast
Their virtue fix'd; 'tis fix'd as in a frost.

The young disease that must subdue at length,
Grows with his growth, and strengthens with his strength.

Death still draws nearer, never seeming near.

Great standing miracle! that heav'n assign'd
Its only thinking thing this turn of mind!

Alliterations contribute more to the beauties of poetry, than is generally supposed, and cannot, therefore, be deemed unworthy of a poet's regard in composition. If two words offer of equal propriety, the one alliterative, the other not, the first ought to be chosen if it suit the purpose in every other respect; but the beauty of alliteration, when happy, is not greater than its deformity when affected, or forced. Alliterations are evidently improper, where the sense is sacrificed to the sound; as in the following unnatural metaphor of Grey; "Eyes that glow and fangs that grin;" where the poet ascribes a property to the fangs, that can only belong to the face of an animal; and in the following couplet of Pope's, in the first line of which, however, the alliteration is unexceptionable, viz.;

"The arts of building from the bee receive;
Learn of the mole to plough, the worm to weave."

The idea of a worm weaving, which seems to be introduced as much for the sake of alliteration, as of the rhyme, scarce even poetical licence can justify; for though the silk-worm is an excellent spinster, we believe none of the insect tribe merits the epithet of a weaver except the spider, which does not belong to the class of vermes, or worms.

Alliteration was much affected by the Saxons, as appears from many instances of this kind which occur in their laws. It is oftentimes so frequently introduced as to make the work in which it appears completely ridiculous, an instance of which occurs in the *Nugævenales*, attributed erroneously to one Lates, from Germany, music master in the university at Oxford, which begins thus:

Plaudite, porcelli, porcorum pigra propago
Progreditur.

And it consisted of nearly 350 lines! the real aauthor's name, however, was Petrus Placentius, and he assumed the name of Petrus Porcius, from the subject he so laboriously discussed. Aldhelm, one of the three great luminaries of the Anglo Saxons, also appears to have carried this ornament to the extreme. His letter to Ealhfrid contains a most elaborate specimen of Latin alliteration. Fifteen words begin with the same letter in the first paragraph: "Primitus (pantorum procerum pretorumque pio potissimum paternoque præsertim privilegio) panegyricum poemata que passim prosatori sub polo promulgantes stridula vocum symphonia ac incloidæ cantilenæque carmine modulaturi hymnizensus." In the same letter we have afterwards "torrenda tetra tortiosis in tartara trusit." We are told of one Theobaldus, a Monk of the order of St. Benedict, who flourished in the time of Charles the Bald, to whom he presented a panegyric on baldness, every word beginning with the letter C. The plays and romances of Lilly, which consist wholly of affectation and conceit, contributed to spoil the state of the age in which he lived. Those who are fond of the figure would perhaps equally enjoy a poem composed by the lipogrammatists or letter-droppers of antiquity, who would take an exception against some particular letter in the alphabet so as not to admit it once into a whole book. One Tryphidorus, a great master in this kind of writing, is said to have composed an *Odyssey* consisting of 24 books, excluding from the first book the letter A, from the second B, and so on: thus shewing the whole 24 letters, one after another, that he could do his business without them. It must have been very pleasant to have seen this poet making his escape through the several Greek dialects, when he was pressed with it in any particular syllable, with the same earnestness as another would avoid a false quantity; for the most apt and elegant word in the whole language was rejected, like a diamond with a flaw in it, if it appeared blemished with a wrong letter. In allusion to this, Mr. Addison says he saw in a dream the phantom of Triphidorus the Lipogrammatist engaged in a ball with 24 persons, who pursued him by turns through all the intricacies and labyrinths of a country dance, without being able to overtake him.

ALLIUM, from *αλεω*, to avoid, because many shun the smell of it: garlic; a genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking in the ninth order, Spathaceæ. The characters are: CAL. a common spatha, roundish, and multiflorous: COR. six oblong petals: STAM. six subulated filaments, often the length of the corolla; the anthers are oblong and erect: PIST. a germin above, shorter, nearly three-cornered, with angles engraved with a line; the styli are simple; the stigmata acute: PERICARP. a very short, broad, three-lobed capsule, with three cells and three valves: the seeds are many and roundish. Of this genus forty different species are enumerated by Linnæus, among which he includes the cepa and porrum, or onions and leeks.

1. **ALLIUM ASCALONIUM**, or eschalot, was found wild in Palestine by Dr. Hasselquist. The root of this species is very pungent, has a strong, but not unpleasant smell, and therefore is generally preferred to the onion for making high-flavoured soups and gravies. It is also put into pickles, and in the East Indies they use a great deal of it for this purpose.

2. **ALLIUM CEPÀ**, or common onion, differs from the garlic only in the swelling pipy stalk, which is much larger in the middle than at either end. From whence this was first brought into Europe is not known; but that it is natural to Africa is beyond a doubt, it being evident that onions were eaten by the Egyptians about 200 years before Christ; and they make a great part of their constant food to this day.

3. **ALLIUM PORRUM**, or leek, has been so long cultivated, that its native place of growth cannot be traced. It is the same as that mentioned in the eleventh chapter of Numbers, where it is said that the Israelites longed for leeks and onions. Their general use as a pot-herb is well known.—Their culture is the same with that of the onion.

4. **ALLIUM SATIVUM**, or garlic, has a bulbous root, of an irregularly roundish shape, with several fibres at the bottom; each root is composed of a number of lesser bulbs, called cloves of garlic, enclosed in one common membranous coat, and easily separable from one another. All the parts of this plant, but more especially the roots, have an acrimonious, and almost caustic taste, with a strong offensive smell, which last has induced those who preserved some of the species in gardens, on account of their yellow flowers, to eradicate them.

5. **ALLIUM SCHOENOPRASUM**, or cives, is an inhabitant of Siberia, and a very small plant compared with the former. Its taste, smell, and virtues, are much the same as those of the common onion.

6. **ALLIUM SCORODOPRASUM**, or rokambole, grows naturally in Denmark and Sweden.

7. **ALLIUM URISNUM**, or wild garlic, is very common and useful in Kamschatka for medicine as well as food. Both Russians and natives gather it in great quantities for winter service. They steep it in water, then mix it with cabbage, onions, and other ingredients, and form out of them a ragout which they eat cold. It is also the principal remedy for the scurvy. As soon as

this plant appears above the snow, they seem to put this dreadful disorder at defiance, and find a cure almost in its worst stages.

ALLIX, (Peter, D. D.) a learned French Protestant born at Alençon in 1641, and minister of the reformed church at Rouen, where his reputation as an author induced the reformed to call him to Chanenton, about a league from Paris, being the principal church they had in France. On the revocation of the edict of Nantz, he retired to England; and studied the language with much success, leaving behind him many testimonies of his literary abilities, and theological zeal. Among the number of his writings are

1. *Dissertatio de Sanguine D. N. I. Christi.*
2. *Dissertatio de Tertulliani Vita et Scriptis.*
3. *Les Maximes du Vrai Chretien*, joined with *Bonnes et Saintes Pensées pour tous les Jours du Mois*, Amsterdam, 1687.
4. *Reflections upon the Books of the Holy Scriptures, to establish the Truth of the Christian Religion*, republished by Bishop Watson in his *Tracts*.
5. *Some Remarks upon the Ecclesiastical History of the ancient Churches of Piedmont*, 4to. London, 1690.
6. *Remarks upon the Ecclesiastical History of the ancient Churches of the Albigenses*, 4to. Lond. 1692.
7. *The Judgment of the ancient Jewish Church against the Unitarians, &c.* Of this last work bishop Horsley speaks highly in his controversy with Dr. Priestley. He was complimented with the degree of D. D. and in 1690 was made treasurer of the church of Salisbury. He died in 1717.

ALLOA, a town and parish of Scotland, in the county of Clackmannan, extending about four miles from east to west and about two from north to south, containing about 3900 acres. The Forth is its southern boundary, and the course of the river is so circuitous, that its banks on the border of the parish measure five miles and a half. Upon the west it is watered by the Divon, which joins the Forth about a mile from Tullibody, and has a pier built at its mouth, where vessels of tolerable burden can load. The climate is good, and the soil various. The rivers produce salmon, trout, &c. and the coast is frequented by sturgeons, soles, turbots, skate, haddocks, Congo eels, &c.; and a peculiar species of herrings, called *GANDANOOKS*, which see. Upon the eastern extremity of the parish there is an artificial lake, turning various mills, cleansing the harbour, &c. On the north-east extremity is the elegant seat of Shaw Park. The colliery affords employment to many of the inhabitants, and furnishes 35,000 tons of coal annually for export. The machinery used is excellent. There were formerly 100 looms employed in the manufacture of camblets, but these are now almost wholly discontinued; as well as the manufacture of serges and inferior woollen stuffs. Here are two extensive distilleries, two celebrated breweries, tanneries of repute, and a glass manufactory of great extent.

The town of Alloa was the Alauna of the ancient Romans, and is seated on the north side of the Forth, seven miles east from Stirling by land, but above seventeen by water, about thirty-two north-west from Edinburgh by land, and twenty-seven and a half higher up the Frith than Leith. It is pleasantly situated and contains

from 5000 to 6000 inhabitants. It has two market days in the week, and four annual fairs. Alloa is remarkable for its fine castle, the seat of the ancient earls of Mar, and for the coal mines near it. The harbour is extremely commodious, with great depth of water; enabling vessels to load expeditiously. An excellent dry dock has been erected, capable of receiving ships of the reatest burden: and above the dock there is a ferry, with two very complete piers, one on each side of the river. The tower and lands of Alloa were exchanged by David II. king of Scots, in 1365, with Thomas Erskine, for the lands and estate of Strathgartney in Perthshire; and since that period the castle of Alloa has been the favourite residence of the family of Mar. The turret of the tower is eighty-nine feet in height; and the walls are eleven feet in thickness. It was built in the end of the thirteenth century. Its situation is uncommonly beautiful. The gardens were the first that were laid out on a great scale in Scotland; they contain about forty acres. In this residence of the family of Erskine, many of the Scottish princes received their education, having been for more than two centuries the wards of the lords Erskine and earls of Mar. The last heir of the Scottish monarchy who was nurtured in it, was Henry, prince of Cumberland, son of king James VI. The streets of Alloa are, in general, narrow and irregular; but there is one, called John's street, built by the late earl upon a regular plan, which runs in a line parallel to the gardens, and leads to the harbour, between seventy-six and eighty feet broad, and terminating in a beautiful gravel walk. A row of lime-trees on each side adds to its beauty, and affords an agreeable shade in summer. The church of Alloa is rather small for its population. It has a post-office and custom-house; a subscription library, on a respectable footing; and contains a burgher, antiburgher, and relief meeting houses. Alloa is governed by a baron-bailie. Market on Saturday.

ALLÖBROGES, from Allobrox: a people of Gallia Narboneus, situated between the Isara and the Rhone, and the lake Lemanus: commended by Cicero for their fidelity; but censured by Horace on account of their fondness for novelty. *Epod. 16, v. 6.*

Novisque rebus infidelis Allobrox.

ALLOBROX, a ancient history, a name given by Berossus to the fifteenth king of the Gauls; whence some have derived the name of the Allobroges. *Dupleix, Mem. des Gaules, 1. 2. c. 16.*

ALLOCATION, in law, an allowance made on account in the Exchequer.

ALLOCATIONE FACIENDA, a writ for an accountant to receive such sums from the treasurer as he has expended. *Reg. Orig. 206.*

ALLOCATO COMITATU, in law, a new writ of exigent allowed before any county court holden, on the former not being fully served or complied with.

ALLOCATUR, in law, i. e. it is allowed; a term applied to the certificate of allowance by the master on taxation of costs.

ALLOCHIROITE, in mineralogy, an opaque

garnet, of a greyish, yellowish, or reddish-brown. Quartz scratches it, but it strikes fire with steel. It has externally a glistening, and internally a glimmering lustre. Its fracture is uneven, and its fragments are translucent on the edges: sp. gr. 3.5 to 3.6. It melts before the blowpipe into a black opaque enamel. Vauquelin's analysis the following: Silica 35, lime 30.5, oxide of iron 17, alumina 8, carbonate of lime 6, oxide of manganese 3.5. M. Brogniart says it is absolutely infusible without addition, and that it requires a flux, as phosphate of soda or ammonia. With these it passes through a beautiful gradation of colours. It is covered at first with a species of enamel, which becomes on cooling; reddish-yellow, then greenish, and lastly of dirty yellowish-white. He represents it as rather difficult to break. It was found by M. Dandrade in the iron mine of Virums, near Drammen in Norway, and is accompanied by carbonate of lime, protoxide of iron, and brown garnets.

ALLOCUTIO, in Roman antiquity, the oration of a general addressed to his soldiers to animate them to fight, to appease sedition, &c. A mount of earth was frequently raised on the occasion, and from this the general pronounced his harangue to the several squadrons around him.

ALLOCUTION, n. or *Ad: loquor, locutus,* *Adlocution,* *to speak to.* Addressing the speech to.

Upon such a high tribunal or scaffold [the *truncus*, or *pulpit*] we often see the emperor standing, and sometimes sitting in medals and ancient bass-relievoes; both in *allocutions* to the army, and in distributing their bounty to the people.

Sir G. Weeler, on the Churches of the Prim. Chris.

ALLODIARIUS, in feudal customs, the proprietor of allodial lands; also a lord paramount of a manor. See next article; also FEE and FEUDAL.

ALLODIUM, most probably of German original: a possession held in absolute independence, without any acknowledgment of a lord paramount. It is opposed to fee, or feudum, which intimates some kind of dependence. There are no allodial lands in England, all being held either mediately or immediately of the king.

ALLOEOTHETA, in rhetoric, *ἀλλοιοθέτα;* from *ἄλλος* various, *θέτει* disposed: a figure of grammar varying from the ordinary rules of syntax, as a noun in the singular with a verb plural, *Pars abiere.*

ALLOGIA, in antiquity, of locus, Lat. a place: winter quarters appointed for the soldiery.

ALLOGNE, in military affairs, the cordage used with floating bridges, by which they are guided from one side of a river to the other.

ALLOISI, BALDASSARE, a celebrated painter of Bologna, who obtained the name of Galanino. He was born in 1578, and studied under the Caracci, whose style he retained in all his compositions. The Italians have considered him a second Vandyck. He died in 1638.

ALLONBY. See ALANBY.

ALLONGE. n. s. *allonge*, Fr. 1. A pass of thrust with a rapier, so called from the lengthening of the space, taken by the fencer. 2. It is

likewise taken for a long rein, when the horse is trotted in the hand.

ALLOO', interj. { Loo, aloo, halloo, 'lo, imperative of the verb look, or HALLOO'. Alew is found in Spenser.

Awhile she walkt and chauft; awhile she threw Herself upon her bed and did lament:
Yet did she not lament with loude alew.
As women wont, but with deepe sighes and singulfes few. *Spenser's Faerie Queene*, book v. c. vi.

List, list; I hear

Some far off halloo break the silent air.

Milton's Comus.

Alloo thy furious mastiff, bid him vex
The noxious herd, and print upon their ears
A sad memorial of their past offence. *Philipps.*

ALLOOR, a town of Hindostan, in the Northern Carnatic, 114 miles north of Madras. N. lat. 14°. 40'. E. long. 80°. 3'.

ALLOPHANE, in mineralogy, a stone of a blue, and sometimes a green or brown colour, which occurs massive, or in imitative shapes. Lustre vitreous; fracture imperfectly conchooidal; transparent or translucent on the edges. Moderately hard, but very brittle. Specific gravity 1.89. Composition, silica 21.92, alumina 32.2, lime 0.73, sulphate of lime 0.52, carbonate of copper, 3.06, hydrate of iron 0.27, water 41.3. Stromeier. It gelatinizes in acids: it is found in a bed of iron-shot limestone in greywacke slate, in the forest of Thuringia.

ALLOPHESES, *ἀλλοφασίς*, in medicine, is speaking of things differently from what they are, delirium.

ALLOPHYLLUS, in botany; a genus of the monogynia order, belonging to the octandria class of plants. The characters are: CAL. a four leaved perianthium, with orbicular leaflets, the opposite ones less: COR. four orbicular equal petals, less than the calyx; the claws broader, the length of the smaller leaves of the calyx: STAM. eight slender filaments, the length of the corolla: the ANTH. are roundish: PIST. a round didymus germin above; the stylus filiform, longer than the stamna; and the stigma bifid, with revolute divisions. There is but one species, viz. allophyllus zeylanicus, a native of Ceylon.

ALLORI, Alexander, or Bronzino, a painter of Florence, who successfully followed Michael Angelo, and died in 1607, after having gained a great reputation.

ALLORI, Christophano, son and disciple of the preceding, was born 1577, and died at the age of 42, leaving many small pictures, executed with remarkable correctness and delicacy.

ALLOT', v. According to Tooke, the

ALLOT'MENT, { Ang. Sax. *lot* or *hlot* is the ALLOT'TERY. } regular past tense of hliban, to cover, and means something covered. Hence, probably, the verb *allot*. To put to *lot*; to distribute by *lot*; parcel out; to give; grant; apportion.

Thy self content with that is the assinde

And use it well that is to the *allotted*. *Wyatt.*

OLL. Let me go, I say.

ORLA. I will not till I please: you shall hear me. My father charged you in his will, to give me good education: you have trained me up like a peasant, obscuring and hiding me from all gentleman-like

VOL. I.

qualities; the spirit of my father grows strong in me, and I will no longer endure it: therefore allow me such exercises as may become a gentleman, or give me the poor *allottery* my father left me by testament, with that I will go and buy my fortunes.

Shakespeare's As you like it.

Five days we do *allot* thee for provision,
To shield thee from disasters of the world;

And on the sixth to turn thy hated back

Upon our kingdom. *Shaksp. King Lear.*

I shall deserve my fate if I refuse

That happy hour, which heaven *allots* to peace.

Dryden.

There can be no thought of security or quiet in this world, but in a resignation to the *allotments* of God and nature. *L'Estrange.*

Though it is our duty to submit with patience to more scanty *allotments*; yet thus much, we may reasonably and lawfully ask of God.

Rogers's Sermons.

It is laid-out into a grove, for fruits and shade; a vineyard; and an *allotment*, for olives and herbs.

Browne.

Since fame was the only end of all their studies, a man cannot be too scrupulous in *allotting* them their due portion of it. *Tatler.*

Of memory, which makes so large a part of the excellence of the human soul, and which has so much influence upon all its powers, but a small portion has been *allotted* to the animal world. *Rambler.*

ALLOY. See **ALLAY**.

ALLOY, or **ALLAY**, *alliage*, Fr. *Legieren metallversetzung*, Germ. *lega*, Ital. This word is supposed to be derived through the French language, from the Latin, ad-ligatio; which signifies the act of tying, binding, or connecting together. The term formerly was almost wholly confined in England to the goldsmiths, and the mint, where it was appropriated to the lowering of the purity of gold or silver, previous to its being coined, and hence seems gradually to have assumed the meaning of the English verb, to allay, i. e. to abate, to lower. All the other known combinations of metal with each other, were simply called 'mixed metals,' but the term alloy, has at length been made to comprehend all the binary and more complicated metallic compounds. Those of which mercury makes a part, are generally known by the name amalgam.

An alloy, therefore, amongst philosophical chemists, may be defined a combination of any two or more metals into one homogeneous mass to the exclusion of more mechanical mixtures. The most valuable and useful of these have acquired particular names, as brass; which is an alloy of copper and zinc; bell-metal which is an alloy of copper and tin, &c. When any precious metal is mixed with another of less value, the assayers call the latter the alloy.

Every alloy is distinguished by the metal which predominates in its composition, or which gives it its value. Hence, English jewellery trinkets are ranked under alloys of gold, though most of them deserve to be placed under the head of copper. Since there are about 30 different permanent metals, independent of those evanescent ones that constitute the bases of the alkalies and earths, there ought to be about 870 different species of binary alloy. Only 132 species, however, have hitherto been made and examined. Some metals have so little affinity

to others, that no compound of them has yet been effected. The most common obstacles to alloying, arise from the difference in fusibility and volatility. Yet some metals are known whose melting point is nearly the same, which refuse to unite. No two bodies will combine, unless their affinity or reciprocal attraction be stronger than the cohesive attraction of their individual particles. It is in order to overcome this cohesion of the solid bodies, and to render affinity predominant, that they are penetrated by caloric. If one be very difficult of fusion, and the other very volatile, they will not unite unless the reciprocal attraction be exceedingly strong. But if their degree of fusibility be almost the same, it is otherwise. Alloys in their physical properties have the closest relations with the metals. They are a solid at the temperature of the atmosphere, except some few amalgams: they possess metallic lustre, are opaque, and dense in a greater or less degree according to the metals which compose them. They are excellent conductors of electricity, and crystallize more or less perfectly. Some alloys are brittle, others ductile and malleable: some have a peculiar odour, and some are sonorous and elastic. An alloy consisting of metals differently fusible, is usually malleable while cold, but brittle while hot. We see this exemplified in the case of brass.

With regard to the density of an alloy, we observe that it is sometimes greater, and sometimes less than the mean density of its component parts, which evinces a diminution or augmentation of volumes, at the instant of their union. The relation between the expansion of the separate metals and that of their alloys has been in some cases investigated. Alloys containing a volatile metal are decomposed, either in whole or in part; a fact which is exemplified at a strong heat, in the case of arsenic, mercury, tellurium and zinc. Those that consist of two metals differently fusible may be often decomposed by eliquation, or exposing them to a temperature capable of melting only one of them. This mode is employed to extract silver from copper. Argentiferous copper is melted with $3\frac{1}{2}$ times its weight of lead; and the triple alloy being exposed to a sufficient heat, the lead carries off the silver in its fusion, and leaves the copper under the form of a spongy lump. By a subsequent operation the silver is recovered from the lead.

'Some alloys,' says an intelligent author, 'oxidize more readily by heat and air, than when the metals are separately treated. Thus 3 of lead, and 1 of tin, at a dull red, burn visibly, and are immediately oxidized. Each by itself, in the same circumstances, would oxidize slowly, and without the disengagement of light.'

The formation of an alloy must be regulated by the nature of the particular metals; the degree of affinity between metals may be in some measure estimated by the relative facility with which, when of different degrees of fusibility or volatility, they unite, or with which, when united, they can be separated by heat. The degree of tendency to separate into different proportional alloys, by long continued fusion, may also throw additional light on this subject. Mr. Hatchett

in his researches on metallic alloys, remarked, that gold made standard, with the usual precautions, by silver, copper, lead, antimony, &c. and then cast into vertical bars, was by no means a uniform compound; but that the top of the bar, corresponding to the metal at the bottom of the crucible, contained the larger proportion of gold. Hence, for thorough combination, two red-hot crucibles should be employed; and the liquefied metals should be alternately poured from the one into the other. And to prevent unnecessary oxidizement by exposure to air, the crucibles should contain, besides the metal, a mixture of common salt and powdered charcoal. The melted alloy should also be stirred occasionally with a rod of pottery.

The most direct evidence of a chemical change having taken place in the two metals by combination, is when the alloy melts at a lower temperature than the fusing points of its components. Iron, which alone is nearly infusible, when alloyed with gold acquires almost the fusibility of this metal. Tin and lead form solder, which is more fusible than either of its components, and the triple compound of tin, lead, and bismuth illustrates this remark in a still more striking manner. The analogy is here strong, with the increase of solubility which salts acquire by mixture, as is exemplified in the uncry stallizable residue of saline solutions. Sometimes two metals will not directly unite, which yet, by the intervention of a third, are made to combine. Thus, mercury and iron have been made to amalgamate by previously uniting the iron to tin or zinc. The tenacity of alloys, generally speaking, is inferior to the mean of the separate metals. One part of lead will destroy the compactness and tenacity of a thousand of gold. Brass made with a small proportion of zinc, is more ductile than copper; but when one-third of zinc enters into its composition, it becomes brittle.

In common cases, the specific gravity affords a good criterion whereby to judge of the proportion in an alloy, consisting of two metals of different densities. A very fallacious rule has nevertheless been given in some respectable works, for comparing the specific gravity that should result from given quantities of two metals of known densities in a state of alloy, supposing no chemical penetration or expansion of volume to take place. Thus it has been taught, that if gold and copper be united in equal weights, the mathematical specific gravity of the alloy is the arithmetical mean of the two specific gravities. Referring the details to the article specific gravity, the correct rule is as follows: The specific gravity of the alloy is found by dividing the sum of the weights by the sum of the volumes; compared to water, reckoned unity.—Let the sum of the weights be multiplied into the product of the two specific gravities for a numerator, and each specific gravity into the weight of the other body, and the two products added together for a denominator. The quotient then obtained by dividing the numerator by the denominator, compared with this, is the true computed mean specific gravity; and that found by experiment will show whether expansion or condensation

volume has attended the combination. Gold having a specific gravity of 19.36, and copper of 8.87, being alloyed in equal weights, give on the fallacious rule of the arithmetical mean of the densities, $\frac{19.36 + 8.87}{2} = 14.11$; whereas the

8

true mean specific gravity is only 12.6. It is evident, that by comparing the former number with chemical experiment, we should be led to infer a prodigious condensation of volume beyond what really occurs,

Mr. Hatchett observed upon the density of metals, that when a bar of gold was cast in a vertical position, the density of the metal at the lower end of the bar, was greater than that at the top, in the proportion of 17.364 to 17.035.

From the above fact some authors have inferred that melted metal is a compressible fluid, and that particles passing into the solid state under pressure, exert a superior degree of cohesive attraction. On this subject, however, we shall leave the reader to form his own conclusion.

Upon the whole, since we are far from knowing all the binary alloys, which are possible,

and still further from knowing all the triple, quadruple, alloys, &c. which may exist, we must confess, with Dr. Thomson, that the chemistry of alloys is at present but little understood, and that these compounds at present are much better known to artists and manufacturers than to chemists. The following tabular views from this intelligent author, exhibit the general properties of the different alloys, as far as they have been accurately examined, and with them we shall close the present article.

The first of these tables comprehends the alloys of the malleable metals with each other; the second, the alloys of the brittle metals; and the third, the alloys of the malleable and brittle metals. In these tables, the letter M signifies malleable; B, brittle; S, submalleable, used when the alloy is malleable in certain proportions, but brittle in others. O is used when the metals do not unite. The sign + is used when the alloy occupies a greater bulk than the separate metals; the sign — when the alloy occupies a smaller bulk. The first indicates an expansion; the second a condensation.

ALLOW', v. Of unsettled etymology. Some derive it from the Latin *adlaudare*. Others contend for its northern origin, as if its root was *allow'*, *ligan*, to lay; to low or lower, [claims or pretensions.] There is little doubt but it comes immediately from the French, *allower*. Its principal synonyms are, to admit; grant; yield; permit; approve; concede; sanction; give up; set apart to a specific use.

pe gode bisshop Antoyn per he bare pe pris,
His dedes ere to *alowe*, for his hardynesse.

R. Brunne, p. 281.

For selde it is, that loue *alloweth*
The gentill man withouten good,
Though his condicion be good.

Gower Con. A. book iv.

þy lord lokeþ to have *allowance* for his bestes,
And of þe monye þow haddist þr myd.

Vision of Pier's Ploughman.

So ar his errors manifold, that many words dothe use,
With humble secret playnt, fewe words of hotte effect,
Honor thy lord; *allowance* vaine of voyd desert neglect.

Surrey.

The pow'rs above

Shakesp.

Allow obedience.

Bible.

The Lord *alloweth* the righteous.

It is not *allowable*, what is observable in many pieces of Raphael; where Magdalen is represented before our Saviour, washing his feet on her knees; which will not consist with the text.

Brown's Vulgar Errours.

In actions of this sort, the light of nature alone may discover that, which is in the sight of God *allowable*.

Hawker.

I was, by the freedom *allowable* among friends, tempted to vent my thoughts with negligence. Boyle.

Reputation becomes a signal and a very peculiar blessing to magistrates; and their pursuit of it is not only *allowable* but laudable.

Atterbury's Sermons.

The principles, which all mankind *allow* for true, are innate; those, that men of right reason admit, are the principles *allowed* by all mankind. Locke.

The pow' of musick all our hearts *allow*;

And, what Timotheus was, is Dryden now. Pope.

That some of the Presbyterians declared openly against the king's murder, I *allow* to be true. Swift.

If we consider the different occasions of ancient and modern medals, we shall find they both agree in recording the great actions and successes in war; *allowing* still for the different ways of making it, and the circumstances that attended it. Addison.

The ruin'd spendlift, now no longer proud,

Claim'd kindred there, and had his claims *allow'd*.

Goldsmith's Deserted Village.

ALLOW, EAST, a river of Durham, which runs into the Tyne.

ALLOW, WEST, a river of Northumberland, which runs into the Tyne; also a river of the isle of Anglesea.

ALLUCIUS, in ancient history, a prince of the Celiberi, to whom Scipio Africanus restored his beautiful bride, who had fallen into his hands in war. Plutarch calls him Lucecius.

ALLUDE', v. Ad: *ludo*, to play or sport

ALLU'SION, } with, about, or near: re-

ALLU'SIVE, } ferring primarily to what is

ALLU'SIVELY, } sportive or playful. Sub-

ALLU'SIVENESS, } sequently it signifies to fur-

nish hints or intimations; to convey insinuations, or make indirect observations.

These wordes, good readers, haue no great harme in them at the firste face. But they *allude* vnto certain woordes of Tyndall wyth whyche he argueth agaynst me.

Sir T. More's Workes, fol. 860.

As for the grace of the Latin tonge, I think vnpossible to bee liuely expressed, as this autour doeth it in the Latin by reason of soundrie *allusions*, diuerser proverbes, many figures, and exornacions rhetoricall.

Udall. Preface to St. Luke.

These speeches of Jerom and Chrysostom do seem to *allude* unto such ministerial garments, as were then in use.

Hawker.

Here are manifest *allusions* and footsteps of the dissolution of the earth, as it was in the deluge, and will be in its last ruin.

Burnet's Theory.

This last *allusion* gall'd the Panther more;
Because indeed it rubb'd upon the sore.

Dryden.

Expressions now out of use, *allusions* to customs lost to us, and various particularities, must needs continue several passages in the dark.

Locke.

The Jewish nation, that rejected and crucified him, within the compass of one generation, were, according to his prediction, destroyed by the Romans, and preyed upon by those eagles (Matt. xxiv. 28.), by which, *allusively*, are noted the Roman armes, whose ensign was the eagle.

Hammond.

Where the expression in one place is plain, and the sense affixed to it agreeable to the proper force of the words, and no negative objection requires us to depart from it; and the expression, in the other, is figurative or *allusive*, and the doctrine deduced from it liable to great objections; it is reasonable, in this latter place, to restrain the extent of the figure and *allusion* to a consistency with the former.

Rogers's Sermons.

ALLUM. See **ALUM**.

ALLUM BAY lies round the Needles Point, or north-east from the rocks so called, at the west end of the Isle of Wight, on the coast of Hampshire. It has good anchorage, with a sufficient depth of water, not far from the bottom o' the bay, and out of the strong run of the tide, which is frequently very rapid here.

ALLUMEE, *allumé*, French, in heraldry, denotes the eyes of an animal when they are represented light or sparkling, and of a different colour from the animal itself, as when they are red, and the animal proper. Also applied to the flame of a torch, when illumined, and the handle itself is of the colour of nature.

ALLURE', v. & n. A *leurre*, Fr. to call or

ALLURE'MENT, } beckon to the *lure*, or ar-

ALLUR'ER, } tificial bird exhibited in

ALLUR'ING, } order to call off the hawk

from his prey—a term of falconry. To practise art with a view to entice; to call in order; to deceive; to tempt. Sometimes used in a good sense.

Vpce þe alurs of þe castles þe laydes þanne stode,
And byhulde þys noble game, and whýche kynys
were god.

R. Gloucester, p. 192.

What shoulde I speake of the other lesse culs, that he *aleured* and aleected her with, as the pleasure of the eye in the beholdynge of that frute, wthy likorous desyre of the delicious taste.

Sir T. More's Workes, fol. 1274.

An eye whose judgment no effect could blind,
Friends to *allure*, and foes to reconcile;

Whose piercing look did represent a mind
With virtue fraught, reposed, void of guile.

Earl of Surrey's Poems.

Unto laws that men make for the benefit of men,
it hath seemed also needful to add rewards; which
may more allure unto good, than any hardness de-
terreth from it; and punishments, which may more
deter from evil, than any sweetness thereto allureth.

Hooker.

Hunger and thirst at once
Powerful persuaders! quickened at the scent
Of that alluring fruit, urg'd me so keen.

Milton's Par. Lost.

Against allurement, custom, and a world
Offended; fearless of reproach and scorn,
Or violence.

Id.

The golden sun, in splendour likest heav'n,
Allur'd his eye.

Id.

—Adam, by his wife's allurement, fell.

Paradise Regained.

To shun th' allurement is not hard;
To minds resolv'd, forewarn'd, and well prepar'd;
But, wond'rous difficult, when once beset;
To struggle through the straits, and break th' involv-
ing net.

Dryden.

The rather to train them to his allure, he told them
both often, and with a vehement voice, how they
were over-topped and trodden down by gentlemen.

Hayward.

Each flatt'ring hope, and each alluring joy.

Lyttleton.

He tried each art, reprov'd each dull delay,
Allur'd to brighter worlds and led the way.

Goldsmith.

ALLUSH, or rather ALUSH, in ancient geography, a place in Palestine, where the Israelites encamped, Numb. xxxiii. 13, supposed by Eusebius, Jerome, and Ptolemy, to have belonged to Idumaea, and to have been situated near Petra, the capital of Arabia Petraea.

ALLUSION, from ad, to, and *ludere*, to play, in rhetoric, a figure originating in a comparison or association of ideas, suggested by some similitude of name, sound, or circumstances. Camden defines allusion playing with words alike in sound, but unlike in sense; whence words resembling one another become applicable to different subjects; in which sense it is synonymous with punning. Thus the Romans played on their tippling emperor Tiberius Nero, by calling him Biberius Mero; and thus in Quintilian the sour fellow Placidus is called Acidus. But allusion has, in modern times, a more extended and important signification. We cannot illustrate its graver uses better than by the following fine passage of Dr. Ogilvie's respecting religious controversy. 'If it be the obscure, the minute, the ceremonial parts of religion for which we are contending, though the triumph be empty, the dispute is dangerous; like the men of Ai we pursue, perhaps, some little party that lies before us, and are anxious that not a straggler should escape, but when we look behind us we behold our city in flames.' Pope illustrates its admirable service in irony, alluding to Denton's well-known passage respecting the Thames:

Flow, Welsted, flow! like thine inspirer, beer:
Though stale, not ripe; though thin, yet never clear;
So sweetly mawkish, and so smoothly dull;
Heady, not strong; o'erflowing, though not full.

Pope. The Dunciad, book iii.

ALLUT, a large village of Ceylon, north-east of Candy, from which it is distant about fifteen miles.

ALLUVION, n. Ad: *luo, lutum*, to wash to; the washing away; the washing up of sand or earth, so as to form a mud soil.

Some rivers by insensible *elluvions* take in and let out the waters that feed them, yet they are said to have the same beds.

Howell's Letters.

ALLUVION, from *adluo*, I wash to, compounded of ad and lavo; in law, a gradual increase of land along the sea-shore, or the banks of large rivers. The civil law places alluvion, among the lawful means of acquisition; and defines it to be latent, imperceptible accretion. But where any considerable portion of ground is torn away at once by an inundation, and joined to some neighbouring estate, this is not acquired by right of alluvion, but may be claimed again by the former owner. Great alterations are made in the face and limits of countries by alluvions of the sea, rivers, &c. whose plains are sometimes formed by alluvions.

ALLY, v. & n. Fr. *allier*, to fasten

ALLIANCE,

attach to; from the Latin *alliance*,

ALLIANT. *Adligo*, to join, unite, by kindred, marriage, friendship, confederacy, or resemblance.

Gisors my gode cite, with alle pe purueiance,
Richard I gaf it fre, to mak pis alliance.

R. Brunne, p. 156.

Or to adione vp fryendschip and ally,
With Tirrhene pepill and folk of Tuskany?

Douglas, b. x. p. 315.

SIL. If this man
Had but a mind allied unto his words,
How blest a fate were it to us and Rome.

Ben Jonson's Sejanus, act. i. sc. 2.

He in court stood on his own feet; for the most of his allies, rather leaned upon him, than shored him.

Watt.

We could hinder the accession of Holland France; either as subjects, with great immunities the encouragement of trade; or as an inferior and dependent ally, under their protection.

Tenny.

Two lines are indeed remotely allied to Virgil's sense; but they are too like the tenderness of Ovid.

Dryden.

Remembrance and reflection how allied,
With thin partitions, sense from thought divide.

Pope.

Wants, frailties, passions, closer still ally
The common int'rest, or endear the tie.

Ib.

To the sun ally'd,

From him they draw the animating fire.

Thomson.

Time was, ere yet in these degenerate days
Ignoble themes obtained mistaken praise;

Watt.

When sense and wit with poesy allied,
No fabled graces, flourished side by side,

Watt.

From the same fount their inspiration drew,
And reared by taste, bloomed fairer as they grew.

Lord Byron's English Bards and Scotch Reviewer.

ALLY, (Vizier,) ex-nabob of Oude, was the adopted son of Ausuf ab Dowlah, late nabob of Oude. His reputed father, a wealthy and eccentric prince, who had succeeded to the musnū or throne of Oude, under the protection of the British, was in the habit, whenever he saw a pregnant woman whose appearance pleased him, of

inviting her to his palace to lie in; such an one was the mother of vizier Ally, in 1781, and her child, engaging the affections of the nabob, was by him finally adopted as his successor. Vizier Ally accordingly succeeded, but was deposed by the English government in favour of the brother of the late nabob; and a pension of two lacs of rupees, or £25,000 sterling settled on him. Proceeding to Benares, where Mr. Cherry the company's agent was despatched to make arrangements for his future residence, he came to breakfast with Mr. C. attended by an armed retinue, and, after complaining bitterly of the treatment which he had received from the Indian Company, gave a signal, on which his followers rushed in and cut to pieces Mr. Cherry and his assistant Mr. Graham. Ally made his escape into the territory of Berar; but was at length given up, on condition that his life should be spared. He died in confinement in May, 1817.

ALLYGUNGE, a town of Bengal, in the district of Purneah, forty miles north-north-east of the town of that name. N. lat. 26°. 16'. E. long. 87°. 38'.

ALMACANTAR, in astronomy, **ALMINCANTARAH**, from the Arabic Almocantharat; a name for the parallels of altitude on the celestial globe, whose zenith is the pole or vertical point.

ALMACANTER'S STAFF is an instrument for observing at sea the sun's amplitude rising and setting.

ALMADA, a town in Portuguese Estremadura, on the Tagus, opposite Lisbon.

ALMADÉ, a town of Spain, in the province of La Mancha, and kingdom of Castile, situated upon the top of a mountain, where are some of the most ancient silver mines in Europe.

ALMADEN, a town of Seville, in Andalusia, near which there are also silver mines.

ALMADEN DE LAZOGUE, a town of Spain, in Mancha, famous for its rich mines of mercury and vermillion. It is forty-five miles south-west of Ciudad Real.

ALMAIME, in commercial affairs, a small vessel or canoe, used by the negroes of Africa, about four fathoms long, and made usually of the bark of a tree. This name is also given to the vessels of Calicut, in India, called likewise cathuri. They go with great swiftness.

ALMAGEST, in antiquity, a celebrated book, composed by Ptolemy; being a collection of the observations and problems of the ancients, relating to geometry and astronomy. In the original Greek it was called *συντάξις μηχανῆ*, i. e. greatest construction, or collection: which last word *megiste*, joined to the particle *al*, gave occasion to its being called almagest by the Arabians, who translated it into their language about the year 800. The Arabic word is almaghest. Ricciolus also published a body of astronomy, which he entitled, the New Almaghest; being a collection of ancient and modern discoveries in that science.

ALMAGRA, in chemistry, red bōle or ruddle; sometimes a lotion, or wash.

ALMAGRA, in natural history, the sil atticum of the ancients, an ochre of a fine and deep red, with some mixture of purple, very heavy, and of a dense yet friable structure, and rough dusty surface. It adheres firmly to the tongue, melts

easily in the mouth, and is of an austere and strong astringent taste. It stains the skin, and ferments very violently with acid menstruums; by which quality it is sufficiently distinguished from the sil syricum, to which it has in many respects a great affinity. It is found in immense quantities, in many parts of Spain; and in Andalusia there are in a manner whole mountains of it. It is used both in painting and in medicine, being a very valuable astringent.

ALMAGRO, a fortress of Spain, the capital of one of the districts of La Mancha. It was built by the archbishop Roderic of Toledo, who finished it in 1214; and put a considerable garrison into it, to restrain the incursions of the Moors.

ALMAGRO, (Diego de), a Spanish commander, of mean descent, who accompanied Pizarro in the expedition against Peru in 1525. He is accused of having given orders for the murder of Atahualpa the inca. In 1535 he took Cuzco, the capital of Chili, and reserved the plunder for himself, which giving offence to Pizarro's brothers, who were there, he made them prisoners, and a civil war ensued. For some time Almagro's party experienced great success; but at length he was taken prisoner, after an obstinate battle. He was kept in confinement several months, and strangled in 1538, aged seventy-five. His son Diego endeavoured to revenge his father's death, but failed in the attempt, and was beheaded by De Castro in 1542.

ALMAGUER, a city of South America, twenty-one miles south of Popayan, in the kingdom of Quito, and province of Popayan, founded in 1543, on the top of a small mountain. Its temperature is mild and pleasant, and in its district are some gold mines.

ALMAKERK, or **MALLENTROY**, a market town of Transylvania, upper county of Weissenburg.

ALMA MATER, in literature, a title given to Oxford, Cambridge, &c. by such as have received their education in these and other academic foundations.

ALMANCHERY, a town of Hindostan, in the Carnatic, about eleven miles north of Bommanezopalam.

ALMAMON, or **ABDALLAH**, caliph of Bagdad, was the son of Haroun Al Raschid, and succeeded his brother Al Amin in 813; he was a great patron of learning, and founded a celebrated academy at Bagdad. He calculated a set of astronomical tables, and caused the works of the most celebrated ancient authors to be translated into Arabic. He died in 833, exclaiming in the mortal struggle, 'Oh Thou that never diest, have mercy on me, a dying man!' His conduct towards his uncle and rival Ibrahim, was an unusual example of clemency and magnanimity. That prince, after his deposition, kept himself some years concealed in Bagdad. Being at length discovered, he was brought before the caliph, and told that the council had unanimously condemned him to death. 'Your counsellors (said Ibrahim) have judged according to the customary rules of political government; if you pardon me, you will not, indeed, judge according to precedent; but you will have no equal among sovereigns.' The caliph, raising

and tenderly embracing him, said, with great emotion, ‘ Uncle, be of good cheer—I will not do you the least injury ;’ and he not, only pardoned him, but bestowed upon him a rank and fortune suitable to his birth. When Almamon’s courtiers came in crowds to compliment him on this generous action, he exclaimed, in the fullness of his heart, ‘ Oh ! did men but know the pleasure I feel in pardoning, all who have offended me would come and confess their faults !
